The best plan is to have the brooders about two feet square, with one or two sides protected only by a loose carpet hung along them so that the chicks can enter or come out at pleasure. A small lamp, properly protected, is as cheap as anything to heat it. If the weather turns warm at night or during one's absence, the chicks come out if the brooder proves too warm. If they are shut in they suffer greatly, if not fatally, from excess of heat. If the brooder is not kept warmed all day it should be heated before dark, so that the chicks will be comfortable and quiet when they first enter. Eight by ten feet is room enough for flocks of chicks from thirty to fifty, the right number depending upon their size—the larger they are the smaller the number to the pen. While I find the large and small chicks agree perfectly, they look better when grouped according to size. Knowing the fighting proclivities, especially when feeding, of old fowls, I have been amused to see the good-nature with which a large chick will allow a small one to come up and carry off its tid-bits.

Chicks seem to harbor no malice or ill-will towards each other. This may, in a great measure, be owing to the presence of an abundance of food. The larger chicks are also willing to allow the little ones to nestle under them, often to the extent of being lifted off their feet and tumbled upside-down.

Boxes with a bag of feathers hanging from the top are sufficiently warm without other heat for the larger chicks in a room where the stove holds fire all night; but with chicks under three weeks of age, the cold makes them restless and uneasy all night, so that they do not thrive and they hurt each other crowding together.

Chicks raised by hand are very gentle, so that a fence two feet high will keep them in, especially if they are well fed, so that there is no disposition to trespass upon the neighboring pens. Then if they do fly over the little fences, they do no harm and can be easily caught and put back where they belong. One great trouble I have had in heating brooders is to utilize all the heat from the kerosene lamps and at the same time to prevent them from smoking so badly as to suffocate the chicks. At the end of twelve hours a lamp seems to get out of humor, and shows its ill-nature by beginning to smoke, when the heat from the chimney is allowed to pass outside, there is no danger from this smoke but then a large proportion of the heat is lost. We want to save all the heat and get none of the smoke. My plan is to let all the heat into the brooder; take every precaution I can to prevent the lamp from smoking by keeping the brass works very clean, and then provide means for the chicks to escape under the carpet front if they do get caught in the smoke. This they are not very bright at doing, so I take the precaution to refill the lamps and trim the wicks twice a day, and examine everything at least once during the night. In trimming lamps I find it better, even with the wicks of the oil stove, to pinch the charred wick off rather than to use shears, as then the flame burns much more evenly.

SUCCESS WITH POULTRY WITHOUT CAPITAL.

THERE is probably no delusion so universal among suburban people as the idea that any one can make a fortune, or at least a fine living, with poultry, if he only has sufficient capital to start the enterprise. Many of them have unlimited ideas as to the extent to which a poultry farm can be stretched. It is so easy to figure out a profit on paper; the chickens are so numerous that if one returns a profit, of course, the others will, which will soon pile up an immense aggregate.

This delusion has often taken possession of men of means, who, following the advice of some enthusiast or even of the books on poultry-raising, have expended many thousands in land, houses and hens, often collecting the latter by car-loads and having everything start off with a rush and ending with equal celerity and with much dearly bought experience of how to fail in poultry raising. If I contemplated going into the chicken business on a large scale, this is just the way I would *not* do it—capital or no capital. In this business a little experience is worth more than any amount of money, so far as making a pecuniary success of the enterprise is concerned. Chickens thrive just as well in a log hut or a clapboard shanty as they do in houses glazed and shingled, celled and wainscoted from top to bottom. There is decidedly nothing esthetic in the taste of a hen. The sole point on which failure or success in this business depends is the adaptability of the man to the occupation, and where this is lacking no amount of the conveniences that money can furnish will supply the want. Experience is of paramount importance, but like most kinds of effective medicine, the bitter part of it should be taken in small doses—too much of this sort at one time is apt to irritate the complaint it was intended to cure. Many a man has become heart-sick and abandoned the business on account of the troubles or failures that crowded upon him when he was too fresh in the business to know how to meet them on so large a scale, when, had he started in a modest way and gathered experience as he went along, the result would have been quite different.

My advice would invariably be to start on a small scale and let the business grow only as its legitimate demands may require. A few hens and an old shed will do for a start. If one is willing to stick to them, feed them and coddle them, watch their every movement until one becomes familiar with their peculiarities, their wants, their likes and their dislikes, their good habits and their bad ones, he will then be sufficiently posted to take command of a larger battalion. If then he sickens and tires—as he probably will—of the eternal worry of these restless creatures, when he gives them up the loss will not be so great nor the mortification of failure so conspicuous. By all means stick to a few until the hen-fever part of the passion for fowls is over. Not only should one confine his efforts to a few, but these should be common native fowls, for the simple reason that one knows not at first what branch of the business, if any, he may ultimately decide to follow. It is next to impossible to follow them all; no place is adapted to all on a large scale. We raise chickens for eggs, capons, fat fowls and broilers. Any one of these branches properly followed, will occupy the whole time of any one man. Which branch his taste will ultimately settle upon no one can tell until he tries. Therefore do I repeat—start with a few; have patience to work up by degrees, for without this virtue success need not be hoped for.

Then the habit of buying whatever you may think you need is a great mistake. No matter how much you may think you need a thing, the chances are a dozen to one that, if you will only wait, you will find you can get along without it, or some device will suggest itself to your mind by which the same end may be compassed without the outlay of money. Learn to trade for what you want, be that fowls or furniture. If glass is needed, get second-hand sash from hot-bed or window—that from either will last a life-time. Do not be in a hurry to buy feed at wholesale rates. There is always greater waste when feeding from a large supply than from a small one, probably enough to make up the difference between the rate of cost of each lot of feed. Husband your resources and try to make the profits grow out of your investment. Above all, keep strict accounts and have as little estimating about the business as possible. In my opinion the chicken business will pay; but only in the hands of the man who is not ashamed or afraid to build it up from a small beginning.

B. F. H.

CHICKEN CHOLERA.

IT is highly probable that cholera in fowls originates by contagion and is introduced into flocks either by newly acquired infected fowls, by infected manure or feathers, or sometimes by the bodies of dead birds brought into, or near the poultry yard by dogs or other animals. In most cases the disease can be traced to the first-mentioned source. As the virus remains in a fixed form it is not probable that the disease germs are taken up by the air but that they are taken into the body with food and other matter which has been contaminated.

Preventive measures, in this disease as, indeed, in most others when the causes and mode of propagation are known, are the safest resort. Where a flock of fowls is already infected, the first and most reliable symptom is the coloration of the kidney excretion which is voided by fowls with the offal. This, in health, is readily distinguished by its white appearance, but when the fowl is attacked by cholera this kidney excrement changes its color from white to pale, and then to deep yellow, and in extreme cases it becomes green. At about this stage an obstinate diarrhœa sets in. This symptom being discovered, the infected fowls should be at once killed, care being taken that no blood is left where the other fowls may get at it, and the bodies should be buried. The healthy birds should be removed to a clean piece of ground which is known to be free from the contagion, and the excrement of these fowls should be inspected daily to ascertain their condition, and to detect the sick birds. If the fowls can be separated into pens of three or four such detection will be hastened. Before placing the birds in new quarters it is well to fumigate them with sulphur, as the feathers are apt to convey the disease.

In case fowls are introduced from other localities where the disease has been raging, it is good policy to "quarantine" them, so to speak, for three weeks or so until they are known to be free from the disease. Any eggs brought from other places for hatching should be cleaned of any excrement which may be attached to them, and manure from infected yards should not be thrown upon land to which healthy fowls have access. By observing these precautions the disease may be excluded or exterminated. Cures have been effected by feeding cooked meal, red pepper, gunpowder and turpentine mixed together; also by placing water in which bi-sulphate of soda, in proportion of an ounce to a gallon, has been dissolved, where the fowls can drink it.

The Apiarian.

MARKETING HONEY.

IT is discouraging, to say the least, for a bee keeper to find that for some reason or other *his* honey does not bring as much in market as some one else's. After the great care he has exercised in wintering his bees, in separating and hiving them, or in removing them, perhaps, to the vicinity of groves of flowering trees so that he may reap the profits which his faithful workers will surely enable him to do, other things being favorable, he is liable to complain if the profits are not realized. But has he used care in marketing his honey crop? Sometimes a negative reply to this question will throw some light on his failure. Anything brought to a city market, be it fruit, flower or vegetable, will command a better price when neatly

put up or arranged than when the converse is the fact, and this is especially true of honey. The total amount of honey marketed in the United States is very large, and a difference of a cent or two on a pound from the price it might have brought if neatly put up, would amount to thousands of dollars annually.

Comb honey should be marketed in single comb sections and the glass be neatly cleaned from all propolis or wax. While accidents on the way to market cannot always be avoided, the honey should, at least, leave the apiary in good condition. Extracted honey in large quantities can be shipped quite as well in barrels as any way, while small quantities can be put up in tin pails or cans, or in common fruit jars. The crates to contain the boxes shou'd be made to hold not more than a dozen of them, as they can then be conveniently handled. J. W. D.

The Vineyard.

THE NIAGARA GRAPE.

"MR. GREEN, what is your opinion of the Niagara Grape, and the method adopted for its introduction. A circular was sent me offering 100 vines for $150, all the growth of wood for eight years to be returned to the company who send it out. Can you estimate how many cuttings a vine will make in eight years and what it will cost to cut and pack them for shipment? Suel Foster, Muscatine, Iowa."

I have never heard of any grapes being grown from the Niagara other than those on the grounds of the originator, and am of the opinion that it has not fruited elsewhere. The usual custom of sending to prominent pomologists vines or plants of new fruits, so that their adaptability to different sections of the county may be made manifest and weak points be discovered (and I never saw the variety of fruit that did not have some defect), has not been followed by the Niagara people, so far as I am aware For this reason no one can give an opinion of much weight as to how the grape will succeed over the country at large. There are indications in the character of the vine and fruit that would lead one to presume that it was well adapted to various sections, but I should not care to risk largely on such predictions. The natural inclination of seedlings is to succeed better where they originate than elsewhere. In parts of this country where fruits from other localities fail, local seedlings thrive famously. The Niagara is a great success at the place where it originated as regards vigor, health and productiveness, and in quality it is good enough for the present demands of the market, but critical men, like Charles Downing, would not enjoy it. Nevertheless, I think the quality will not generally be objectionable.

Assuming that it will cost five cents per vine each year to cut the wood and pack it, we must add 40 cents to the original price, which makes it $1.90; then estimating the wood for eight years to be worth $1.10 per vine (it would not be complimentary to put it at any less), this brings the price of the vines up to $3 each. For myself, I should prefer to pay $3 for vines of a valuable new variety and enjoy the privilege of propagating them, than halt that price and be restricted. When informed, some years ago, of the method proposed for the introduction of the Niagara, I said to myself "It will not be successful;' but events have proved that I underestimated the enthusiasm of the American people.

The Niagara Grape overshadows all other new white grapes as completely as the great Falls, bearing the same name, overshadows other like natural scenery. This is, in part, owing to its great merits as displayed at its home, and in part to the fact that other formidable rivals have not been very shrewdly placed before the public. There are three new white grapes offered, possessing remarkable characteristics—Niagara, Lady Washington and Pocklington. No person knowing these varieties equally well, would hastily pronounce on any one as possessing more points of merit than the others, yet all have their weak points. There are many other new white grapes of great promise, of which I have not seen enough to enable me to report on their merits; but I believe the day is not far distant when white grapes will be as plentiful and grown as cheaply as those of any other color. CHAS. A. GREEN.

Miscellaneous.

What Others Say.

WE have been much interested while reading the address of Mr. J. B. Olcott, delivered before the State Board of Agriculture of Connecticut. It is quite out of the line of the hashed up, dressed-up generalities so frequently prepared for such occasions. The subject was "The Agricultural Press," and we copy the following briefs:

"Now, modern science, religion and morals, let us hope, working hand in hand, are teaching us that culture for ourselves and culture for our gardens are interdependent and inseparable; joined together by eternal goodness and not to be sundered with safety by anybody. To rob the earth leads, like all wrong, to barbarism, as the care and culture of the earth, keeping it holy everywhere, as God pronounced it good, is the highest evidence and natural accompaniment of the truest civilization.

The newspaper of to-day, like the vegetation of to-day, grows in the ashes of a thousand aspirations and a thousand failures. . . . . The great question with our agricultural journals is, whether it is to be a narrow, class affair, or whether it will comprehend and understand the entire world of legitimate and illegitimate industry it is called to support? Is our coming agriculture to know—to use the rough but expressive speech of Carlyle—who and what is it that is dancing jigs upon its belly? It is a very curious circumstance that our wisest politicians, our greatest theologians, our most eminent men of science, our acutest financiers, business men and politest society, do not succeed in keeping the nation from scrapes and pinches that nothing but a draft on the farm, in some shape, will help it out of.

By your books and newspapers shall we know you, and know how your money goes when you get any.

Let the farmer be well informed upon every subject. It is a disgrace to his newspaper that he should be continually cheated by traveling quacks of a bogus scientific, religious, medical or financial character.

Pure agriculture, like pure pork and molasses, may be a little too rich for some digestions, while a mixture, a seasoning like, might be quite acceptable.

I once knew a hen that had a trick of cackling when she hadn't laid any egg. All her force went to cackle and she set all the rest of the fowls at it. We didn't continue the experiment long enough to determine the results with absolute scientific accuracy. We couldn't afford to. Farmers never can afford to let any blamed foolishness go on—they always lose by it in the end. Our hen-yard, in cackling-time, became such a theater and circus of make-believe action, with running around and crowing, and flapping of wings, so out of all proportion to the business done there, that we sent the old hen to pot.

Publishers sometimes aver that farmers in general are as close to deal with as the bark of a tree, which is not uncomplimentary or unnatural, considering how they get what they have from the ground as slowly as the roots and bark of trees and plants do, and how many stones they have to turn, sometimes, to find a dollar, and how their risks are always long risks with nothing like what a trader would consider the chance of an adequate profit at the end

---

In the warm spell following a cold snap in Winter (to conclude our quotations from Mr. Olcott's address), farm cattle will kick up their heels most innocently, and shrewd managers will provide suitable occasions for the recreation. So the masses of our people—leaders and all—in the joy of prosperity after hard times, may be led into extravagances, unless a better judgment provides a reasonable vent or restraint, in view of the harder times and colder weather possibly in store for us.

EXPERIMENTS IN PIG FEEDING.—From the advance sheets of the Second Biennial Report of the Kansas State Board of Agriculture 1879–80, we are permitted, through the kindness of our contributor, Prof. E. M. Shelton of the Kansas State Ag'r'l. College, to make extracts from the report on his very interesting experiments in pig feeding. The Western plan of feeding has often been condemned on sentimental grounds, so, to arrive at some facts bearing on this question, the following experiment in feeding was undertaken. In this experiment ten pigs were employed, all pure-bred Berkshires of good pedigree. The experiment was begun November 1, 1880, and ended January 16, 1881—a period of eleven weeks. The ages of the pigs employed were:

Pen No. 1	Farrowed April 12, 1879
Pen No. 5	" " "
Pen No. 7	" " "
Pen No. 2	" July 4, "
Pen No. 3	" " "
Pen No. 4	" " "
Pen No. 6	" " "
Pen No. 8	" " "
Pen No. 9	" " "
Pen No. 10	" March 20

The three dates represent three different litters.

During the Summer preceding, and up to the time the experiment began, all the pigs were kept in a large pasture field—mostly prairie grass, but containing a small proportion of Orchard Grass and Alfalfa—receiving an ear of corn, per pig, each day. The pigs, as will be seen by the tables of weights given below, were a remarkably uniform lot, and of very excellent quality.

The pens numbering 1 to 5, inclusive, were arranged in the basement of a warm stone barn, and pens 6 to 10, inclusive, in an open yard on the south side of a close board fence, five feet high, but without other protection, except straw "nests," which were furnished both sets as needed. A single pig occupied each pen, an arrangement necessary to the proper apportionment of feed, and distribution of the results of the experiment.

In pens 1, 2, 5, 6, 7 and 10 shelled corn exclusively was fed; in pens 3, 4, 8 and 9 a ration of bran, in addition to the corn, was fed, the amount varying but little from two pounds per day. In all of the pens all the corn that the animals would eat was fed, great care being taken that none was left over in the troughs and wasted, or, on the other hand, that the animals were insufficiently supplied. The pigs were fed twice daily, at 8 A. M. and at 4 P. M., the feed being weighed out accurately to each pig at every feeding. If at the time of feeding the previous feed had not been consumed, the surplus was removed, and a proportionate reduction made in the amount of the next feed. All of the pigs received whatever water they required.

The bran was fed dry or mixed with water, to suit the tastes of the different pigs. At first this was eaten with apparent relish, but as the pigs increased in ripeness they seemed to care less for the bran, finally refusing it altogether, when, about the eighth and ninth weeks, the bran ration was discontinued.

All the pigs were weighed at the close of each week, a little before the time of the first feeding of the week following. In the table below is shown in pounds and decimals of a pound the weight of each pig at the beginning of the experiment, the total gain, the total gain per cwt., and the average gain per cwt.

TABLE NO 1,

Showing the weight of each pig at the beginning of the experiment, and at the close of each week, the total gain, the total gain per cwt. of each pig, and of the two sets.

Week of Experiment										
Beginning of experiment	272	240	258	275	226	244	229	249	252	285
First	281	257	268	294	228	253	239	260	259	293
Second	296	296	296	306	251	268	246	269	278	312
Third	313	262	297	323	273	287	259	283	293	332

Total gain	163	164	166	164	156	157	137	123	117	124
Total gain per cwt	59 80	68 30	64 30	59 90	69 60	64 30	59 80	49 30	46 40	43 50
Average gain per cwt	63 90					54 20				

Pigs kept in pens in the barn. Pigs kept in open pens in yard.

The remarkable uniformity of this lot is strikingly shown by the "total gain" in both sets, in the table, but particularly in the case of the five pens in the barn, the difference between the greatest and least gain being only ten pounds. The following table shows the total increase in weight, the total amount of corn and bran consumed and also the amount for each 100 pounds live weight.

TABLE NO. 2.

		Total increase	Total corn consumed	Total bran consumed	Corn consumed for each 100 lbs. live wt.	Bran consumed for each 100 lbs. live wt.	Corn consumed for each 1 lb. of increase	Bran consumed for each 1 lb. of increase
Feed, corn	Pens, 1, 2 and 5 in the barn	483 00	2,487 50	———	22 03	———	5 15	———
	Pens, 6, 7, and 10 in open yard	418 00	2,291 00	———	21 64	———	5 48	———
Feed, corn and bran	Pens, 3 and 4 in the barn	330 00	1,589 00	232 00	21 09	4 13	4 81	0 70
	Pens 8 and 9 in open yard	240 00	1,386 50	200 00	19 82	4 14	5 77	0 83

It will be observed that the pigs fed "outside," besides giving much smaller returns for feed consumed, in all cases gave less "total gains," and much less "gain per cwt.," as shown in table No. 1, and consumed much less feed than those fed in the barn.

The total loss from feeding in the open yards was quite marked throughout, and the variation in individual cases was considerable. It was noticeable that the quietest animals, the best feeders of those fed "outside," endured the severe weather the best, and gave the largest returns for food consumed.

The importance of a ration of bran or other coarse feed in connection with corn, for fattening pigs, is frequently urged by writers, on theoretical grounds. It was chiefly to test this question that bran was used with corn in proportion as before detailed, in two of the pens of each of the two series. The value of bran fed in this experiment may be shown in a brief summary and comparison of the results obtained. In pens 1, 2, 5, 6, 7 and 10, in which corn exclusively was fed, 901½ pounds of increase cost 4 778 5 pounds of corn, and in pens 3, 4, 8 and 9, in which corn and bran were fed, 570 pounds of increase cost 2,975 pounds of corn and 432 pounds of bran. That is, 100 pounds of increase, in pens 1, 2 5, 6 7 and 10, cost 530.35 pounds of corn: 100 pounds of increase, in pens 3, 4, 8 and 9, cost 521 93 pounds of corn, and 75 78 pounds of bran. Or 8.42 pounds of corn had, in this experiment, a feeding value equal to that of 75 78 pounds of bran—a fact which seems to show that corn alone can be more profitably used for fattening hogs than a mixed feed consisting of corn and bran.

MR. PETER HENDERSON favors us with a printed copy of his essay read before the annual Meeting of the American Association of nurserymen, florists, and seedsmen, held at Dayton, Ohio, in June last. From it we make the following selections:

Mr. HENDERSON is inclined to believe that, whatever kind of horticultural product is grown, whether fruit, flowers, or vegetables, he that is nearest the market, other things being equal, has a decided advantage; so much so that, in most cases, a man had better pay $50 or even $100 per acre rent, if within one or two miles from the market of a large city, than to get land ten or twelve miles away for nothing.

THE past season Mr. Henderson's firm raised nearly half a million of cabbage and lettuce plants, which they sold at $5 per 1 000. They sowed the seed the first week in February, on one of their greenhouse benches, so thick that they stood twenty plants to the square inch; these they began to thin out, to prick in hot-beds, just as the first rough leaf appeared, placing 1 000 plants in a 3x6 sash. The handling of that quantity was a big job, but Mr. Henderson doubts if one plant in a thousand failed, owing, he thinks, to a plan used, in preparing the bed on the greenhouse bench for the seeds—a plan that is well worthy of imitation in preparing a bed for seeds that have to be transplanted, of any kind, whether outside or under glass. He used only two inches in depth of the "soil" for the seed-bed which was made up as follows: the first layer, of about an inch, was a good friable loam, run through a half-inch sieve. This was patted down with a spade and made perfectly level and moderately firm. On this was spread about one-fourth of an inch of sphagnum (moss from the swamps), which had been dried and run through a sieve nearly as fine as mosquito wire, so that it was of the condition of fine sawdust. On the top of the moss the ordinary soil was again strewn to a depth of about three-fourths of an inch. The bed being leveled, the seed was sown very thickly, and then pressed into the soil with a smooth board. On this the fine moss was again sifted, thick enough to cover the seed only. The bed was then freely watered with a fine rose, and in a week every seed, that had life in it, was a plant. When the seed of most plants germinate, where they are quickly sown, the stem strikes down into the soil, the roots forming a tap-root with few fibers, unless arrested by something. Here comes the value of the one-fourth of an inch of sifted moss, placed three-quarters of an inch from the top. As soon as the rootlets touch the moss, they ramify in all directions, so that when a bunch of seedlings is lifted up and pulled apart, there is a mass of rootlets, to which the moss more or less adheres, attached to each. To the practical gardener, the advantage of this is obvious: the tiny seedling has at once a mass of rootlets ready to work, which strike into the soil at once. The advantage of the moss covering of the seed is not so apparent in the matter of a free germinating seed, such as cabbage, as in many others, but in many families of plants it is of the greatest value. For example, Mr. Henderson last November, took two lots of 10,000 seeds of Centaurea candida (one of the Dusty Miller plants so much used for ribbon lines); both were sown on the same day, and exactly in the same manner, in boxes of soil two inches deep; but the one lot was covered with the sifted moss and the other with fine soil. From the moss-covered lot were got over 9,000 fine plants, while from that covered

by soil there were only about 3,000. The same results were shown in a large lot of seeds, of the now famous climbing plant, Ampelopsis, Veitchii, and in the finer varieties of clematis. The reason is plain: the thin layer of sifted moss never bakes or hardens, holding just the right degree of moisture, and has less tendency to generate damp or fungus than any other known substance.

Among beets, Mr. Henderson remarks we have the Egyptian, which matures at least five days before any other variety, except the Old Bassano, which was too light in color to suit; in cabbages, the Early Summer; and in cauliflower the Snowball; in celery the Golden Dwarf; and the next season is likely to develop a great improvement in the New White Walnut Celery, a stout, solid kind, having a rich walnut-like flavor, and graceful feather-like foliage. In lettuce, the Black-seeded Simpson and the White Summer Cabbage Lettuce now lead all the out-door varieties; in muskmelons, the Hackensack, of which many thousands of acres are grown for New York market, is almost exclusively planted. In peas, a great improvement is developed in the dwarf variety known as American Wonder, though for a general early crop the Improved Daniel O'Rourke is best. Potatoes vary so much in different localities that it is difficult to say which of the new sorts are most valued. We are very glad to see that Mr. Henderson finds that in the general trade more of Beauty of Hebron is planted than of any other of the new sorts. In radishes, the New Round Dark Red is now the main favorite, while next in order comes the "White-tipped Turnip." In spinach, the Savoy and the New Thick-leaved, are the best for general crop; though the Savoy should not be sown in Spring as it runs too quickly to seed. Though every year brings out new claimants for favor in tomatoes, it is Mr. H's conviction that we have not advanced one day in earliness (unless in such varieties as Key's Prolific and Little Gem, which are of poor quality,) in 25 years, although we have now many varieties somewhat improved in quality. Quite a number of our market gardeners are now getting to grow strawberries in conjunction with their vegetable crops, by following the pot layering system, by which a crop is obtained in less than a year from the time of planting. Mr. Henderson has grown for the past six or seven years, upwards of an acre of strawberries in this manner, alternating them with the vegetables.

The process may be described as follows: Just as soon as the fruit is gathered, the beds are well forked up, and the runners begin to grow rapidly, so that, in the vicinity of New York strong pot layers may be obtained by the 10th to the 15th of July. These, if then planted out, never fail (if properly cultivated and the runners kept pinched off,) to give a full crop by June of next year; not only a full crop, but finer fruit than is usually obtained by the other methods. The pots, which should not exceed 2½ inches in diameter, are filled with the soil in which the strawberries are growing, and "plunged" or sunk to the level of the surface; the strawberry layer is then laid on the pot, being held in its place with a small stone; the stone not only serves to keep the plant in its place so that its roots will strike into the soil of the pot, but it also serves to mark where the pot is; for, being sunk to the level of the surface, rains wash the soil around the pots, so that they could not well be seen unless marked by the stone. Any good workman, after a little experience, will layer 2,000 per day. In 10 or 12 days after the strawberry layers have been put down, the pots will be filled with roots; they are then cut from the parent plant, taken up, and placed close together, and shaded and watered for a few days before being planted out. If so treated, not one plant in a thousand need fail.

In Mr. Henderson's market gardening and greenhouse operations he cultivates largely nearly every known family of plants, and in his long experience he has yet to see a fruit, flower or vegetable crop, that was not benefited, and nearly in the same degree, by a judicious application of pure bone dust.

Profits of a Black Walnut Grove.—We find the following in the Chicago Tribune. The profits of the grove are greatly exaggerated, as will appear to the reader. Still we advise the planting of the Black-walnut.

San Antonio, Tex., June 3.—The smartest Texan, and in fact the smartest farmer, I have ever met, is old Sim Graves, who lives on a 1,000-acre farm west of Waxahatchie, in Central Texas. After Mr. Graves had shown me his cattle and cotton, he took me over to see his woods.

"Well, what of it?" I said, as he pointed to a ten-acre forest.

"What of it?" Why, them's Black-walnuts, sir. Ten acres of 'em. Planted 'em myself ten years ago. See, they're nine inches through. Good trees, eh?"

And sure enough there were ten acres of hand-planted black-walnut trees. They stood about twelve feet apart, 200 to the acre,—in all 2,000 trees.

"Well, how do you get your money back?" I asked.

"Black-walnuts are worth $2.50 a bushel, 'aint they? I'll get 400 bushels this year. That's $1,000. A hundred dollars an acre is good rent for land worth $15 an acre, ain't it?"

"Well, what else?" I inquired, growing interested.

"The trees" continued Mr. Graves, "are growing an inch a year. When they are twenty years old they will be nineteen inches through. A black-walnut tree nineteen inches through is worth $25. My 2,000 trees ten years from now will be worth $50,000. If I don't want to cut them all, I can cut half of them, and then raise a bushel of walnuts to the tree,—that is, get $2,500 a year for the crop. Two hundred and fifty dollars an acre is a fair rent for $15 land, ain't it?"

The more I examine into the possibilities and probabilities of ten acres of black-walnut trees, the more astounded I become. There is no crop on earth that will come within fifty miles of it. Calculate it any way you may, ten acres of black-walnut trees will pay $250 annually an acre for the first forty years. Ten acres of black-walnut trees fifty years old would be worth $100,000. There is no fruit that will pay $2.50 a bushel, the market price of black-walnuts. Ten acres of black-walnut trees, at any age, would always find a a market, like a marble quarry or cool wine. It could always be sold. Mr. Graves says he has never seen a time since his black-walnut forest was two years old when he couldn't have sold it for more than as many crops of wheat.

Now, any farmer who has ten acres of overflow land on the Illinois bottom can do just what this smart Texan has done. He can make it worth more than ten acres in the suburbs of Chicago inside of ten years. Any Chicago man can buy fifty acres of low, black prairie within fifty miles of Chicago at $25 an acre, plant it to Black-walnut, and make it pay him $15,000 a year. (!!)

The cheapest, best, easiest put up and strongest lightning conductor is copper wire, says a writer in the N. Y. Tribune. Get at a metal store a coil of the length required, and as large as, or larger than, common telegraph wire. Fasten one end over your chimney-top, run along the ridge and down the end of your house, fastening with common blind-staples driven into the wood. Be sure to have the lower end terminate in permanently moist earth or in a well, not a cemented cistern. Use no glass insulators, patent tips or other humbug nonsense, and you will have the cheapest and most perfect lightning conductor that can be made.

Female Farmers.—We see the following in the Vermont Watchman: France has agricultural schools for girls. One of the chief is near Rouen, which is said to have been begun with a capital of one franc by a sister of charity and two little discharged prisoner girls, and to be now worth $160,000. This establishment has three hundred girls from six to eighteen. The farm, entirely cultivated by them, is over four hundred acres in extent. Twenty-five sisters form the staff of teachers. More than one medal of the French Agricultural Society has been awarded to this establishment at Darnetel, and the pupils are in great demand all over Normandy on account of their skill. They go out as stewards, gradeners, farm managers, dairy women and laundresses. Each girl has, on leaving, an outfit and a small sum of money, earned in spare hours. If they want a home they can always return to Darnetel, which they are taught to regard as home.

Sweet simplicity sometimes contains the sharpest sarcasm. A lawyer said to his client, an honest farmer, "Did you go to your opponent and try to settle with him?" "I did, Your Honor," was the reply. "And what did he say?" "Why, sir, he told me to go to the devil." "And what did you do then, sir?" "Then I came straight to you."—N. Y. Herald. . . . . Men are naturally charitable, but they have a bad habit of feeling everywhere for the poor except in their pocket-books. . . . . The Chicago Tribune says a broad-tire wagon draws 25 per cent. lighter than a narrow one. . . . . Dr. Felix L. Oswald, writing against meat-eating, especially in hot weather, makes the eminently sensible suggestion that "hot-headed boys can be more effectually cured with cows' milk than with a cowhide."—N. Y. Tribune. . . . . An esteemed contemporary asks the following question: Is it true, as rumor asserts, that Messrs. Whitman and Burrell's cows were found by several visitors during last Winter "very poor, weak, and sore-footed;" and if so, to what extent was their feed of ensilage responsible? . . . . How are the cows of Winning Billerica Bailey? . . . . . Mr. Harris Lewis of the Central N. Y. Farmers' Club, says that the Rhode Island people who beat the world in johnnycake prefer white corn. Others prefer the yellow. . . . . Level culture, we are rather surprised to see was preferred by all. One member preferred hoeing away from rather than towards the drills or even hills.

Everywhere.

NOTES FROM SOUTHEASTERN MARYLAND.

We have often wondered whether any news from our little colony would be interesting to the general public; but during a year's stay here we have learned to like this portion of the South so well that we are anxious to give a pen picture of the place and its prospects to the readers of The Rural. First, as to its location: 60 miles south of Lewes in Delaware you stop at our station on the railroad, called, Girdle Tree Hill. "Hill," you infer, means an elevation, but in this country it is no distinguishing term, for there are no hills. Col. Mapes, one of the directors who personally superintended the building of the road, told us that in 30 miles there was a decline of only two and a-half feet. Snow Hill, eight miles North of us, is the county seat; Pocomoke, seven miles southwest, is a pleasant, lively town, connected by both river and rail with the shipping centers of the South. So you see, this is a very good location for Northern farmers who, like ourselves, are disposed to emigrate to other and newer parts of the country.

Then we raise here wheat, oats, corn, sweet and Irish potatoes, all sorts of vegetables for market, cane sufficient to furnish molasses for home consumption, and an unlimited quantity of fruit. Little, if any, rye is sown. The only crop we have seen or heard of, is a field of 16 acres sown by us last Fall, and this is very excellent, the stalks being six feet high and heavily headed. The wheat crop will scarcely average as well as that of last year, but oats are doing better. Last year we lost 16 acres on account of the drought, but this present crop promises well. Corn, however, is the principal product of this section. It is a common estimate of a farmer that he "makes" a certain amount of corn, and there is an exact number of hills that furnish what is called "a horse till." So far this season this crop promises well. The weather—one day moist, the next warm and bright—is just adapted to its growth, as it is to that of sorghum of which every farmer in our section has sufficient planted for home use. Whether buckwheat will prove a successful crop is still a matter of trial. Last year the heavy rains prevented us from sowing any, but this we trust will prove better, and we can try then for buckwheat cakes for the winter—a luxury which we were forced to dispense with last Winter, very little being for sale in the stores, and that at $4 per cwt.

But nature makes up to us for the loss of many Northern products in the lavish manner in which she throws fruit of all kinds into our mouths. Of course, everyone knows this is a great peach country; but no one who is not accustomed to it can fail to notice what quantities of smaller fruit grow wild here. We have bought all our strawberries for five cents a quart at first, and three cents for later berries. Now they are about over, and fine large Ox-heart cherries are plentiful at 90 cents a bushel. You will find gooseberries in all the farm gardens, and they are a full crop; but we see very few currants, and do not think them generally cultivated.

Raspberries do not grow wild here as at the North, but they take very kindly to our gardens. The running blackberry is everywhere. You could scarcely see any ditch banks in the time of its blossoming, and in a short time you can pick a bushel in "no time." There will be a large crop of whortleberries and they sell here readily at $1 a bushel. This is not "apple year" with us, yet we have a dozen trees well filled; last year there were so many dried, that you could buy them at retail all Winter for four cents per pound. This *is* the "peach year" with us, but in this climate wherever the thermometer remains for 24 hours below zero, it kills the buds. And if your memory is not at fault, it will need no reminder of the fact that last Winter that indicator did not stop at zero, but went down the very last stairs into the cellar. Within a circle of ten miles I know of only two orchards that will bear fruit. They stood in so sheltered a position that the fierce cold did not affect them. And then they are old orchards or rather the trees are the "old-fashioned seedlings" and they claim here that these "old-time" peaches are more hardy than the varieties we buy of the nurserymen at the present day. So much for a bit of news from our quiet settlement. All of this has been practical description of our surroundings; but there are many things beside these matter-of-fact ones, of which, had I space, I should like to write you—of the roads, without a hill or a stone, lying among woods fragrant with magnolia and honeysuckle, bright with sunshine and laurel, and musical with song of robin and mocking-bird; of the little hamlets into which they lead you, each with its little church and white-washed fences and out-buildings, its immense fields of corn or wheat smiling to the sun; of the bay on one side of us and old ocean on the other, vying each with the other as to the purity of their breezes which come as God's blessing, unseen but thankfully accepted in long Summer afternoons. Our twilights are shorter than at the North, but when the night settles down "starry and still," it is so full of beauty that you have not missed the "blind man's holiday" of your childhood hours. K. D. T.

Klej Grange Colony, Worcester Co., Md.

RURAL SPECIAL REPORTS.

Alabama.

Anniston, Calhoun Co., June 28.—Acreage in wheat 50 per cent. less than usual; yield very good. Oats 10 per cent. more than last year; will make three-fourths of crop. Very little rye and no barley. Wheat, Blue Straw. Oats, rust-proof and blue. We have had an excellent season so far for corn; about the same area was planted as last year, but it has been badly neglected for "King Cotton." There are many fields that have not as yet been touched, and the best part of the season is passed. More land has been planted in cotton than ever before, and where it has been properly worked it looks better than I have before seen it at this time of year. No peaches or blackberries. Raspberries and strawberries good. Fair crop apples. C. A. S.

Arizona.

San Pedro, Pima Co., June 23.—This section of Arizona has only been settled four or five years, and only small quantities of grain are raised. Wheat, oats and barley do well, but every crop is raised by irrigation. This is not considered to be a good corn country; very little is raised. Orchards are all young. My father has about 2,000 trees of all kinds; they were small yearlings and were set out two years last Spring. Peaches and plum trees are twelve feet high; other trees do well. We have some peaches this year. Grapes and strawberries do finely, but other small fruits are failures. F. L.

California.

Sacramento City, Sacramento Co., July 4.—Wheat and barley are the chief staples of this and Lassen counties, and of these there will be about half a crop as compared with last year's total yield, as the acreage is less. Very little rye or oats is grown here, and corn is raised only along the river bottoms. Small and orchard fruits are fully up to the average. S. S. H.

Canada.

Burford, Northfield Center, Ont., July 5.—Wheat yields about 14 bushels per acre, some pieces are good but others are quite thin. The usual average for years has been about 25 bushels—Clawson, Fultz and a little Scot. Barley and oat prospects good; rye very little sown. Peas are good. Corn outlook very poor; large quantities have been planted over, and even then have not grown. Last year's crop was not very good and it was not well cured on account of the rain, much of it failed to mature well and therefore the seed must have been poor. The supply of fruit will be small; a number of trees are dying, I think from the hard Winter. Greenings are suffering most with me. Peaches not much grown. Small fruits have also suffered. Black-cap raspberries and black currants will be scarce. Strawberries are not so plentiful as they have been some seasons, but are a fair sample. Grapes have also been much injured by the Winter, especially the more tender varieties. Cherries in all varieties are very scarce; hardly enough for the birds. The hay crop will be good. Clover not having been injured by the Winter, has more than a usually good outlook. Potatoes look very well; the Beauty of Hebron is making a large growth. The bugs are not quite so numerous, but there will be enough of them by the time for the late varieties. D. S.

Colorado.

Sedalia, Douglas Co., July 2.—An increased acreage of wheat; but the outlook now is discouraging—so dry. The same can be said of oats and rye; but little barley is grown. Corn looks well, but not much is grown in Colorado—nights too cold. All the orchards in this State can be counted on the fingers of one hand. All the apples raised in Colorado cost a dollar each. Small fruits are on the increase and promise well at present. Colorado is not a farming State. Mining and stock raising are the main industries. U. T. S.

Dakota Territory.

Utica, Yankton Co., June 28.—Our Winter here was the severest that I have ever experienced in my life and a greater depth of snow fell and stayed on the ground very late, causing the ground to be very wet when it went off. We usually get our small grains sowed by the first of April; this year we commenced sowing the last of that month, and then were hindered by a very wet May, consequently, our

crops of all kinds are late and backward, and our acreage is a good deal less than usual. A large area of the Missouri River Valley was badly flooded and is covered with sand deposits, mud and stagnant water yet, and will remain unseeded this year; while a good deal of our up-lands, owing to the melted snow and excessive rainfall, are covered with water and too muddy for cultivation. Wheat was sown late on account of failure for the past two years, not more than a third of the usual acreage was put in, flax being substituted for it. While here and there under peculiarly favorable circumstances there may be a good piece, the general average is poor—will not make over one-half or one-third of a crop. Corn was planted late in May and, on account of the wet weather, most of it rotted and the ground either remains without a crop or was replanted to corn in June, which will make it a matter of difficulty for the late-planted to get ripe. An unusually small acreage was planted. Oats were sowed late; about the usual acreage; a fair outlook for a good crop. Potatoes look tolerably well. We have the usual number of bugs. A large acreage of flax has been sowed, but it is very late—farmers have just quit sowing; looks very well so far; but it is almost too soon to tell what it will do. Hay is a good crop on the up-lands. Gardens are pretty good where properly tended. So far we are free from insect pests, with the exception of potato bugs. On account of the failure of our two principal crops, wheat and corn, and the small amount sown, our prospects are not particularly promising. G. W.

FLANDRAU, Moody Co., July 1.—We estimate the area under cultivation in this county at about 75,000 acres, of which 65 per cent. is in wheat; 15 per cent. in oats; 10 per cent., in barley and 10 per cent. in corn, flax, truck, etc. The principal varieties of wheat are Lost Nation and Fife; a larger proportion of Lost Nation was sown this year, as it yields from five to seven bushels more per acre. Only sufficient corn is raised for home consumption. Very little rye is raised but it does well. As the country has only been settled three years there are not many orchards. Small fruits on my place are doing nicely—so well that I am encouraged to plant largely. We have had a great deal of wet weather, but our rolling prairie resists drought and wet equally well. Crops are looking splendid and the prospects are better than in any season since I have been here. W. R.

Florida.

MANATEE, Manatee Co., July 3—The weather is delightful, very warm; the thermometer registering from 80 to 96 degrees, in the shade at noon; but at the same time we have a refreshing breeze. The nights are very comfortable. It has been very dry with only an occasional shower. No wheat, oats, rye or barley raised hereabouts. Corn is raised to some extent—just enough for home use; it is not considered a paying crop. Vegetable raising seems to be the coming industry. Farmers commenced shipping in January. Fruit is looking well, as there was no frost in this section last Winter. Strawberries have been in bearing since February. Grapes are doing well, the Hartford Prolific is now ripe. Our great need is quick transportation. B. F. C.

Idaho.

MOUNTAIN HOME, Altura Co., June 24.—There are not more than 500 acres of grain in this whole county; and oats and barley take up the most of this area. Wheat grows well but none is sown. Corn is a failure—none planted. The acreage under grain has been about the same for the last few years. Most kinds of fruit thrive here, but very few trees have been planted. Idaho as a farming State is a failure—not one acre in fifty thousand is suitable for cultivation. G. B. R.

Illinois.

ROCK FALLS, Whiteside Co., July 1.—Here field crops are poor, except potatoes. The drought in May was very disastrous to wheat, oats and barley, and rye was badly winter-killed. The frost and snow prevented sowing the usual amount of Spring grain in season; consequently there was a large acreage of corn planted on all farms which were not too low and wet. But there is great complaint of poor seed, and the incessant rains keep the low ground under water, and prevent replanting and working the rest. Where the land was in good condition and there is a good stand, the corn looks as well as is usual for the season. Orchards were injured by the severe Winter, and many apple trees have been killed and very few varieties have any fruit. There are no cherries; very few pears, but plums promise well. I think there will be a fair crop of Concord grapes, although many vines were killed and all greatly injured by the severe Winter. Raspberries look as well as usual; both black and red. Blackberries are a total failure where they were not protected. Snyder and Taylor Prolific were equally injured on my grounds and will only have a few scattering berries. Strawberries produced enormous crops. Each variety seemed to surpass the others in productiveness. Wilson and Monarch were the poorest growers and it is almost impossible to get the ground covered and they are easily injured by drought, weeds, grubs, etc., which other vines withstand. Chas. Downing, Downer's Prolific, Miner's Prolific and Glendale will be largely planted in this vicinity for market, but the Crescent, when fully developed, is with us the finest table berry and the greatest producer. G. W.

QUINCY, Adams Co., July 2.—Wheat where protected by timber and by snow during Winter is good, but on the north and west sides of bluff land, where the snow was blown off, the roots were winter-killed. Crop will not be more than a half—Clawson and Fultz. Oats promise well; an increased acreage owing to failure of wheat. Corn, so far, promises well; much will depend on the weather at earing time; acreage will be more than last year, also owing to failure in wheat. Hay will be a good crop; straw a short one. No peaches. Apples about one-fourth of a crop. This is the "off" year and, owing to the trees bearing heavily and not having been thinned last year, they seem affected by the hard Winter and the fruit is dropping off badly. Cherries very light—scarcely any. Currants and gooseberries rather light. Raspberries a good crop, Blackberries, Snyder, a large crop; other kinds were winter-killed. Grapes will be about half a crop. A. G.

Iowa.

LEROY, Bremer Co., June 24.—Wheat and barley but little sown; look well now, but chinch bugs will probably take much of the wheat before harvest—Lost Nation, Scotch Fife and some Tea Wheat. Oats and corn are the principal crops; acreage larger than last year, and a better prospect for good crops. Considerable flax has been put in this Spring. Apples not as many as last year. The Ben Davis trees look sick; the Duchess of Oldenburg are all right, and promise a good crop; so does the Wealthy. Grapes not as plentiful as last year—vines injured by the cold. Small fruits promise good crops. Grass extra-good. Butter, hogs and cattle are our principal products. E. E. F.

Kansas.

RENO, Leavenworth Co., June 31.—The most terrible and disastrous rain and hail storm ever known here swept over this county at two o'clock on the morning of June 25. Almost half of the wheat crop was harvested. What was not cut now lies flat on the ground and never can be cut. Corn, sorghum, potatoes, fruit, and all gardens were utterly destroyed. An immense amount of glass was broken and ruin is now visible on all sides. The rainfall was tremendous—probably five to six inches on the level. J. W. MC C.

Mississippi.

COOPWOOD, Winston Co., Miss.—No wheat was sown in my neighborhood this year. It rusts so badly there has been but very little sown for eight or ten years. The oat crop was very good, better than last year. The red rust-proof are preferred by everybody here; they make more to the acre and never rust. No barley or rye is raised, though rye does well. Corn does not look well; the acreage is smaller than last year. Apples and pears do well; so do peaches in some localities. Plums do finely, and some grapes exceedingly well; others rot. Raspberries and strawberries do excellently. Blackberries are on almost every hill, and always between them. No fruit is raised here for market. We are expecting a railroad to run through our county soon, and I hope it may change the condition of things—we are far in the back-ground here. J. E. W.

Montana Territory.

MILK RANCH, Missoula Co., June 29.—This is a way station on the Mullan road, and very little grain is raised in this section owing to the fact of its being too far from a market. Settlers are at present from four to twelve miles apart, and there is plenty of unsettled land. Oats are the principal grain raised here and fed to stock. No corn has yet been tried, but doubtless it would do well in some places. Fruits are also strangers. J. V.

New York.

HIMRODS, Yates Co., July 5.—We are having some very hot weather at present and are in need of some rain. Wheat is growing very slowly and will fall short of a full crop. Haying will be quickly done, as it is light and scarce. Some meadows are very good a few miles away from here. Oats and barley look good. Corn had a bad start; we cannot expect more than one-half to two-thirds of a crop—crows, cut-worms and wet, cold weather damaged it. Some had to plant three times; others plowed it up and have used the ground for a late crop. G. A. B.

Ohio.

CAMDEN, Preble Co., July 2.—Wheat about all cut, and I think it fully one-fourth short of an average crop. Oats very short, but will be long enough to bind. Meadows light. Corn looking well, but very small for the first of July. There will be a light crop of apples; no peaches; no blackberries; a few cherries and raspberries. My German carp are doing first-rate. My Rural Branching Sorghum—you ought to see it spreading itself. The White Elephant is doing well; so is the asparagus. Blount's Corn is as high as my head—five feet, ten inches. W. M.

Oregon.

JUNCTION CITY, Lane Co., June 20.—The crop in this valley is almost entirely wheat; that is the only crop that will bear shipping to foreign markets. We can raise good oats, rye, or barley; but if we had more than we need for home use, it would be slow sale. As for corn, it does not do well in this part of Oregon; the climate is not warm enough; it ears well, but remains green until the frosts of Winter kill it. I have not seen any ripe corn since I came to Oregon seven years ago. If we want corn meal we are obliged to kiln-dry our corn before grinding. The outlook for wheat is perhaps a little above an average, but the acreage is not as large as last year. The rust of two years ago, and the low price of wheat this year, caused many farmers to summer-fallow portions of their lands, expecting larger crops and better prices by next year. A number of varieties of wheat are sown here; Chili Club and Big Club are the kinds mostly sown in this part of the valley; they are both white wheats. The fruit crop in this locality will not be an average. Apples will be a fair crop; pears below an average, and plums about half a crop. No peaches; this is not a peach country. Smaller fruits are very light crops—too warm and dry in early Spring. W. J. D.

Washington Territory.

VANCOUVER, Clarke Co.—The climate is temperate; the Winters are not extremely cold and the Summers not very hot. During the hottest season of the year the nights are always cool enough to make a blanket desirable. The rains last five or six months in each year, but are not continual and always are gentle and the settlers learn to look upon them as a "god-send." The average "Webfoot" has a distaste for drought. In 11 years' residence I have not seen any seriously droughty weather yet—sometimes two or three months without any rain during the dry season. Wood, water and game are in abundance. In opening up land in this section much labor is involved in clearing off the timber. All cereals grow well except corn, which is not a success. Apples, plums, cherries, pears, etc., are finer than I ever saw anywhere else. Peaches cannot be grown successfully except in a few sheltered and favorable spots. Land here sells from $5 to $50 per acre, according to location and improvements. A pretty good farm of 160 acres, half in timber and half under cultivation, can be bought for about $2,000. J. J. B.

WALLA WALLA, Walla Walla Co., June 29.—Eastern Oregon and Western Washington Territory will ship this year 150,000 bushels of wheat down the Columbia River. The wheat crop now looks in first-rate condition. Oats, barley and rye are grown only for home use, and amount to only about one-third of the wheat acreage. Very little corn is raised, as the climate is not adapted to it. All kinds of orchard and small fruits as well as vegetables are in abundance. J. F. W.

CEDAR CREEK, Whitman Co., July 2.—The area under grain in this neighborhood is about 6,000 acres, and this is one-fourth more than last year. The outlook for wheat is good—China Club, Little Club, White Winter, Velvet Chaff and Red Chaff. Oats, too, are fine—Cayuga, Surprise and white and black. A splendid prospect for small fruits; but the country has not been settled long enough for the growth of orchards to bearing condition. All young orchards, however, are vigorous and thrifty. J. L. D.

STEAMING WITH HOSE.—FIG. 340

The Querist.

ANSWERS TO CORRESPONDENTS.

Nasal Catarrh.

J. O. B. Afton, N. Y., has a cow which has much trouble in breathing through the nostrils which are swollen or partly closed, and somewhat sore and inflamed, and from which there is a yellowish discharge of a mucous nature. The animal eats well and is otherwise in good condition apparently.

ANS.—The trouble is due to nasal catarrh, which is chiefly caused by sudden alterations

STEAMING WITH NOSE BAG.—FIG. 341.

of temperature, bad ventilation, deficient drainage and exposure to cold in unsheltered situations. The earliest symptoms are a dryness and a redness of the membranes of the eyes and nose; but these soon become moist and discharge a thin, watery secretion, which later on becomes dense, opaque and copious. Sneezing, cough and a feverish condition follow, and diarrhœa, also, sometimes occurs. If the disease continues and the causes are not removed the outcome may be nasal gleet, malignant catarrh, or sporadic pleuro-pneumonia. If diarrhœa is present, administer the following:—Infusion of quassia, one pint; tincture of opium, one ounce; aromatic spirits of ammonia, one ounce—mix. When the bowels are constipated administer the following gentle laxative:—Epsom salts, 12 to 16 ounces; ginger and gentian, powdered, of each one ounce—mix, and give in a quart of ale. The feed should consist of bran mashes, roots and green food. Steaming is of great benefit in this disease and may be readily performed in either way, here illustrated. In one case a hot, steaming, bran mash, to which a quantity of turpentine or vinegar may be added, is put into a nose bag which is fastened as shown at Fig. 341. In the other case an India-rubber tube is attached to the spout of a tea-kettle placed over a fire, and through it the steam generated is conveyed to the nostrils—see Fig. 340. Both of these methods should be continued several hours. Where the steam jet is used, care must, of course, be taken to avoid too much heat which would scald the parts.

A. M. Stone Church, Ill., asks whether locusts will hurt apples and if it is safe to eat the apples on which they have been.

ANS.—Assuming that the 17-year locusts are meant, they have never been reported as injuring fruit. They take but little nourishment in the adult state, and that little they derive from twigs which they pierce with their beaks and from which they suck the sap. The principal damage for which they are responsible is the injury to the twigs in which their eggs are layed.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JULY 9.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, JULY 16 1881.

OUR picture of Iroqnois published last week was re-engraved from the original which appeared in a late number of the Illnstrated London News.

THE RURAL is not a Republican—neither is it a Democrat. It takes no part in politics and politicians. But we do sincerely rejoice that hopes may be entertained of President Garfield's recovery.

FRIENDS OF THE RURAL, we give timely notice. Reserve one-twentieth of an acre at least of your best land for our next Free Seed and Plant Distribution. Besides the interest which attaches to testing novelties presumably good, we are in hopes to render our next Distribntion peculiarly attractive. Hence the above notice.

As we go to press a specimen of a new variety of oats is brought us from the RURAL FARM, which is, as yet, unnamed. It consists of one root and five stems; the stems, or stalks, averaging five feet and five inches in hight, and fully one-fourth of an inch in diameter np to three feet in hight. The leaves average three-fourths of an inch in width. There are 90 spikelets on a stem, or in one panicle.

THOSE COMPETING for the Rural Wheat Prizes for the largest and heaviest heads will please send five heads of each variety. It is best to pack them in suitable paper boxes of any kind and send by mail. The postage is but one cent per ounce, if the box is not *sealed*. Our friends will not forget to write on each box their full name and address, otherwise we cannot place the wheat sent with the name of the sender.

SUCH NOTES as the following are very gratifying to the RURAL.

PRUDENCE ISLAND, R. I., July 8, '81.
Please accept my thanks for the gift of a root-cutter, received this day. What with choice seeds, big mangels, the gift of a machine to cut them with, and, above all, good advice, I cannot but regard my subscription to the RURAL as my best investment. Respectfully,
E. FARNHAM.

HERE IS A CHANCE for the thousand and one tramps who complain that they can find nothing to do! The Denver and Rio Grande Railroad Company has advertised in Great Britain for ten thousand laborers, to whom a two years' contract is offered on their presenting themselves at the Company's office. It is a pity that workmen cannot be found in this country, especially in these days when hordes of able-bodied men with nothing to do are arriving daily at our ports. One week's accession of immigrants could be disposed of to good advantage out there where labor is in snch great demand, and a few car-loads of country tramps would serve quite as good a purpose there as they do here in the East. lying under fences or begging from door to door.

THE TELEPHONE PEA.—This, as our older readers will remember, was dissemina ted by the RURAL NEW-YORKER in its distribution of 1879. As grown at the Rural Farm the present season, it is the most valuable pea we have ever raised. The stems are so strong that although they grow to the hight of four feet, little support is necessary. The vines are marvels of productiveness and luxuriance the pods very large and well-filled,—peas of the first quality. Sown at the same time with McLean's Advancer and Extra Early Alpha, they are ready to pick nearly at the same time, being but two or three days later. Except where extreme earliness is an important item, we commend the Telephone to our readers as among the very best peas in cultivation.

THE COMET, of which we spoke editorially last week, seems determined that the events of the terrestial sphere shall not attract unto themselves all the attention, so last Wednesday night it blew up, it was said by prominent astronomers, and two distinct comets were formed. But it had a precedent for so doing. It wasn't at all original. People say there's nothing original nowadays, but original sin. Biela's comet did the same thing in 1845, when two distinct bodies with coma, nucleus and tail were formed, and side by side, in brotherly companionship they traveled, with singular interchange of luster, and in 1852 they were again both visible in the same field of view. Now the astronomers will have the pleasure of determining the nature of new orbits, for the parts separated with such swiftness that their motion was visible 35,000,000 miles away. We hope this beautiful theory will not be overthrown by the discovery of a spider's web across the object glass of some sleepy astronomer's telescope.

THE RURAL BRANCHING SORGHUM.

WE find that not over 15 per cent. of the Rural Branching Sorghum seed has germinated. This is, no doubt, owing to its inferior quality. Our friends will not reproach us, however, since our entire crop in South Carolina very nearly proved a failure, and we deem ourselves fortunate in having procured enough seed, though indeed of poor qnality, to supply all applications. This will at least enable all to try it and test its value. The claim has been made by several of our California readers that they have this Branching Sorghum and they have sent us fair, plump seed, thrice the size of that we sent out, to try. We have sown the several samples which germinated freely and the plants are now far in advance of those from our own seeds. While we have doubts that they may prove the same, it is to be hoped they will, for an abundant supply of seeds of the best quality would thus be fully assured.

A GREAT DELIVERANCE.

As we went to press last week, this city was saddened by the intelligence that the wretch Guiteau had accomplished his nefarious object, the President having just died. The news agitated the crowds that all the day long congregated before the bulletin boards of the newspaper offices, and spread sorrow through the city as the yelling young hawkers of "extras" of the evening papers bore it far and wide. Ont of a heart full of grief and indignation we spoke a few fitting words in announcing the calamity to our readers. Providence, however, has been merciful to the country and to the family of the sufferer in preserving the former from the horror and shame of a second presidential assassination, and the latter from the loss of its honored head. The President still lives and has been improving steadily in health ever since the favorable turn of the crisis a few hours after the news of his death had been wired from Washington. All present indications point to his assured recovery, and althongh his doctors still hesitate officially to proclaim him out of danger, it is evident from the tone of this morning's telegrams that a sense of the grave responsibility of an official declaration of the fact alone witholds them, for a brief space, from gladdening the nation with the announcement.

Political assassination has always been the resort of heavily oppressed nationalities debarred from an outspoken expression of their grievances. It has never been characteristic of any part of the Anglo-Saxon race, and, least of all, of that branch of it which has flourished so vigorously and freely on this continent. The first crime of the kind among us was the work of a madman with a hereditary taint of insanity; the late attempt was the outcome of a low grovelling, semi-insane, vain, vagabond life on the part of the would-be assassin. The crime was utterly un-American.

CROPS AND MARKETS.

ACCORDING to yesterday's cablegrams the Italian Minister of Agriculture had just reported that the weather throughout the country had been very favorable to all growing crops, except that some local damage had lately been done by hail-storms. In the central and northern provinces the harvest is expected to be abnndant; that in the Southern provinces less so. Recent rains had greatly benefited maize which is in excellent condition. Vines and olives are heavily laden, forage promising; but fruits and hemp leave much to be desired. In France crops are reported fine in the central provinces—the great wheat-growing region, while this season's vintage will be the best for the last fifteen years. From Spain crop reports are contradictory; favorable reports, however, considerably predominate. In the United Kingdom the recent favorable weather has improved the outlook, bnt there is still mnch donbt of snch crops as were common before the late era of agricultural disaster. Even with an average yield per acre, however, the aggregate yield must be less than formerly owing to the smaller area nnder wheat. Cablegrams from St. Petersburg announce that the crops will be good throughout the Empire, and extra good in the southern provinces. In Germany crops are fair on the whole; but reports yet are more meager from that broad country than from any of the other prominent prodncing nations.

With regard to the wheat crop of this country we see no reason to make any noteworthy alteration in our estimate of the aggregate yield as abont 20 per cent. or 97,000,000 bushels less than last year's total crop. True, nearly all the chief newspapers East and West still persist in maintaining that the crop of 1881 will fall little, if at all, behind that of '80, but all trustworthy reports in other agricultural papers, as well as those by various State Boards of Agriculture favor our opinion. Secretary Chamberlain, of Ohio, correcting an error in our last issue, into which we were led by a contemporary, usually very reliable, estimates the yield in Ohio at 77 per cent. of last year's, and says that, according to official and private sources of information, the prospects for the crop in Michigan, Indiana, Illinois and Iowa promise only 50 per cent. of last year's totals. The demand for wheat in Europe is certain to be considerably less this year than last; but our exportable surplus is also sure to be considerably less, and the prospect is that, after harvest, prices will probably be as good as last year, and that it will be highly unwise for those who can afford to hold their wheat, to rush the new crop to market, unless they obtain satisfactorily remunerative prices for it.

COTTON SEED PRODUCTS.

Of all the agricultural products of the South, it is doubtful whether any has been so much wasted or misused as cotton seed until of late, and even now, taking the whole country, probably more of it is used to little effect than to the best advantage. At the late Cotton Crushers' Convention at Cincinnati, a Louisiana planter stated that he had found cotton-seed meal scarcely inferior to guano as a fertilizer, while an Alabama planter claimed that by its use he had increased the production of a given area of poor land from 18 to 145 bales of cotton, and a Connecticut farmer declared that it was the best fertilizer he had ever nsed for tobacco lands, tripling their productive capacity in three years. As a cattle food its merits received the strongest sort of indorsement and are yearly growing in pnblic appreciation at home; abroad it has long been held in high estimation in Great Britain, Sweden, Norway and several other European conntries. The European demand for cotton-seed oil, too, is growing rapidly. Until of late years, this oil had entered into our trade with Europe only in small qnantities, and was used chiefly in the manufacture of coarse soaps. About half a dozen years ago, however, manufacturers sncceed in so improving the quality of the article that even experts could hardly distinguish it from olive oil, with which it seems to have so close an affinity that when both are mixed the adulteration can with difficulty be detected by the most skillful. At once the exportation of this snperior oil increased so rapidly, especially to Italy, that it excited no small surprise until it was discovered that it was largely used for the purpose of adulterating the much higher-priced olive oil produced in the Italian and Spanish Peninsnlas, but particnlarly in the former. So difficult did detection of the adulteration prove there that, to assure their customers, some of the largest houses in the oil trade had to guarantee the purity of their brands on the ground that they bought directly from the peasants. The government inspectors indorsed their statements, yet it was afterwards proved that these very oils have been adulterated by the peasants who had themselves bought cotton-seed oil to mix with them before selling them to the wholesale dealers. Instead of attempting the difficult task of punishing the guilty, the government lately increased the duty on imported cotton-seed oil from $1.15 to $3.86 per quintal and placed a tax of $1.70 per quintal on that made in the country. For a time this excessive import duty will doubtless somewhat injure our trade in this product; but hitherto the high price of olive oil has almost entirely debarred the lower classes from its use—a severe deprivation throughout Southern Europe where oil is an important article of food—and now that they know that cotton-seed oil is as healthful and resembles the more expensive sort so closely in all respects, they are sure to use it extensively should the governments of Italy, France and Spain not place a prohibitive import duty on it. Already Consul Gonld of Marseilles reports that most of the cotton seed oil imported into that city is used by the population in its pure state with the full knowledge of the consumers, who prefer to nse it at a reasonable price than to pay a mnch higher figure for olive oil which they cannot distingnish from it.

BREVITIES.

THE Bidwell Strawberry, this year, has continued in fruit thirty-one days, beginning the first of June.

NOT an Army-worm has been seen at the Rural Farm this Summer. This is in accord with the RURAL'S prediction that sections last year infested would not again be infested this year.

A BRANCH of the Highland Beauty apple, ten inches long, sent to us by Mr. E P. Roe, bears 100 apples. In their present green condition they measure from one to one-and-a-quarter inch in diameter.

THE RURAL requests that any of its readers who have a head of the so-called "Golden Grains," will send it to the Editor by mail. We believe this to be the Black-bearded Centennial and have so expressed ourselves in these columns more than once. But the RURAL does not tolerate injustice and desires to confirm its opinion or retract it.

THE Atlanta Cotton Exposition is to open on October 5, and close on December 31. Director General H. I. Kimball says that, as no charge will be made, to exhibitors, for floor-room, every merchant, mechanic or manufacturer in the civilized world can now enter his wares for exhibition by sending a formal application and a check for the entrance fee—$25.

GEN. HARDING, speaking for Tennessee, considered Hungarian Grass to be the best forerunner of Timothy. He recommends that this be sown in Summer and harvested in August or early September, and that Timothy be sown upon the stubble and harrowed in. The Hungarian Grass, he thinks, destroys all weeds and gives a certain compactness to the soil, necessary to secure a good stand of Timothy.

IT would appear that this season's crop of strawberries has been the greatest ever raised in this country. And yet, as a rule, they have sold for good prices. Large berries of a bright color have always readily sold at from 25 to 30 cents per quart basket. At the fancy fruit stores of Broadway extra sized berries brought from 40 to 60 cents, and, strange to say, most of them were Great American. There is no doubt that this variety, however it may fail here, there and almost everywhere, succeeds admirably in *some* places.

THERE have been on exhibition at the rooms of the Decorative Art Society, in this city, some pieces of needle-work, which, when suspended against the wall, resemble water-color paintings, and one viewing them at a distance might pronounce them as such. Our lady friends can, doubtless, appreciate the wonderful skill displayed in selecting, blending and working the various hues of the material used in order to produce such interesting effects. What the artist does with the brush has been well imitated by Mrs. O. W. Holmes, Jr., who has some twenty pieces of needle painting on exhibition, representing various Winter and Summer scenes. This is, indeed, the sublimation of embroidery, and something which our good grandmothers of forty years ago would have classed with the things impossible.

THE Cincinnati Price Current, June 30, stated that the Secretary of the Ohio State Board of Agriculture estimated the wheat crop of this year for that State at 6,000,000 more than last year's total crop. From a condensation of the official report made on July 7, given in our Agricultural News Department, it appears that this statement was erroneous, inasmuch as the aggregate wheat yield this year is estimated at 12,000,000 bushels less than last year's yield, instead of 6,000,000 bushels more. This estimate approximates correctness all the more closely in that it has been made after nearly the entire crop had been secured in good order. Our estimate of the wheat crop of the country put it twenty per cent. less than last year's crop; Ohio's appears to be twenty-three per cent. less by the present estimate. Some other large wheat-producing State, however, will doubtless make up for this slight difference.

AMONG the crop reports lately received was one from Pennsylvania of which the following is an extract:—"Wheat acreage about a quarter less than usual owing to the early setting in of Winter which prevented Fall sowing. Fully half the crop was entirely winter-killed, plowed up, and the ground devoted to other crops, mostly corn. More than a tenth was destroyed by the drought in May and about a fifth by several very severe storms that have visited this section. The chinch bugs and other insect pests have taken a good deal of it—probably an eighth, and even with favorable weather till harvest there cannot be one half an average crop." A little figuring will show that, according to the above account, one-fifth more of the crop was destroyed, in one way or another, than grew, on an average, so that it is hard to see how it could produce even half an average crop, after a deficiency of one-fourth of the area of an average crop, and the destruction of thirty-seven fortieths of the yield on the remainder in various ways.

Miscellaneous.

RURAL BRIEFLETS.

Cut Hungarian Grass as soon as it is fairly headed out.....

Sow buckwheat—generally three bushels to the acre.....

Garden ground may be cleared of early peas, spinach and potatoes, and swedes be sown. Sow in drills three feet apart.....

Plant beans for pickles. Some of the stringless Golden Wax Beans are excellent for pickles, though Refugee is generally planted for that purpose.....

The Green Flageolet, a new variety, we should think would prove valuable for pickles since even after cooking or when quite ripe they retain the green color.....

We have this season for the first tried Swiss Chard for greens and find them in tenderness better than other beets sown for this purpose.....

The last planting of sweet corn may now be made. Such early kinds as Early Minnesota, Moore's Early Concord or Early Narragansett should be selected for this climate.....

As soon as the gladiolus shows the flowering stalk it is best to provide light supports. Very thin, light sticks suffice. When the bulbs or corms are planted deep, support is scarcely needed except in case of high winds.....

The Japan lilies should also be supported before they bloom.....

Move the vines of sweet potatoes frequently.....

Sift upon the young squash, melon and cucumber vines fine (sifted) coal ashes mixed with a little hellebore, aloes or snuff.....

Train and tie to the poles Lima beans when necessary. Pinch the ends when the vines are four or five feet high.....

Attend to the cions of grafted trees. When growing too freely, support them by tying to other branches.....

Pinch out the growing shoots of raspberries and blackberries.....

See that the cattle and farm stock in general have fresh water and plenty of it. Trite advice? But hundreds of farmers do not heed it.....

Remove all garbage from the dwelling. Whenever a disagreeable odor is perceived, ascertain whence it comes. Pure air is one of the safest guards against sickness, as foul air is one of the most prolific causes of disease.....

Arbor-vitæ hedges may now be cut back.....

If confined in yards, give the poultry plenty of fresh grass and clover. Give them pounded shells, bone flour or slaked lime. Whitewash the houses and remove the droppings *frequently*. Kerosene the roosts—and, "don't you forget it."....

The aphis, or green fly, seems to be growing more and more abundant upon fruit trees from year to year. Cherry, pear and apple trees—young ones especially—have been so infested with them of late years that in many instances the leaves are entirely killed. The production of a new set weakens the tree, of course, and the young wood so made is generally killed by the following Winter. It is a troublesome insect to deal with and the only effectual remedies—tobacco water, snuff or whale-oil soap—require so long in their application as to render them impracticable. We have of late tried London-purple in water, applied with an old whisk broom, but although the twigs, stems and leaves were well sprinkled, the aphides were not appreciably lessened in number.....

Mr. J. B. Alcott says that, like a woman or man, the agricultural journal needs to be loved to do its best—which is very true. If we were not impressed that the Rural New-Yorker were all the while gaining in the affections of its readers, we should not care to continue its publication. We might continue it as a matter of business or profit—but not as a work of love.....

KINDLY WORDS APPRECIATIVE OF THE RURAL NEW-YORKER.

I find the Rural an excellent medium for advertising and a most excellent paper to have in the family. G. S. Wales.

Rochester, N. Y.

This makes three new subscribers I have sent you this year with no effort further than showing a single number of the Rural in each case. Had I not been pleased with it, I would not have done even this little. Every man who loves a cabbage, or a rose, or a glass of good milk, whether farmer, merchant, manufacturer, banker or laborer, ought to read the Rural on account of its high moral tone in its every department. C. J. Spaulding.

Jefferson Co., O.

What we like best about the Rural is the purity of its contents and its valuable information; but we would like it better if its bright, piquant face would appear daily. The Beauty of Hebron is worth the subscription price, so we get the best agricultural paper *free*. D. H.

Primrose, O.

The Rural improves, I had nearly said, with every number, and it must be considered the model agricultural journal. Its influence for good I know is very great.

Prof. E. M. Shelton.

Kansas State Ag. Coll.

Right worthily is the Rural leading all its contemporaries in enterprise. May it continue long to bless our farmers and others with its ennobling advice and instruction.

Nelson Slater.

Congratulations on your success. I am always glad to know of deserved success.

Cornwall-on-Hudson, N. Y. E. P. Roe.

I must say my advertisement of the Wooster Creamery in the Rural New-Yorker for the past year has been money well invested. I would recommend the Rural to all advertisers. M. D. Chapin.

Poultney, Vt.

I am much pleased with the Rural. I think with it as a guide, we farmers need not be humbugged by worthless fruits and vegetables.

Fayette Co., Ia. J. A. Rice.

Allow me to add a note of appreciation of the Rural. Some have spoken of the seed distribution as a premium. While the seed distribution is of great value, the Rural needs no "premium;" it is a "premium" of itself, the money paid for it is but a trifle compared with the value of its columns. Long may it "wave!" M. G.

Sim's Store, Ky.

I am very much pleased with the Rural. Cannot possibly imagine how it could in any way be improved. Horace C. French.

Chemung Co., N. Y.

We enjoy the Rural very much. 'Tis a welcome visitor. The Specials are *good*.

Ottawa Co., Mich. N. W. Bacon.

I am pleased more and more with the Rural; it teaches me in many ways.

Williamson Co., Tenn. W. H. Chappell.

An Appreciative Criticism. — We were very much pleased with, and interested in, the Rural's Cattle Number, and think it must have been equally interesting to all of your readers who are concerned with such matters. The frontispiece, "Netherland Queen, from a photograph," was particularly fine—the finest, we think, we have ever seen from a photograph. You are entitled to great credit and congratulations for the attractive and interesting manner in which you have presented this important subject to the public. Permit us to add ours to the many which you will undoubtedly receive. Smiths & Powell.

Syracuse, N. Y.

BOOKS, CATALOGUES, ETC.

Gardner B. Weeks, Syracuse, N. Y. Illustrated and descriptive price list of Grappling Hay-forks and Railway Hay Conveyors.

Premiums and Regulations for the 32d Annual Fair of the Ohio State Board of Agriculture, to be held at Columbus, August 30th—September 2d next.

Fourteenth Annual Report of the Secretary of the Connecticut Board of Agriculture. A very valuable work of 500 pages. T. S. Gold, Secretary, West Cornwall, Conn.

Garden Annual, Almanac and Address Book, published under the direction of W. Robinson, F. L. S., the "Garden" office, 37 Southampton Street, Covent Garden, London, W. C., England.

The Lincoln Patent Can Creamery. Sixteen sizes for all classes of dairies. An illustrated pamphlet of 12 pages. Address for copies William E. Lincoln, Warren, Mass., mentioning the Rural New-Yorker.

Transactions of the Indiana Horticultural Society, for 1880, being the Proceedings of the Twentieth Annual Session, together with reports from local societies, essays, papers, etc. W. H. Regan, Secretary, Clayton, Ind.

Commercial Relations of the United States. No. 7. May, 1881. This pamphlet of 161 pages contains reports from the United States consuls on the commerce and manufactures of their respective consular districts, and forms part of a series now being issued.

Illinois Crop Reports, being the consolidation of reports returned to the State Department of Agriculture to June 1st, 1881, a condensed summary of which has already appeared in the Agricultural News of the Rural New-Yorker. S. D. Fisher, Sec., Springfield, Ill.

Silver & Deming Manufacturing Co., Salem, Ohio. A beautiful catalogue of 115 pages of pumps, hydraulic machinery, carriage-makers' tools, butchers' tools, feed cutters, &c., manufactured by them. Finely illustrated with 200 or more wood engravings. For copies apply to the above firm.

Agriculture of Pennsylvania, containing Reports of the State Board of Agriculture, 296 pages; the State Agricultural Society, 198 pages; the State Dairymen's Association, 64 pages; the State Fruit Growers' Association, 74 pages; and the State College, 20 pages, for 1880. Thos. J. Edge, Sec., Chester, Pa.

Twenty-fourth Annual Catalogue of the Officers and Students of the State Agricultural College of Michigan, for 1880–1881. From this we learn that this model agricultural college had 221 students during the season just closed, including 33 seniors, 33 juniors, 53 sophomores, 90 freshmen and 12 specials.

The Shepherds' National Journal.—This is the first issue of a proposed quarterly paper on sheep industry, edited and owned by E. J. Hiatt, and published at Chester Hill, Ohio, price $2 per annum. It contains 32 pages of matter copied almost entirely from other papers and publications. In addition to the regular quarterly issue, a weekly supplement is promised during the wool-selling season, containing the wool markets and movements, prices of mutton sheep, etc. We wish this new venture all the success it may deserve.

Transactions of the Iowa Hort. Society for 1880. This handsome volume of 616 pages contains the proceedings of the Fifteenth Annual Meeting of the State Society, together with those of the Eastern Iowa Horticultural Society, as well as those of the Western Iowa Hort. Society and of other local societies for 1880; embracing essays and discussions in all departments of scientific and practical horticulture, with lists of trees and plants adapted to the several fruit districts. The work is well edited by Prof. J. L. Budd, of Ames, Iowa, Secretary of the Society.

American Pork.—This pamphlet of 49 pages is the result of an investigation made under the authority of the Department of State, into the subjects of hog cholera, trichinæ, and the manner of raising and disposing of swine in the United States. The investigation was instituted in consequence of the highly unfriendly action of France in peremptorily forbidding the importation of American hog products on February 18, last, and it clearly demonstrates that there was no valid ground for this hasty action. The pamphlet is published by the Department of State, Government Printing Office, Washington, D. C.

BEAUTIFUL IOWA.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the Rural New-Yorker.]

Beloit is in the extreme southwestern corner of Lyon Co., on the Big Sioux River, and on the Sioux City and Dakota division of the Chicago, Milwaukee and St. Paul Railway. It has a population of about 250, four church societies; (two edifices), a public school, a Lutheran Theological College, just removed here from Wisconsin, having for a faculty, a president and three professors a local newspaper, and the usual quota of business for such a town is well represented. The town was named by Hon. E. E. Carpenter, who removed here from Beloit, Wis., in 1873, and is now doing enough business almost to justify running him by steam power; a flouring mill, woolen mill, grain elevator, store, and dealing in real estate requiring his daily attention. He will answer all letters addressed to him about either his town or county. Light manufactories are needed here to utilize the water power of the Big Sioux, which can be obtained on favorable terms.

At Orange City, the county seat of Sioux Co. we had the pleasure of meeting Hon. Henry Hospers, one of the early residents, who has been the mainspring of *Holland* immigration from Holland. From him we gleaned these facts: The Holland colony was established in 1869, and then contained some 60 families which have since been increased to 600; there are 22 free schools, all English and three churches, Protestant-Reform. The attention of this class of population is turned to stock-raising and agriculture, their industrious and honest habits rendering them a valuable accession to a new country. "*De Volksvriend*," a Holland paper, is published by Mr. H. This, the shire town, is the largest in the country, (some 400 population) two and one-half miles from the C. St. P. M. & O. Ry. It has the court-house, a generous supply of stores, business and professional men and a very desirable location. The Sioux Co. Herald is a very creditable paper published here. We desire to thank Messrs. Pierce and Lewis (real estate), Bill and Lecocq (same), and C. W. Carter (same), for their very courteous treatment and commend Eastern readers to their care. From here we dropped down to

East Orange, a brisk little town of 200 people, which has grown up around the station. There we found two very neat churches—Reform and Catholic—a good school, and various business interests. It is an excellent shipping point. From Beach Bros., who handle a large portion of the grain, we learn the shipments of last season's crop exceeded 110,000 bushels. D. Gleysteen (the senior of one of their large stores) is in Holland now, looking up among other interests the immigration of that nationality. A ride of 24 miles across the rich country we have spoken of, brought us to the southwest corner of the county, and we found

Calliope with its 125 population—allegorically spreading its wings for an ascent. It is on the Sioux Falls Branch of the C. M. & St. P. Railway, nestling by the Sioux River, which will be bridged here this summer. There is a fall of six feet to the temporary dam, and a mill would be a god-send to them. There are also opportunities for drugs, a blacksmith, harness and other business interests incident to a growing town. With a good newspaper and good school, there is no lack of the instructive element. We learn that W. P. Cutler, of Marietta, Ohio, owns one-half the town-site; and from him or of A. W. Heald, further information can be obtained Taking the branch we next made Rock Valley at its junction with the main line and I. and D. division C. M. & St. P. Besides being a junction this "healthy infant" (about 100 population, 3 stores and 2 hotels) is nearly in the center of this beautiful agricultural region, pouring its ever increasing wealth into its coffers for shipment. It has a splendid water power, and a good mill will soon be built. There is a school and two religious societies will soon be organized. For this point we commend a correspondence with James E. Douglass (real estate), Burnell Bros. (general stock) Richard L. Rowe (same, a new store) or Dr. E. O. Plumbe.

Pattersonville, nine miles east, on C. M. and St. P., is the largest railroad town in Sioux Co., being about 400 population. There is a good Methodist church, Catholic soon to be built, Congregationalist expected this Summer, a pithy local paper, a set of business men who have the go-ahead and push to make their town a good one. A bank will be started ere this article appears, the second in the county. Civic societies are in flourishing shape; schools, well attended and ample for the population, and this standing for a town of only two-and-a-half years of age. It is a marvel to the steady-going farmer of the East, truly. Beach Bros., of East Orange, have also a large business here. To these and the other gentlemen who tendered us their aid in eliciting truths for our correspondence, we say many thanks.

THE INSECT WORLD.

Where do these Pests Come From, and Where do they go to?

In Ontario County, N. Y., about the year 1856, I saw some currant bushes nearly denuded of their leaves by a loop, span, or measuring worm which showed itself in great abundance in all its various attitudes. I have never seen a specimen of it since, or heard tidings of it till a few days since when I found my half dozen gooseberry bushes plentifully infested by the same worm. I showered the pests and dosed them with ashes which simply disturbed them. Caring little for the gooseberries, which are more plague than profit, and fearing for the currants near-by for which I have a profound respect, I placed paper under the former and set it on fire, pitching all I could see into the blaze. In a day or two I found them on the currants sure. By careful hand-picking we have greatly reduced their number, hoping to save some fruit thereby, which we would not have dared to eat had we used poison. I find the same insect on my other garden half a mile off and one-fourth of a mile from any other currants or gooseberries, and I learned that this same worm appeared in the neighborhood last season.

Learning from the American Entomologist (Vol. 2, page 14) that this worm breeds but once in a season and that the moth leaves its eggs on the twigs and branches in July or August, to be hatched the next June, I conclude to wait till the eggs are deposited and, so far as the gooseberries are concerned, to cut them up and burn them. As the gooseberry seems to be its preference, I hope by this and other means to save some currants next season. This is claimed to be a native American. As to this other green gooseberry and currant worm not a looper, claimed to be an importation and producing two generations in a season, I encountered them, or they me, about 15 years ago, and learning that their mother, the sawfly, remained in the pupa state in the ground under the bushes during Winter, I plugged them up there with a plaster of lime mortar of 20 or 24 inches diameter early in the Spring, and they have never troubled me since.

The pear slug that has infested the pear, cherry, quince and mountain ash for the past few years, I have not yet seen this season. Neither have I found the green lice on the currant, apple or plum trees, nor the small black lice on the cherry tips, or on the grapes which they occasionally infest. Are they yet coming? is a serious question. The thrips, too—Tettigonia vitis—that were here in destructive abundance the two past years, are at least thus far delayed, though the Clinton, their special favorite, has blossomed five days earlier than last year. If these tiny thrips do not appear at all, I shall not regret the preparation I have made for them and which was successful last year where thoroughly applied, to wit, ten pounds of quick-lime and four pounds of sulphur slaked together and put in 30 gallons of water and applied on the upper and under sides of the leaves with a whisk or garden pump. Try it, you who are pestered with these little nuisances—I can conquer them with nothing else.

The past has been a hard Winter on this Lake Shore, and the lessons it has taught us are that it is unreasonable for us to expect but occasional success, even in this reputed peach belt, with any of the tender fruits except in well chosen aspects. I have just visited a twenty-acre Concord grapery with great masses of winter-killed wood with swarms of suckers and little evidence of fruit in prospect, and another piece of one and a half acre including the same variety, half a mile distant, where there were 35 varieties and all except three in fine condition with scarcely any dead wood. The soil was the same in both pieces, the difference in the present appearance having been caused partially by the Fall or Winter pruning, but mainly by the difference in aspect, the former being on a dead level and the latter on a slight inclination. I might tell the same story of peach orchards in the same neighborhood, the difference there, too, being caused by the same good and ill-chosen or shaped grounds. All tree fruits bore in excess last year, and most of the trees showed blossom this Spring, but many failed to set fruit.

Muskegon, Mich. S. B. Peck.

For Women.

CONDUCTED BY MISS RAY CLARK.

IF ONLY MOTHERS KNEW.

If only mothers knew, she said,
How hungry children are for love,
Above each virgin little bed
A mother's lips would prove
How sweet are kisses that are given
Between a rosy mouth and heaven.

If only my mamma would kneel,
As your dear mother, every night,
Beside her little girl, to feel
If all the wraps are folded tight.
And hold my hands, her elbow fair
Between my cheeks and her soft hair.

And looking in my dreaming eyes
As if she saw some lovely thing,
And smiling in such fond surprise
On all my hopes of life that spring
Like flowers beneath her tender gaze,
I could not stray in evil ways.

I would not wound the gentle breast
That held me warm within its fold;
My mother's love would still be best,
However sad, or plain, or old:
And, even though the world forsake,
I'd love her for her love's dear sake.

DESCRIPTION OF CUTS.

FIG 342.—THE OLYMPE HAT, of Black Chip Straw, embroidered with beads. Boullion velvet edge. Two velvet draperies go round the crown. Bunch of buttercups at the left side.

FIG. 343.—DRESS FOR LITTLE GIRL FROM FIVE TO SEVEN YEARS OF AGE.

The dress is of pink checked cambric with trimmings of the same.

FIG. 344.—HOME DRESS.

The dress is of sorrel-green velling. The drapery of the polonaise is bound with striped satin of two shades of green.

FIG. 346.—HOME DRESS.

The dress is of sand-colored beige. The skirt

FIG. 342.

is trimmed with alternate kiltings of beige and mahogany-colored surah; the tunic and jacket are trimmed with a cross-fold of surah.

FIG. 347.—DRESS FOR YOUNG LADY.

The dress is of beige, trimmed with guagings of the same.

FIG. 345.—NETTED NIGHT-NET.

This night-net is particularly recommended to persons who suffer from headache, as it keeps the hair closely together without any pressure on the head.

Materials required—Crochet cotton No. 4, netting-needle, and mesh about quarter inch wide.

Commence with twenty-two stitches, and net backwards and forwards fifteen rows, and then take out the foundation thread, draw it through

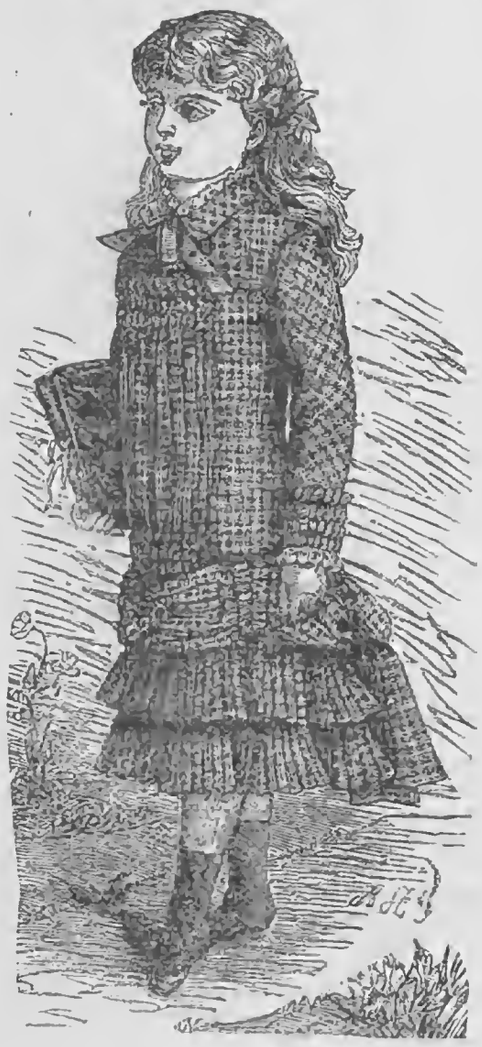

FIG. 343.

the middle of the oblong. Now work round and make one knot in each stitch of the preceding row; there must be eighteen rows netted round, or more if not large enough; then follows the broad row for the ribbon to pass through; for this take a half-inch mesh, or put the cotton twice round the small mesh at every stitch. After this broad row work two rows over the first mesh, then follows the narrow lace for the outer edge; for this net one row over the broad mesh, making always five knots in one stitch, passing over the

FIG. 344.

next stitch. Now take again the small mesh, and pass over again in each row the same stitches that were passed over in the first row, whilst in the rest one stitch must be made in each stitch of preceding row until there is only one stitch to work, and the next to pass over alternately.

This ends the lace.

Draw a ribbon through the broad row of netting, and tie it at the back (see design), and sew on the bow at the top.

FIG. 348.—The hat is of Tuscan straw; the brim bound with cardinal satin, over which is placed a fancy Tuscan gimp; it is trimmed with satin, shaded feathers and gold comb ornaments.

HUMANIZING LESSONS.

Two of the most frequently quoted lines of Ovid are those in which he says that to have faithfully

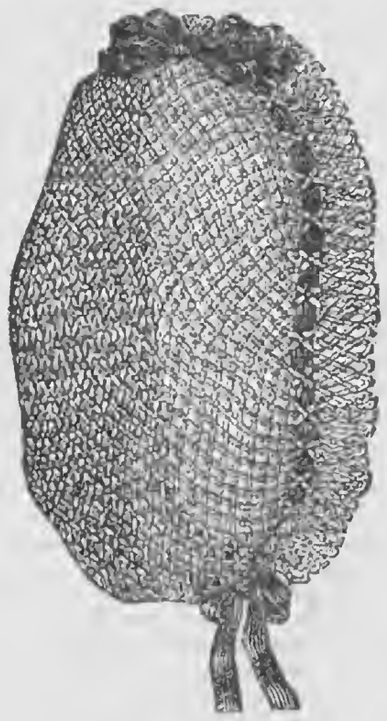

FIG. 345.

learned the arts of reading and writing softens the manners and makes ferocious savagery impossible. Modern experience proves that although these "*humaniores artes*" are essential towards the forming of a gentle and good disposition, they are not the real key to the question, which has after all a very simple solution. Mr. Grigorieff gives a hint of it in a paper lately read at a meeting of the St. Petersburg Society of Gardening. He says, that the Japanese are all taught gardening in schools, and all have their little plots of ground at home. The children are not only instructed in practical horticulture but in the artistic arrangements of flowers, and the culinary uses of vegetables and fruits. Nowhere else are gardens so universal or so skillfully kept. There is a passionate love of the occupation everywhere, from the palace to the cottage. The dwarf oaks and other trees which they take such pride in, become living heir-looms; one specimen often having the successive culture and care of three generations.

Now Miss Bird tells us in her Unbeaten Tracks in Japan that the most notable and beautiful feature of Japanese life is the universal kindness, gentleness and happiness seen in the manners of the children, and in the intercourse between them and their parents. It seems as if long generations of courtesy and complaisance, had almost extinguished the passions of anger, envy, spitefulness, and contrariness which break out so soon and rage so inflammatorily among the children of the West. For Miss B. declares that she saw nothing but quiet and good-will among Japanese children, no scolding, no snubbing, no petulance or pouting; no disobedience of a younger to an older child, or to parents or teachers; no case of quarreling, or any apparent need of correction. She saw no beating of a child in all her journeying, nor anything to provoke or deserve it.

Putting M. Grigorieff's and Miss Bird's testimony together, do they allow us to believe that human nature is every where the same fundamentally or do they prove that the Japanese children, who behave in everyway like ours, excepting in proneness to ill-temper, are yet of a radically different moral constitution? If we adhere to the first of these two views—the one generally held—must we not conclude that our school methods are defective; that we do too much violence to the child's nature and to Nature itself, in fastening the little beginners to desks and books; confining them, at the outset, to the hardest, most unreasonable and bewildering work of all their school life, that of mastering English spelling and reading; a task which adults fail in, but which we regardlessly force little children through by endless practice of repetition, backed by time and threats and irresistible power.

We give them at this critical stage the poorest instead of the best of teachers, and instead of first exciting a desire to learn a word—which makes its learning easy and its acquisition permanent—we poll-parrot it with a string of others, into the dinned ears and brain, no matter whether it is understood and meets with a sympathetic chord of sense in the chambers of the mind or not. Let us study nature and facts, as well as books and

FIG. 346.

take, ourselves, some lessons from the kindergarten of Froebel, and from the genial methods of the Japanese.

MRS. GARFIELD IN THE WHITE HOUSE.

MRS. HAYES never had a sick day in her four years' stay at the White House, though the old house which she loved had all the defects then which it is declared have overpowered Mrs. Garfield in two months. There was nothing more remarkable about Mrs. Hayes than the never exhausted stories of her vitality and the splendor of her health. If Mrs. Garfield has erred it has been in attempting to do all that Mrs. Hayes did. What was pleasure to Mrs. Hayes to the same extent could only be a burden to Mrs. Garfield, solely through unequal strength. Mrs. Garfield is a woman of strong mentality, deep sweetness of nature, and the most fine and delicate fibre. The burden of crowds of "shows," of pomp and circumstance should never be laid heavily upon her. Mrs. Garfield is not Mrs. Hayes. She should be judged by her own standards and cared for for her own sake. She should never be compared to Mrs. Hayes nor to anybody else, but taken for herself. For who that truly knows her can fail to say that a woman ever stepped higher in worldly honor who more innately deserved it? Unassuming, gentle, "most womanly," in that old-fashioned sense, ever dear to the world's heart, our prayer to God is that she may be speedily restored to her husband and children, and to so much of the proud world as she can take without abusing herself.

—Mary Clemmer in the Independent.

[The above was selected before the occurrence of the terrible blow to Mrs. Garfield, and the country. Considering it still appropriate we insert with extended sympathy. Were she possessed of perfect health her situation would warrant the most heartfelt consideration, but under existing circumstances the fever of condolence should be allowed, if possible, to reach still greater high[t

FASHIONS.

Bonnets are pretty, and all the more becoming, because each lady seems to study her own style of face and figure in choosing one. On the whole, ladies seem to cling more than ever to the small capote. This is now worn very far on the back of the hair, showing the hair, which is braided,

FIG. 347.

smooth, or waved in graceful ripples low over the brow. The fringe is quite gone out of fashion, but waved bandeaux are in great favor, though low over the eyes they are brushed off the ear, and a low chignon of coils and plaits is fastened at the back.

Fans are now shaded. They are made of well selected feathers, so beautifully arranged that half the fan is of the dark shade and the other half of the light, and sometimes the edges are dark and the feathers shaded upwards to light colors in the center.

Shirred waists, with shirred yokes and belted in fullness at the waist line, appear among late novelties.

Ombre or shaded Surah is in demand for collars, cuffs and revers of suits of sober or neutral tints.

Many small tucks, much shirring and fine embroidery are the adornments of mull muslin toilets.

THE SECRET OF BEAUTY.—The secret of beauty is health. Those who desire to be beautiful should do all they can to restore their health if they have lost it, or to keep it if they have it still. No one can lay down specific rules for other people in these matters. The work which one may do, the rest he must take, his baths, his diet, his exercise, are matters for individual consideration, but they must be carefully thought of and never neglected. As a rule, when a person feels well he looks well, and when he feels ill he looks ill. There are times when one can guess, without looking into the glass, that his eyes are dull and the skin is mot-

FIG. 348.

tled. This is not a case for something in a pretty bottle from the perfumer's, or for a lotion that advertisements praise so highly. To have a fresh complexion and bright eyes, even to have white hands and a graceful figure, you must be well. Health and the happiness which comes with it are the true secrets of beauty.

Literary Miscellany.

"UNCLE DAN."

EDGERTON.

SADLY and slow went "Uncle Dan,"
Trudging through the farm,
His butter-firkin stowed with rolls,
Was banging on his arm,
And in his other hand he held
A basket filled with eggs—
A goodly load for his stiff back
And tired, plodding legs.

Each Saturday, for many years,
He'd trugged off thus before,
To get his mail, and barter truck,
For nick-nacks, at the store.
He once had bragged his bank had been,
His cows and "Plymouth Rocks,"
Whose solvency could not be swayed
By rise and fall in stocks.

Alas! poor Dan! he sees it now,
His wisdom counts for naught,
For even banks as sound as his
With dangers may be fraught,
And though they really may not break,
Nor actually suspend,
He must confess that it amounts
To just that in the end.

The price of butter does not pay
For time and labor spent,
Since greasing bread with "Oleo,"
Gives pleasure and content;
And chickens are so numerous, since
They hatch them out in pens,
That laying eggs will hardly pay
The worry of the hens.

His butter last week, only brought
A fip'any bit a pound
While eggs—well eggs no market had—
Were loosely kicking round;
His ten-cow dairy, once supplied
His family's every need,
While now, it scarcely would suffice
To keep him in "the weed."

"Just what the world is coming to,"
Said Dan, "I cannot tell
But that it's rough on farmer folks,
This much I know right well;
I can't tell, for the life of me,
Why things don't take a change,
We surely ought to regulate
These matters through the Grange."

MY EXPERIENCE.

Continued from page 458.

CHAPTER II.

"MABEL, don't you like Cyril?"

Mabel looks up with a start from her writing as I propound the above question one morning about a week after my return home. We are alone in the breakfast-room; a pretty little apartment with French windows opening into the garden, through which the sun is streaming gaily. Built out from one of them is a little conservatory—my especial care—for it contains all my favorite plants and blossoms; while through the other window by which I am standing I can see the garden with its profusion of summer flowers. Cyril is sauntering up and down the path. I am ready in my shady hat and cool print dress for a saunter through the lanes with him, but I am in no hurry to be off, having something to say to Mabel before I go.

My sister is busy with her account books, and looks pale and weary—the heat seems to try her more than usual this Summer; but I am not unselfish enough to leave her in peace until she sets my mind at rest about something which is troubling me greatly just now.

"Mabel, don't you like Cyril?" I repeat, more earnestly, when I meet the swift, questioning glance of her beautiful, velvety brown eyes—eyes which have such sadness and yet tenderness in their depths.

"I like him very much, Gracie," she answers, in a somewhat troubled voice. "I think him worthy of all respect and esteem."

"Respect and esteem," I repeat, contemptuously.

"I don't want you to respect and esteem him. I want you to like him as a brother."

She smiles a little sadly, and bends her head again over her work.

"You see, Mabel, if you don't like him, you will never care to come and see us; and I could not be happy without you."

"Not happy—with Mr. Vernon!"

"Mr. Vernon! There, I see you don't like him. Even the children call him Cyril—and you call him Mr. Vernon."

"He calls me Miss Ord."

"That is because you are so stiff and cold to him. Mabel, won't you try to like him?

"Gracie, I have told you that I do like him," she answers very gently.

"Then why are you not cordial to him?"

"I am cordial, dear—at least, I try to be."

"You are not—you don't try!" I reply, impatiently. "I am sure Cyril has noticed your manner."

"I am sorry if my manner displeases him," she answers, rather haughtily. "but I am afraid that I am too old now to alter it. I have told you," she adds more gently, "that I esteem Mr. Vernon highly, and that I think you are a very fortunate girl to be loved by him.

But it is not essential either to your happiness or his that he should like your old-maid sister, so you need not let his want of appreciation of her manifold charms trouble you."

"But, Mabel, I am sure he likes you."

"And I like him. Therefore, put your heart at rest, my child. You have kept him waiting quite long enough for one morning, and he won't like me any the better for detaining you. So be off."

She pushes me playfully out of the room and goes back to her writing-table, while I join Cyril in the garden, and we start together on our walk. At the end of the lane we meet Fannie and Jack Edmonds and Cyril proposes that they should join us, for which I am not sorry, for my *fiance* is in a silent mood, and not very companionable this morning; nor does it lessen my pleasure, in the sweet Summer freshness and the blue sky overhead when he suddenly recollects an important letter which must be written in time for the mid-day post; and without hesitation I let him return alone to the house.

It seems almost like old times to be alone with Fannie and her brother—like the dear, merry old times, before there were any such things as lovers and engagements and diamond rings. We chatter and talk nonsense and laugh at the nonsense as if it were the most brilliant wit; and it seems to me that the sunshine is less brilliant when they leave me at the gate. I go slowly up the path, up and down which Cyril had paced two hours ago, and recollecting that I had not yet filled the vases in the drawing-room with flowers, I open the door of my little conservatory and take a pair of scissors from the shelf. The door leading from the conservatory into the morning-room is open, and through the shading lace curtains I can see Cyril seated at the table writing; but I do not make my presence known to him, while my movements are noiseless enough to escape detection. He is alone; but I have not been a minute in the conservatory when the door of the morning room is opened, and Mabel comes in. She is reading a letter, and does not perceive Cyril until she has entered the room and closed the door after her; then she sees him, and stands still, growing as white as the dress she wears.

There is a moment's dead silence. Mabel turns towards the door and Cyril rises hastily.

"Do not let me frighten you away," he says, formally, but with a curious hesitation in his deep voice.

"It does not matter," Mabel answers, in a confused tone, and still keeping her hand on the door-handle. "I will not disturb you."

"I have finished my letter," he says, hurriedly; "and—and I want to speak to you."

She comes slowly back into the centre of the room, and stands by the table, looking so pale that I am afraid she is going to faint. There is another silence. Cyril is standing also, but his back is turned towards me, and I cannot see the expression of his face. I feel a little excited and curious, and my humiliating position of eavesdropper does not strike me; so I stand still, wondering what will come next.

Cyril breaks the silence first.

"You have avoided me so persistently during the week I have spent under your father's roof," he says, calmly, "that I have no opportunity of giving you an explanation, which you have a right to expect. When I asked Gracie to be my wife, I did not know she was your sister. When I started with her I did not know we were coming to your house.

"I do not need any explanation," she answers, in a faint, tremulous tone, very unlike her usual calm, rich voice; "and I am sorry that my presence here——"

Her voice fails her, and she stops short. Cyril makes a step towards her, but restrains himself by a strong effort.

"So many years have passed since we met," he says, in the same calm tone of voice, "that we can fairly meet as strangers; but I think your sister feels that——Mabel," he breaks off suddenly, and speaks with a sudden passion, "why did you treat me so?"

She lifts her eyes to his with one swift, surprised glance.

"I do not understand!" she says, faintly. "What do you mean?"

"Why did you leave my letters unanswered?"

"I received no letters from you," she answers.

"No letters! Ah! Mabel, be frank with me. Have you forgotten the letters—there were three—I wrote you after I left you.

"I received no letters from you," Mabel repeats, very quietly, and she rests her hand upon the table as if she needs some support.

Cyril utters an exclamation of intense pain, and makes two or three strides up and down the little room. As he turns, I can see his face. It is as pale as my sister's, and he is evidently deeply agitated. Presently he turns to Mabel.

"What do you think of me? he says, huskily, and the stony calm of Mabel's face is broken for a moment, but she makes no answer. "You will let me explain?" he says, entreatingly; "I owe it to you and myself to do so. When I was obliged to leave you so suddenly I left a letter on the hall table, explaining the reasons for such a sudden departure, and begging you not to judge me severely. I was then under a promise to my uncle not to make any engagement without his consent, and when I left I went direct to Vernon to win him over. I had told you that I loved you," he added, unsteadily. "I had not been able to refuse myself the pleasure of making my confession, and of hearing from your own lips that I was not quite indifferent to you; but hardly had I done so than I recognized how wrong I had been. I wrote to you, explaining as well as I could my obligations towards my uncle and my position with regard to him. When I had been a week at Vernon I wrote again. I told you in that second letter that as yet I had been unable to obtain my uncle's consent to our engagement; he had other views for me; and I prayed you to trust me a little longer and to send me one word of encouragement."

He pauses for a moment. Mabel has not moved, but stands pale and tremulous, leaning heavily against the table. I, in my place of concealment, listen with eager interest, forgetting completely how much I am concerned, and feeling like a person at the play feels when deeply interested in the performance and eager for the *denouement*.

"The second letter, like the first, remained unanswered," resumes Cyril, "and I wrote again, entreating a reply; and in this third letter I said that I would accept silence as a proof that you had been mistaken in your feelings towards me—that you did not love me. That is ten years ago, Mabel, but I can remember even now the agony of expectation with which I awaited your answer—an answer which never came. I remember still the despair and misery I felt then. I loved you so wildly, so madly, that it broke my heart to think that you had been trifling with me; that you had not meant the words when you said, "I love you, Cyril. I will be your wife."

Mabel raises her hand for a moment with a quick gesture, which seems to entreat silence; but Cyril is too much in earnest to heed her movement; he goes on rapidly in the same husky, unsteady voice, and I can see that he is as deeply agitated as Mabel herself.

"I think it almost killed me," he continues. "When I was able I went abroad; my uncle, who pitied my wretchedness, gave me the superintendence of his sheep-station, and I remained in New Zealand until last March, coming back with a strong yearning for a home and near ties. My uncle died six years ago."

"You know now that I received no letters from you," Mabel says, forcing herself to speak calmly, but failing miserably. "They never reached me and it is too late now to think of discovering how they were lost. I am sorry—ah! sorry is hardly the word—that you should have suffered. I, also, have not been happy sometimes, but, as you say, it is a long time ago, and time is the best comforter, and you are happy now."

"Happy now!" he repeats with a bitter laugh. Happy, when I see the happiness which I lost through treachery! Do you think that I do not understand now who betrayed me—who detained those letters? Charles S—— loved you, and ——"

"Hush," Mabel interrupts softly. "It is ten years ago."

"Ten years of loneliness and misery—ten years of wretchedness which might have been ten years of joy! You have not been happy—I can read that. My darling, my darling, if I could forgive him the ten years of suffering I have known, could I forgive him if he has given you even ten days' pain!"

He has both her hands in his, now, and is looking down at her with a passion of love in his dark eyes—ah! such a different expression from the kindly gentleness with which he looks at me.

Mabel struggles faintly to release her hands.

"Gracie," she says faintly, in a voice so low that I seem to know what word she has uttered more by the movement of her lips than by the sound.

He drops her hands with a swift, sudden movement, and draws back from her. My name has recalled him to the present and his engagement, and he is loyal and honorable, no matter at what cost to himself.

"I had forgotten," he says brokenly, and there is a silence which seems to me interminable—a silence which Mabel breaks at last—

"I am glad to have heard your explanation," she says, faintly. "Glad for my sister's sake. When you wrote to my father, it almost seemed that it would be my duty to tell him of that episode in my life which had seemed to prove unworthy of such sacred trust as our darling's happiness; but from the first I did not think that you had meant to deceive me. And I am glad—ah, believe me—truly glad that you are happy now—and I wish you both every joy and blessing."

"That I am happy now! Ah! Mabel, can you think that I am happy—I, who was drawn to Gracie by her likeness to you—I, who love you. Heaven help me! with a passionate, unutterable affection—an affection which not even the thought of your unworthiness could dispel Mabel, if you had received my letters, what would your answers have been?"

"You have no right to ask that question now," she answers, faintly. "Have you forgotten that you have won Gracie's love, and that her happiness is at stake?"

"I have not won her love," he says, bitterly. "How was it possible that a bright, happy child like Gracie should love a reserved, disappointed man like myself? It was a selfish expedient on my part—a vain endeavor to infuse some brightness into my lonely life! What right had I to sacrifice Gracie? She cares far more for that lad with whom I left her a short time since. And yet, Mabel, I would have tried to make her happy—I would have spared no trouble."

To be continued.

MAGAZINES FOR JULY.

Ehrich's Fashion Quarterly, for Summer 1881; Phrenological Journal; Domestic Monthly; Lippincott's Magazine; Harper's Magazine; American Naturalist; Musical Herald; Godey's Lady's Book; Scribner's Monthly; Young Scientist; Our Little Folks; Atlantic Monthly; Appletons' Journal; St. Nicholas.

Space being limited we merely note receipt of above periodicals, recommending the contents from the popularity of former issues.

More health, sunshine and joy in Hop Bitters, than in all other remedies.—*Adv.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CHIPS.

CHERRY juice will not jelly without gelatine.

Compotes are fresh fruits, boiled as needed, with but little sugar added.

Mixed greens are far better than all of one kind.

Don't borrow—that is, don't make a practice of doing so.

Stone, and sift granulated or powdered sugar over cherries and let stand several hours before eating. It adds to their richness and flavor.

For mosquito bites, bathe with a solution of carbolic acid and glycerine—60 drops of the acid to an ounce of glycerine.

To wash delicate-colored muslins, boil two quarts of wheat bran in soft water for half an hour and use it instead of soap-suds. It removes dirt the same as soap and does not fade the goods. The water should be quite cold.

DRAPING LACE OR MUSLIN CURTAINS.

A FAVORITE method of arranging airy curtains is for the right hand side to cross the left one a little more than half way up the window. A large satin bow of ribbon to harmonize with the room, is fastened on the curtains where they cross each other. Each curtain is then fastened back to the window by a somewhat smaller bow.

TO CAN GREEN PEAS.

PROVIDE strong, new tin cans with the necessary conveniences for soldering. Pick the peas from the vines, shell and cook at once. They should be boiled 15 minutes in water sufficient to cover. Fill the cans with peas within half an inch of the top, pour in liquor to fill to the brim. Wipe the groove dry, put on the cap and solder air-tight. Make a puncture with an awl in center of the cap, place the cans in a boiler of hot water to boil for an hour. The water should not cover the cans. It is best to have the bottom of the boiler covered with old crockery, wooden slats, or in fact anything to keep the cans off from the bottom. With a needle open the puncture to allow of the escape of gas and steam. Seal up with a drop of solder, and return to the water to boil two hours longer.

COOK.

DOMESTIC RECIPES.

Lemon Snaps.

One large cup of sugar, two-thirds cup of butter, two beaten eggs, two tablespoonfuls of hot water, half a teaspoonful of soda, flavor with lemon and flour to mix. Roll very thin. Bake in a quick oven.

Corn Soup.

Cut only the top of the kernels from the cob scraping off all that remains. To a quart of this corn add two quarts of hot water. Boil for an hour, then pass through a colander. Into a stew-pan put two spoonfuls of butter, when it melts stir in a large spoonful of flour. Stir in the corn add a pint of hot milk and a cupful of cream. When it comes to a boil season with salt and pepper.

Candied Fruits.

Boil peaches, pears, plums, cherries, citron or quinces in a thick sirup—a teacupful of water to a pound of white sugar—until tender. Take from the fire and let remain in the sirup two days. Take out, drain, sprinkle sugar over each piece and dry in a cool oven. MRS. E. B.

Spiced Chicken.

Boil three chickens until the meat will fall from the bones, free the meat from fat and skin and chop fine; season with cloves, allspice, pepper and salt; pour over a pint or more of the liquor in which they were boiled; turn into an earthen dish, place a plate with a weight on top and let stand several hours in a cool place before slicing. A. B.

Currant Jelly.

Crush the fruit and strain the juice. Weigh the juice and put over the fire in a porcelain kettle. Let come to a boil, then stir in pound for pound of granulated sugar. As soon as it boils again remove from the fire and turn into tumblers, as it jells very quickly. Place the glasses on a wet cloth before filling with the hot liquid. Jelly should not be cooked. E. P.

QUESTIONS ANSWERED.

Otto of Roses.

PLEASE give directions for making the above and oblige R. M. LUDLOW.

ANS.—Fill a large glazed earthen jar with rose leaves carefully separated from the cups: pour over them spring water just sufficient to cover them, and set the jar with its contents in the sun for two or three days, taking care to put it under cover at night. At the end of the third day, or so, small particles of yellow oil will be seen floating on the surface of the water, and these in the course of a week will have increased to a thin scum. This scum is the otto of roses. Take it up with a little cotton tied to a stick and squeeze it into a phial.

Angel's Cake.

Please give recipe for the above and oblige a CAKE MAKER.

ANS.—Four ounces and a heaping tablespoonful of flour, twelve ounces of powdered sugar, the whites of eleven eggs beaten to a very stiff froth, (flavor with rose before beating) a teaspoonful of cream-of-tartar and a little salt. Mix the sugar, flour, salt and cream-of-tartar together and sift through a very fine seive six times. Then stir in lightly the beaten whites. Bake in a *new* pan, without greasing, for 40 minutes. After taking from the oven, invert the pan and place upon cups or tumblers until the cake is cold, then remove and cover with a thin icing. No soda is used. A pan with a tin tube in center is preferable for baking.

NOTE.—Please give my thanks to Mary Wager-Fisher for her article in the RURAL of June 18. It is exactly the help I desired to induce my wife to consider her health before anything else. The advice is priceless to those who heed it, and the more we have like it the better. SUBSCRIBER.

Suffer on, Groan on, Sicken on, Die on, if you will not use Hop Bitters and be cured.—*Adv.*

News of the Week.

HOME NEWS.

MONDAY, July 11, 1881.

Owing to an erroneous telegraphic dispatch which was received just at the moment of going to press last week, we reported the death of the President, but his rapid decline at that time was simply a relapse from which he recovered. At this writing he is still improving, though the ball has not been extracted. It lies in the vicinity of the liver so that recovery will be little less than miraculous. The ball passed between the tenth and eleventh ribs fracturing the upper edge of the eleventh rib, then probably passing into and through the liver and the abdominal cavity. It is feared that the spinal column has been injured. Mr. Garfield's wonderful powers of endurance, and his strong constitution have enabled him to battle with his wounds more successfully than a delicately constituted man could have done.

The assassin—whether a fool or a lunatic, it is hard to say—takes things remarkably coolly. He is vain, egotistical, jealous, revengeful, in fact, almost any disparaging epithet is applicable to him, and his previous history shows that there is a weak spot in his head somewhere. Two or three other persons have been arrested for threatening the life of Secretary Blaine and Vice-President Arthur. All parts of the country and nearly, if not quite, all of the foreign nations have been in almost constant communication with Washington to learn of the President's condition. The crowned heads of Europe, and especially the Queen of England, have expressed the deepest sympathy for the stricken family and nation. The latest reports this morning announce continued improvement.

Should the wound inflicted on the President terminate fatally, Guiteau would be tried for murder; but, should the President recover, his assailant could only be tried for having committed an assault with intent to kill, the penalty for which is prescribed in the following section of the District of Columbia code:—

SEC. 1160. Every person convicted of manslaughter, or of any assault with intent to kill shall be sentenced to suffer imprisonment and labor, for the first offence for a period not less than two nor more than eight years, and for the second offence for a period of not less than six nor more than fifteen years.

On ascertaining this legal provision, a general expression favors an amendment to the Federal Constitution, making an assault upon the President or Vice-President of the United States, treason and punishable by death.

Mr. Garfield has throughout borne his suffering and the consciousness of peril with great fortitude, and even with cheerfulness. The country will fully value the manliness of his bearing in this period of supreme trial. Should he escape, as now seems probable, the gratitude of the nation will be increased by this exhibition of courage and self-control. And we may add that general sympathy will be felt for the tenderness and consideration which the President has manifested toward his unfortunate wife, for whom his apprehension has constantly been greater than for himself.

At a meeting of the Chamber of Commerce in this city on the 7th inst., it was resolved to raise a fund to be kept invested in Government Bonds, and the income thereof to be paid to Mrs. Garfield during her life and at her death the principal is to be divided among the surviving children of James A. Garfield. The sum of $46,500 was subscribed on the spot, and it is expected to make the fund $250,000. At present about $130,000 have been subscribed.

There is some hopes of an end to the senatorial struggle which has been prolonged *ad nauseam*, at Albany. A caucus was held on the 8th inst. more than a majority of the Republican members of the Legislature being present. Mr. Depew, who has been one of the most prominent candidates for Senatorial honors, sent in his resignation to the caucus, which was accepted. This action on the part of Mr. Depew was quite unexpected but he withdrew in the interests of harmony. The caucus proceeded to select two candidates for the vacancies made by Conkling and Platt, and Elbridge G. Lapham was chosen as the caucus candidate for the former's place and Warner Miller for the latter's.

A dispatch from Warrenburg, Mo., says a whole boat-load of picnickers, 600 in all, partook of lemonade that had been poisoned with acid. Eight have died, and a hundred are in a critical condition. The vender was arrested and will be prosecuted. Public indignation is excited, and the community is in mourning.

The net earnings of the Lake Shore and Michigan Southern railway for the year ending June 1, were $3,490,000, against $4,053 616 the year before.

The excitement among visitors in the country, on the Sunday following the President's attempted assassination, who desired to obtain the New York papers, was intense. On the line of the Erie in New Jersey the rush at the stations was extraordinary. The first cry was: "How's the President?" and as the papers were delivered nobody waited for change. A gentleman reached Paterson with three papers in his hand, and as he stepped from the train was asked if they were for sale. He jokingly replied, "Yes, for 75 cents." Before he finished the sentence they were snatched from his hand and a dollar was left in their place, while the buyer hurried away. At one station a newsboy received $7 for 13 papers, and at another $9 for seven papers. Some people offered $3 and $5 apiece for papers.

The Fourth of July jubilee under the auspices of the Bi-centennial Association of Pennsylvania came off on the 4th at the main centennial building. The event was to inaugurate the two hundredth anniversary of the landing of William Penn and the founding of the commonwealth. The exercises consisted of singing and speeches, appropriate allusion to the President being made.

Secretary Hunt has appointed a board of officers which includes Rear Admiral John Rodgers and Commodore W. G. Temple, who will consider the following subjects: The number of vessels that should now be built, their class, size and displacement; the nature and form of their construction; the nature and size of the engines and machinery; the ordnance and armament necessary for each; the appropriate equipment and rigging for each; the internal arrangements of each, and such other details as may seem necessary and proper and the probable cost of the whole of each vessel when completed and ready for service. This looks as if our alleged navy is to be reinforced.

On Monday the citizens of Bloomington, Ill., celebrated the fiftieth anniversary of the incorporation of the city. Senator David Davis presided.

It is said that the special train with Mrs. Garfield on board on her way to Washington, had a very narrow escape from destruction. While en route to Washington the parallel rod on the side of the engine broke and tore the side ties to pieces for two miles before the train could be stopped. Had the engine left the track the car would have been dashed to pieces. Another engine was secured, and Mrs Garfield arrived safely at a late hour.

The public debt was reduced $101,573,483 during the fiscal year ended June 30. The debt is now $1,840,528,811 or $451,432,023 less than it was ten years ago. Since 1875 nearly one-third of the debt has been paid.

The statue erected over the grave of General McPherson, at Clyde, Ohio, will be unveiled on July 22. It is expected that members of the Cabinet, Generals Grant, Sherman and Sheridan, Governor Foster and many of the officers and soldiers who served with General McPherson will be present. Ex-President Hayes will preside over the ceremonies, which will consist of a military and civic parade, a formal address and several shorter speeches.

Sir Edward Thornton, British Minister to the United States, accompanied by Mr. Blaine, presented his letters of recall to President Garfield on the 9th. Mutual assurances of distinguished consideration were given.

Is the American played out? At the examinations at Yale College last week all the honors were carried off by foreigners. A Jew had the best college record, a Dutchman was second, while a Chinaman, Mr. Chung, won the prize in declamation.

Mr. Walker Blaine, son of Secretary Blaine, entered upon his duties as Third Assistant Secretary of State on Thursday.

The number of failures during the first six months of 1881 was 2,497, involving $40,000,000, or $7,000,000 more than in the corresponding period last year.

Three presidents of the United States have died in office, Harrison and Taylor died natural deaths. Lincoln was assassinated. Three vice presidents have become presidents by the deaths of the presidents with whom they were elected. These were John Tyler, elected with William H. Harrison in 1840; Millard Fillmore, elected with Zachary Taylor in 1848; and Andrew Johnson, elected with Abraham Lincoln in 1864.

Chicago is to have an Inter-State Industrial Exposition, commencing September 7th and holding until October 22.

The household goods and personal effects of the late Vice-President Wilson, were sold at Natick, Mass., last Friday. There was a good attendance, but poor bidding. The highest price brought by any one article was $29 for a $100 carriage-robe. Grant's picture sold for fifteen cents; Horace Mann's pocket-knife, $1.50; the manuscript of Wilson's lecture on slavery, $3, and an autograph letter, with the signatures of more than two hundred famous people, $4.50.

A new fiscal year having begun the Treasury officers are casting up their accounts. One of the most significant facts is that although the ordinary expenses of the Government last year were $8,000,000 more than the preceding year, the expenditures show a reduction of $3,000,000 in favor of the closing year, owing to a saving of $11,000,000 in the annual interest charge.

Fire has made great ravages in the forests of the county Lathbintere, Quebec, the last few days. At Narcisse several buildings were burned. At Stagapit five houses and barns were burnt; three at St. Sylvester. The fire destroyed some standing grain.

At Washington, it is suggested that in case the President recovers there should be a national celebration to give expression to the popular feeling.

H. E. Wilson, assistant to Prof. Stone at the Cincinnati Observatory, while observing the comet saw its nucleus separate and form two separate nuclei. Prof. Stone says the two parts are 1,200 miles apart.

"Victory!"

Under this caption, a gentleman in Iowa, who had procured the Compound Oxygen Treatment for his wife, writes: *I am surprised at finding her so much improved in health.* When she began using the Oxygen she could not sit up more than four hours at a time. Could not walk a quarter of a mile. Improved from the first inhalation, and now, having used the treatment for six weeks, does considerable work around the house, and *can walk two miles and not be tired.* Raises no more bloody matter. No cough. Sleeps and eats well. All that I can say is, 'Thank God and Drs. Starkey & Palen.'" Our Treatise on Compound Oxygen, its Nature, Action, and Results, *sent free.* DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

France imported of beeves, cows and calves, 54,000 in 1879; 56,000 in 1880; and 31,000 hitherto in 1881.....The maker of an artificial rose in London deceived a number of practical rose culturists..... ....A Parliamentary return, entitled "Evictions (Ireland)," shows that during the quarter ended March 31, there were 1,732 persons evicted of whom 181 were readmitted as tenants, and 737 as care-takers.....Official returns show how vast are the flocks of sheep owned in the Australian colonies: The New Zealand and Australian Land Company owns 300,000 sheep; Mr. Robert Campbell, 386,000; Mr. George Henry Moore, 90,000; Messrs. Daigetty & Co., 208,000; Sir Dillon Bell, 82,000; the Hon. William Robinson, 68,000; Sir Cracroft Wilson, 40,000; Mr. Kitchen, 80,000, and Mr. Allan McDean, 500,000.....In a communication to the Montreal Witness, Mr. Henry G. Vennor, on the 4th inst., gave some more of his weather predictions, as follows: "While here we are upon the verge of excessive heat and storms of wind, hail and lightning—England and Ireland are likely to be swept by heavy rain storms and general electrical disturbances. After the 25th day I expect, on this side, a cool to cold wave with further storms, and in sections Fall-like weather."....The Ohio State Board of Agriculture, under date of July 7th, furnishes the following, based on reports from over 1,000 correspondents, relative to the percentages of the condition and prospects of crops compared with July 1, 1880: Wheat, 77; rye, 86; oats, 94; corn, 76; timothy, 92; clover hay, 101; red-top, etc. 87; Hungarian, 92; potatoes, 86; tobacco, 87; apples, 39; pears, 62; peaches, 43; plums, 55; grapes, 72. The wheat prospects on May 1 were reported at 85. The loss is due to the May drought and to the Hessian fly. Much of the wheat is thin on the ground, but has long heads and plump berries. Nearly the entire crop of wheat for Ohio has been secured in good weather and is in good condition. Seventy-seven per cent. of last year's crop of 52,000,000 bushels as estimated, would be 40,000,000 bushels.....The Mark Lane Express, (England), under date of July 4, in its review of the grain trade of the past week says:—"The weather has been uninterruptedly fine. Wheat has passed through the critical blossoming period favorably. The general condition of the crop appears to be healthier, although the plant is thin on the ground and stunted in growth. Barley—appearances indicate a good crop on the best land, and variable elsewhere. Oats—prospects bad and this crop appears to be the worst..... A cablegram from St. Petersburg on July 4, says the harvest is expected to be very good throughout the Empire..... New Zealand rejoices on the safe arrival of two fertile humble-bee queens out of eighteen shipped from Scotland. They were caught and sent on ice in a torpid state, and this is the first successful one out of many attempts to import them. Hitherto red clover could not thrive there, as it could not be fertilized, but the long probosces of the humble-bees will effect this object..... ....In 1878 the hay crop of Maine was valued at $12,348,000, while the total value of the crops of corn, wheat, rye, oats, barley, buckwheat, and potatoes was only $6,598,167, or about one-half what the hay crop was worth. In Massachusetts the hay crop was valued at $11,497,850, while the total value of the crops of corn, wheat, rye, oats, barley, buckwheat, potatoes, and tobacco was only $8,695,838, or less than one-third the value of the hay crop. The other New England States show about the same relation as regards the value of the hay crop compared with that of the other farm crops.....Chili has taken possession of the Lobos guano islands, and has already sold 50,000 tons of guano at $35 a ton to English capitalists.....Maud S. trotted near Detroit last Monday, making the mile in 2:13¾, beating St. Julien's time of 2:16¼ ..... One of the largest grain elevators in the world has just been completed across the East River, near South Ferry, Brooklyn. It has a storage capacity of 2,500,000 bushels, and superior transfer facilities and dockage for half-a-dozen vessels, all of which can be loaded at one time. It took over a year to build it, and it cost nearly $2,000,000.....According to a statement just issued by Ex-Commissioner Le Duc, the record of matter printed by him is as follows:—Printed pages, including bound volumes, special issues, and miscellaneous circulars, 858,381,675; packages of seeds distributed by him 4,432,828; valuable plants, 673,822; botanical specimens, 17,500.....France prohibits the importation of tobacco, raw or manufactured. England will not allow her own farmers to grow it..... The most profitable English crop recorded this year is reported in Land (London) to have been harvested on a sandy farm of sixty acres in the Eastern Counties. The crop has already been sold for £2,000—$10,000. It consisted of pheasant's eggs, which sell at from 1s. to 1s. 6d. each—24c to 32c. ....New South Wales has 35,000,000 sheep, and a population of 750,000, according to the census just taken. Fat cattle were selling low there at date of last advices—April 23—and store cattle were unsalable. Late rains had broken up a severe drought and all were hopeful of carrying stock safely through winter whose approach was already announced by several light frosts..... Fall-sown grain was already up in Victoria and promising well—barring injury from frost..... From Adelaide, South Australia, comes news of drought, with occasional light showers—population 277,000. Crop news fair from New Zealand—population of colony 489,561 on April 3d..... At Cape Colony May 2, all crop reports good.....

Kern county, Cal., reports an immense crop of grapes. Frost hurt the apricots and peaches..... ....There are 2,000 acres of flax within 15 miles of Santa Barbara, Cal. A fine yield is certain..... The hop crop of the Williamette Valley, Cal., will not amount to more than one-half, where the yards were overflowed by the floods of the past Winter.....Fresno peaches are being shipped to the San Francisco market this year for the first time. Fresno folks claim to grow the best peaches in California....., In Yolo County, Cal., crops are going to be moderate. A few farmers have concluded to pasture the whole of their farms and give the land a rest.....Some remarkable statistics with reference to New Zealand have been contributed to an English contemporary. In the single province of Canterbury agriculture has developed in a truly marvelous manner during a brief period. In 1876 the production of wheat there was 1,770,363 bushels; of oats, 2,888,683 bushels; of barley, 620,699 bushels; and of potatoes 17,895 tons, the total acreage under cultivation being 152,982. Last year the acreage had increased to 359,729, the products being 6,461,400 bushels of wheat, 7,776,275 of oats, 1,124,281 of barley, and 37,466 tons of potatoes. Similarly with regard to sheep raising. It is said that there are in New Zealand at this moment 12,000,000 sheep; a hundred years ago there were twenty-nine..... There will be no meeting of the New York Horticultural Society in July, and none in August unless notice thereof shall be previously given. Experience has proved that meetings in these two months are very poorly attended.....

The great St. Louis Fair will give liberal premiums for Short-horn, Hereford, Devon, Polled Angus, Polled Galloway, Jersey, Holstein and Ayrshire cattle. Polled Norfolks will also be admitted. The following are the premiums offered for each breed.

BULLS.

Best bull 3 years old or over	$100
Second premium	50
Best bull 2 years old and under 3	50
Second premium	25
Best bull 1 year old and under 2	25
Second premium	15
Bull calf under 1 year	10
Second premium	5

COWS.

Best cow 4 years old and over	$100
Second premium	50
Best cow 3 years old and under 4	50
Second premium	25
Best heifer 2 years old and under 3	30
Second premium	15
Best heifer 1 year and under 2	
Second premium	10
Best calf under 1 year and over 6 months	10
Best heifer calf under 6 months	10

SWEEPSTAKES.

Best bull of any age	$100
Best cow or heifer any age	100

HERD PREMIUMS.

Best herd comprising 1 bull and 5 cows or heifers over 2 years of age owned by exhibitor	$125
Second premium	75
Best young herd comprising 1 bull and 5 heifers under 2 years of age owned by exhibitor	$100
Second premium	50

These premiums, our readers will distinctly understand, are open to each one of the seven breeds named above.

No barren animal will be allowed to compete in breeding classes, and in all cases satisfactory evidence by affidavit or otherwise must be furnished that the animal has been and is a breeder, if not it will be excluded from competition.

No bull over one year old will be allowed *on the grounds* without a ring in his nose, or be led through the grounds for exhibition without a staff.

The scale of points made by the American Jersey Cattle Club will be used in judging of the merits of all Jersey cattle entered for exhibition.

Other than these the rules of last year will be adopted.

A comparison of the receipts of breadstuffs at the port of New York during the first six months in each year of the last two year's results thus:

	1880.	1881.
Flour, barrels	2,145,200	2,632,306
Corn-meal, barrels	62,600	100,600
Wheat, bushels	22,573,000	20,208,400
Corn, bushels	26,276,200	20,360,350
Rye, bushels	536,750	541,500
Barley and malt, bushels	2,733,700	2,596,600
Peas, bushels	301,300	140,000

And of the exports hence, same time, thus:

	1880.	1881.
Flour, barrels	1,939,100	2,632,850
Corn-meal, barrels	82,100	106,300
Wheat, bushels	28,283,350	22,316,300
Corn, "	22,468,600	15,809,000
Rye, "	943,650	668,000
Barley, "	262,636	15,100
Oats, "	282,250	80,900
Peas, "	204,500	159,400

Cows as well as deer, sometimes lock horns. The Blakely (Ga.) News records a recent case. The cows had been missing ten days and were found in a miserable plight. The horns had to be sawed. .....The Swiss colony recently established at "Bernstadt," Laurel County, Ky., is receiving new accessions almost weekly, and seems to be prospering finely. They have bought a large tract of land, and are, so far, highly pleased with their prospects.

The appended tables give the percentage of wheat imports into Great Britain and Ireland from the United States, Russia and Germany during the two past decades:

Calendar year.	Percentage of imports from— United States.	Germany.	Russia.
1861	36.6	21.1	15 2
1862	39.3	18 5	14.1
1863	35.7	21.7	18.6
1864	34.0	27.4	22.1
1865	5 6	32 6	38.5
1866	2.7	26.9	38.6
1867	12.1	20.5	40.5
1868	18.1	18 5	30.8
1869	35.0	16.3	24.3
1870	40.0	10.8	33.2
Total for decade ending 1870	27.1	20.5	26.9
1871	34.0	7.74	39.7
1872	21.0	9.24	42.4
1873	45.1	4.91	21.8
1874	55.6	7 38	13.8
1875	45 3	10.8	19.3
1876	43.4	5.22	19.8
1877	39.3	10.1	20.0
1878	58 2	10 3	18.1
1879	60.6	6.9	13.4
1880	65.4	2.91	5 22
Total for decade ending 1880	47.8	7.45	20.4

The latest accounts of the Rugby colony, in Tennessee, differ as to the probable failure or success of the enterprise, some making it appear that the colonists cannot much longer be kept together while other speak very highly of its condition and

THE RURAL'S NEXT

Free Plant and Seed Distribution will Surpass all Others!

See the FAIR NUMBER of the Rural New-Yorker, which will be Published Sept. 15. Specimens Free.

prospects.....Bermuda is esteemed by its inhabtants as the Madeira of America. The chief products of the islands are arrowroot, potatoes, onions and tomatoes, nine-tenths of which go to the United States. The total values of the crops exported amount to about $300,000 annually. As there are less than 3,000 acres of land under cultivation, this return is undeniably great, and shows the wonderful fertility of soil. A lack of public spirit is characteristic of the inhabitants or Bermuda islands and prevents them from holding the position that their natural resources should command for them.....

People Should

Purify the blood by cleansing the system of foul humors, and by giving strength to the liver, kidneys and bowels, to perform their regular functions. Kidney-Wort will do it. This remedy is now prepared in liquid as well as in dry form.—Inter-Ocean.

Lydia E. Pinkham's Vegetable Compound is a remarkable remedy for all those painful complaints and weaknesses so common to our best female population. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

Kidney and urinary trouble is universal, and the only safe and sure cure is Hop Bitters—rely on it.

BURNETT'S COCOAINE.

Promotes the Growth of the Hair,

And renders it dark and glossy. It holds, in a liquid form, a large proportion of deodorized COCOANUT OIL, prepared expressly for this purpose. No other compound possesses the peculiar properties which so exactly suit the various conditions of the human hair.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, July 9.

Chicago.—WHEAT active. No 2 Chicago Spring. $1.08⅞@1.09¼, cash; $1.08⅞@1.09, July; $1.10⅞@1.11 August; $1.09⅝. September; sales at $1.10⅝@1.11⅝ August; $1 09⅝@1.10, September; No. 3 do, 97c.@$1.03; Rejected 76c@82½c. CORN steady, with a fair demand, at 46c@46½c., cash and August; 46⅛c @46¾c., September; 46⅜@46⅞c., October; sales at 46c@46¼c. August. OATS dull 38¾c., cash; 38¾c@38⅞c. July; 28c. August; 26¼c September. BUTTER.—Fair to choice creamery 18@22c. per pound; good to fancy fresh-made dairies at 14@17c, medium to fair do. at 10@12c; common and old do at 8@9c; good to choice fresh ladle-packed at 14@15½c, and fair to the best packing stock at 11@13c. CHEESE.—Good to fine cheddar creams at 8@8¾c per lb. while the part skim cheddars were quoted at 6@7c. and the skim flats at 5@6c. or as to condition. Poor and old goods nominal. EGGS.—A dull heavy market is noted under large offerings and a slow demand. Sales dragged at 13@13½c. per doz and buyers demanded a full guarantee. BEESWAX.—Good to choice bright is quoted at 20@23c. per lc. and common dark-colored lots at about 15@18c. HONEY.—There was nothing doing in this market worth mentioning. Good to choice comb was quotable at 12@15c, per lb and common at 7@10c. POTATOES.—Sales from store were quite free, and the offerings were ample. Salable at $3@3.50 per bbl. for good to choice large new, in a jobbing way, with the usual premium asked for small lots. HOGS—Mixed packing slow at $5 90@$6 30; light, active and 5c. higher than on Friday at $6 35@6 45 for good and $6 05@6 20 for common; choice heavy, $6 35@6 65; Culls and light Yorkers. $5@5 90. CATTLE—good to choice shipping, $5 65@$6; common to fair, $4 90@5 45; exporters, $6@$6 25; butchers', $2@4 25; shipping Texans strong at $4 35@4 60; canning weak at $3 10@3 75; native stockers and feeders very dull and weak at $2 50@$4 50. SHEEP—market steady; common to medium. $3 25@4 40; good to choice, $4 60@6 20. WOOL—The movement continues rather slow, though trade cannot be called dull, as sales are constantly being made of small lots and prices are quotably firm. The current quotations from store range as follows for bright wools from Wisconsin, Illinois, Michigan and eastern Iowa—dark western lots generally ranging at 2@5c. ₩ lb less:—Coarse or dingy tub, 33@36 ₩ lb; Good medium tub, 37@42; Fine unwashed bucks' fleeces, 13@15; Fine unwashed heavy fleeces, 20@23; Fine light fleeces, 23@25; Coarse unwashed fleeces, 18@22; Low medium, 23@25; Fine medium, 27@29; Fine washed fleeces, 34@36; Coarse washed fleeces, 32@34; Low medium fleeces, 35@38; Fine medium fleeces, 38@40; Colorado and territory wools range as follows: Lowest grades, 14@22; Best grades, 22@28; New Mexican unimproved grades 14@18; New Mexican best grades, 22@24; Burry from 2@10c ₩ lb off; black 2@5c off.

St. Louis.—WHEAT higher; No. 2 Red Fall $1 14¾ @1.15, cash; $1.13⅞@1.14, July; $1.14¾@1.14⅝, August; $1.12¾@1.13, September; $1.13¾@1 13¾, October; $1 11¾@1.12¾, all the year; No. 3 do., $1.08; No. 4 do., $1.03¾@1.04¾. CORN 44¾@45c., cash; 45½c., July; 45¾@46c., August; 46½c., September; 41¾@42c. all the year. OATS higher for cash; options lower; 36@37½c., cash; 34@34¾c. July; 26¾@26¾c., August. RYE slow at 96c. bid. PORK firm at $17.25. Bulkmeats steady; Shoulders 6¾c.; Clear Rib, $8.85; Clear Sides, $9.10. Bacon strong; Shoulders, 7¼c.; Clear Rib, 9¼c.; Clear Sides, 10c. Lard dull and nominal at $11.60. BUTTER — Creamery, 20@21c.; Dairy, 15@16c. for choice to 15@15c. for selections, medium 12@14c., low 8@9c.; Country in pails—sour-milky, light-colored, etc., 7¾@8¾c.; fair yellow 9@10c.; choice (in small quantities) 11@12c. CHEESE: Lots—full cream 9@10c.; prime part skim 6¼@7c.; poorer grades 5¼@6c.; hard skim 1¾@3c. CASTOR BEANS steady; in demand at $1 35 for prime in car lots. HEMP SEED in demand at $1 for dirty to $1 10@1.12½ for prime clean. POTATOES, new, in barrels, choice large, $3@3.40; inferior and damaged, $1@2.50—lots not well packed 25c. ₩ bbl. less; in bulk, 80@95c. ₩ bush.

POTATOES.—Old little done; season about over. Sound stock worth 75c to 85c. ONIONS.—Steady, the light receipts meeting ready sale sound nearby-growth $1.25 per bushel and $3.50@4 per bbl. Hogs active; Yorkers, $6 30@6.40; mixed packing, $6@6.30 choice to fancy heavy, $6.30@6 50. Cattle Supply light and altogether of grass Texans, which ranged from $3@4 25 native Heifers, $4 25; fat native Steers wanted at strong prices. Sheep nothing done; demand urgent. WOOL.—Offering fair in amount, and movement quite free—latter is due in no small degree to comparatively low freight rates ruling: Tub-washed—choice at 40@40½c, dingy and low 31@35c; Unwashed prime to choice medium 24c@25½c., fair do 23½@23½c., low and coarse 19c. to 23c. light fine 18@20c, heavy do. 14@17c. Black, cotted, burry and lots containing dung-locks, range from 3@10c. per lb. less than fleeces in good condition: Southern burry 11 to 13c.—for each wool sack, 3½ lbs are deducted and 25c. allowed.

PRODUCE AND PROVISIONS

NEW YORK, Saturday, July 9, 1881.

BEANS AND PEAS.—A good export call for medium beans: some West Indian shippers paying $2.45 for marrows The home trade has been replenishing to a fair degree in medium and they close quite firm for a warm weather term Black beans are a glut. The best outlet, a South American point, promises to be cut off by the imposition of heavy duties. Red kidneys very quiet. Green peas quiet; prime quality held as before, $1.50@1 55; off grades neglected. Southern B E. peas show the remnant of the crop and few are prime enough to bring $3@7.10 ₩ 2 bu. bag.

Marrow beans, prime, $2.43½@3.45; other, $3.25@2.35; medium, prime, $2.40; other, $2.20@2.35; pea, $2.30@2.40. white kidney, $2.25@2.45; red kidney, prime, $1.55@1.60; fair to good, $1.40@1.50; black or turtle soup, $1.30@1.35.

Receipts for week, 5,728 bush.

Exports do. 173 pkgs.

BEESWAX—Parcels of shipping importance quoted at 23@25c. Odd lots shaded from those figures.

BUTTER.—Considering the broken week the market has held up well, receiving a good deal of support from English shippers. Supplies have not been oppressive; receipts will probably enlarge next week but dealers do not expect a severe break in prices if the local trade keeps its present pace and quality of butter retains its good uniformity.

Creamery—Western, good to prime, 23c.; State and Penn. 22½@24c.; poor, 21c.; sweet cream, 23@23½c.; State pails and half tubs, choice, 21@22c; fair to prime, 19@21c.; Welsh tubs, 19@21c.; poor State, 16@18c.; firkins yellow, 20@22c; Western imitation creamery, 16@20c.; dairy tubs 19@20c.; other, 15@18c.; factory or ladle-packed, best, 15@16c.; other, 11@14c.; very poor Western, 10@12c. Some marks of down factory, 17@17½c.

Receipts for week, 39,990 pkgs.

Exports for week, 11,712 do.

CHEESE.—Trade has had an active run regardless of the shortened week, and in the effort to obtain high quality stock colored and white prices have advanced. Supplies will probably be heavier next week and sellers look for a tamer market. Still all seem satisfied with the good support that has attended the recent heavy Summer receipts.

State fact'y, choice, colored, 10¾@10¾c. do. white, 10@10¼c.; fair to prime, 8¾@9¾c; poor to fair, 8½@8¾c.; Ohios, flat, fine 9@9½c; other 6@8c Wisconsin poor to fine 8@9¼c.; part skimmed, 5@7½c.; full skims, 2@4c.

Receipts for week, 87,625 boxes.

Exports for week, 102,625 boxes.

Liverpool cable, 53s.

Steam to Liverpool, 25s. 6d@27s. 6d.

COTTON.—Though the week has been broken by a long holiday, a very fair business may be noticed with some advance in quotations. A strong Liverpool market has helped spot cotton and home spinners seem in want of steady supplies.

The close of the market was officially reported as follows: July, 11.13@11.15c.; August $11.18@11.19c.; September, $10.79@10.80c.; October, 10.33@10.34c.; November, 10.19@10.20c.; December, 10.21c.; January, 10.32@10.33c.; February, 10.44@10.46c.; March, 10.57@10.59c. April 10.68@10.71.

DRIED FRUITS.—The supply of evaporated apples is light and some speculative demand has appeared. Sales for use very light. Sun-dried apples held with confidence. Peaches small but quiet with high prices. Small fruits not moving but prime are quoted full. Cherries show a good deal of strength as the crop of new is thought to be light. Samples of new offered at 15c.

Apples evaporated choice 8¾@9c; fair to prime 7¾ @8¼c North Carolina sliced, common to best 6@5c. Va. do. 3¾@4c; Tenn in bbls. 4@4½c. do bags 3½@4c; State fine cut 4@4¼c., quarters 4½@4½c; Western, 3¾@4c; evaporated peaches peeled 25@28c.; unpeeled 13@14c. sun-dried peeled 17@20c; unpeeled halves 5@5¾c. Plums 10@11c. Blackberries 8c. Cherries 13@14c. Raspberries 24c. Whortleberries 11@11½c.

In drying by a good process a bushel of raspberries should turn out 11 lbs.

Receipts for the week, all kinds, 412 pkgs.

Exports dried apples, 2,420 pkgs.

EGGS—Receipts for week, 6,837 bbls.; do. last week 10,252 do. Small supplies have given holders some independence and prices are quoted firm at the advance for strictly fresh. Ice house parcels are turning our poor. It pays at this point of the season to carefully sort and pack even if it involves frequent shipments.

Near points, 15½; State and Pa., 17@17½c.; Western, fresh, 15@16½c.; Canadian, 16¾@17c.; poor lots, 13¾@14½c.

FLOUR.—There has been no violent decline in prices, though the wheat crop reports have had some depressing effect of brief duration. The high grades and established brands may be said to close quite steady. There is a marked falling off in exports for continental use.

No. 2. ₩ bbl., $3.00@3 65; State and Western superfine, $4.00@4 40; city mills extra, $6.25@6 50; Spring wheat do. $4.80@5.10, Spring XX and XXX, $5.25@7.00; patents, $6.50@8 50; Ohio round hoop shipping, $4.80@5.20; trade brands, $5.40@6.25; St. Louis extra, $4.90@5.50; do. double extra, $5.75@6.25; do. family, $6.40@7.25; South'n shipping, $5.35@5.85; do. GRAIN.—A fair export demand is about the only solid feature of the trade this week. Sales for this purpose mostly Spring. Corn has arrived heavily much of it is destined to fill up contracts. The exportation is behind this date last year in quantity and the market evidently feels the over-weight. A strong effort to sell oats, which have arrived very liberally, has kept prices in buyers' favor: the market however closes a little stronger for owners. Rye has ruled dull. The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail, on lakes, on canals and on Mississippi River:

	1881. July 2. bush.	1880. July 3. bush.	1879. July 5. bush.

Receipts for week, wheat, bush., 1,293,698; corn, do 205,325; oats do. 489,100; rye, do. 2,400; malt, do. 87,868; rice pkgs. 509.

Exports for week, wheat, bush 55,312; corn, do. 1,139,125; oats, do. 3,072; rice, pkgs., 60.

HAY AND STRAW.—Exports for week 1,022 bales. The market is severely over stocked with hay and new will have to start pretty low. Buyers will not take much above regular wants while quality is so low. Shipping and car-stable grades in fair demand with prices favoring buyers. Straw easy.

Choice retailing timothy hay 80@85c. ₩ 100 lbs.; second quality, 60@70c, do.; shipping 45@50c. do.; clover mixed 50@55c; pure 35@40c: Long rye straw 75@80c; short do. 50@55c.; do. other grain, 45@50c. do.

HOPS.—Sales are confined to a small brewing demand. Exporters almost out of the market as it is impossible to fill a good sized order with choice quality. State crop advices at the movement not favorable.

Crop of '80 choice, 20@22c; good to prime 16@19c; fair to good, 13@15c; poor to fair, 11@13c; Eastern, 11@18c.; '79's, fair to prime, 12@15c.; olds, 5@8c. Wis, 14@22c.; Cal and Oregon 19@23c.

Receipts for week, 613 bales.

Exports for week, 301 bales

MILK.—Supplies have been under better control as the weather has favored enlarged use. The average was quoted $1.24½ per can of 40 qts.; range of prices 90c@$1.50, closing at $1.30. Farmers' price for contract milk for June 1½@2c. Commission milk hardly made freight.

RICE.—Carolina 5@7¾c; La. 5¼@6¼c.

SUGAR —Refined quoted:

Hard sugars—crushed ₩ lb 10¾c; do. powdered 10¾c do granulated 10¼@10¼c; do. cut loaf 10¾c; confectioners' "A" 9¾@9¾c; coffee "A" standard 9¼@9¾c do. off "A" 9¼@9¾c white extra "C" 8¾c; extra "C" 8¼@8¾c; "C" 7¾@8¼c; yellow 7¾@7¾c.

TOBACCO.—Kentucky promises a good average crop. There is no new feature in the market; prices seem established for the moment.

VEGETABLES.—Potatoes are in large supply and with L. I down to $1.25@1.50 other sorts are weak, A few Mo. rate $1.75@1 60, but other Southern range 75c@$1.25 with culls at 50c Garden stuff has an early exhibition of novelties.

Green corn, Burlington ₩ 100 $1.50@1.75; Green peas, L. I., ₩ bag, 50@75c; wax beans 50@75c, string beans 50@75c. Jersey ₩ bbl. $1@1.05; cucumbers L. I. ₩ 100 $1@1.25 Norfolk, ₩ bu. crate, 50@75c, egg plant Fla. $1@2. Tomatoes Jersey ₩ basket $2.50@2.75; Norfk. ₩ bu. crate $1.25@1.75; Cuba & Sav. $1@1.50; squash Norfk marrow ₩ bbl. 75@$1; L. I. ₩ 100, bchs $1.00; onions, Southern yellow ₩ bbl. $3@3.25; Bermuda ₩ crate, 15@50c; lettuce ₩ bbl. 50@75c; asparagus, Oyster Bay ₩ doz., $1.75; carrots $ 100 bchs $1@1.50; radishes 50@75c; rhubarb L. I & Jersey 75c.@$1; white turnips Jersey $1.50@3; turnips Russia ₩ bbl. 75@85c.; cauliflower, Jersey & L. I. ₩ bbl. 1@3.

POULTRY AND GAME—Supplies of dressed are moderate and prices are doing well, good quality especially in chickens helping sales.

Turkeys, Phila. choice ₩ lb 12@13c.; State & West. 12@13c. Phila Spring chickens 25@28c; New Jersey 24@26c; West. 21@23c. fowls, Phila. d. p. 16c.; N. J. d.p. 15 do. scalded 13½@14½c.; State and Western 13@14c; do. d.-p. 13½@14½c.; coarse 13@14½c.; Ducks—Spring, 14@20c.; old. 13@15c. Squabs, white, ₩ doz. $2.50 do. dark, $1.50@1.75

Live chickens active, sizes more attractive. Fowls are scarce and have been well used up. Geese quiet. Ducks in good demand with a highly supplied game market.

Spring chickens prime ₩ lb 21@22c.; other 19@20c. Fowls, ₩ lb. 13@14c; roosters, 7@8c.; turkeys, 11@12c.; ducks, ₩ pair 60@80; geese, extra $1.75; other $1@$1.50. pigeons, 25@40c.

There are few items and even these are not daily quotable. Wild pigeons $2.25 ₩ doz. Squab $1.75; Eng. snipe, $2.25; Plover, $2@2.25

PROVISIONS.—A strong speculative interest is again operating, and the market is in a feverish, unwholesome condition. The chief feature is in lard, but prices have run up to a point that restricts exportation. Lard may be said to hold the controlling interest, in hog products, taking the place formerly filled by bbl. pork.

Pork, extra prime, $14@14.50; Western mess, new, $17@17 25; old, $16.25@16 63. Lard, steam Western ₩ 100 lbs, $12@12.10; prime city, $11 50. Hams, smoked city, 11¾@12¾; pickled Western, 10¾@11¾; Shoulders smoked city, 8¾@8¾ pickled, 7¾@7¾; rib bellies, pickled, 9@9¾. Bacon, long clear Western, 9¾. Beef mess, bbl., 10@12c; India mess, tcs., 22@24c; beef hams, bbls. $23@23.50.

Receipts for week—Beef, bbls and tcs 715; pork, bbls, 3,250; Cut meats, pkgs. 14,725; lard, do 15,800. Exports—Beef, bbls and tcs. 1,475; pork, 2,900; cut meats lbs. 3,662,257; lard, 1,731,640. The estimated packing of hogs at the West from March 1st to June 29th 3,045,000, a decrease of 685,000 compared with the same period 1880.

WOOL.—The market still holds its high bearing; all points report a strong demand for the new clip. There is no further advance but full and steady prices are named with active trade. Growers are having a good participation in the profits of a buoyant market this season

Ohio, Penn. and W. Va. XXX and picklock, 43@45c.; X to XX, 40@43c.; No. 2 to No. 1, 40@45c. coarse, 31@38c. combing 40 215.

State and Western X and XX, 39@41c.; No. 2 to No. 1 38@41c.; coarse 32@38c.; combing, 40@44c.; combing unwashed 32@34c.

Spring northern, free, 34@37c.; middle counties, free, 28@32c.; southern, 22@27c.; low grade and burry, 20@23c. Full, low grade and burry 16@21c. Texas—choice, free, 28@32c.; fair to good, 24@26c.; low grade and burry 17@20c. Pulled super 38@42c.; extra 35@38c; No. 1, 20@22c combing, 35@40c.; lambs 38@40c. Tub washed, fair to choice, 35@44c.

LIVE STOCK MARKETS

NEW YORK, Saturday July 9, 1881.

BEEVES.—Receipts for the week 11,414 head; do last week 12,530 do. Small supplies gave sellers a decided advantage and with quick pen-clearing sales the market advanced ½c. on medium to good cattle and ¼c. on other grades compared with Wednesday's market. Larger supplies are due next week, but it is thought that the new quotations will be sustained in the early business of next week. The market closed strong and buoyant. Twenty cars of Light Thin Grass Cherokees were sold at 8¼@8¾c; 7 cars of Colorados at 9½@9¾c. Small light Kentucky Stillers were sold at 10½@10¾c, and 4 cars of Good Cincinnati Stillers changed hands to 12c. to dress 56 lb, less 50c. ₩ head. There were no very low priced Native corn-fed cattle on sale, and the range from 11 to 12c covers nine-tenths of the sales. One drover ran out 3 car-loads at 12c to dress 57 lb, and 5 head at 12½c. to dress 57 lb. Dispatches were sent out immediately after the close of the market to have the cattle which are on the road crowded forward with all possible haste Twenty-five car loads are expected at Sixtieth street yards to-morrow.

MILCH COWS.—Receipts are moderate; common cows not wanted and barely make last rates. Prime to extra milkers rather firmer. The full range is $30@55 ₩ head. Part of a car-load of State brought $45@65 each.

VEAL CALVES.—Sales have been quick at good figures—nothing left over.

Live N. J. prime to choice, 7¾@8c do. state, 7¼@7¾c.; poor to good 5½@7c.; Mt. Hollys 6½@8c.; buttermilk, 3½@4c.; up-river, dressed, 10@12c.

SHEEP AND LAMBS.—Receipts for the week 23,901 head do. last week, 26,237 do. The demand was good and stocks sold readily at rather stronger prices than were current yesterday A bunch of Virginia culls sold at 3½c and some small lots of ewes at 4@4¼c. but fair sheep brought 5@5¾c, and choice export wethers could have been sold at 6@6¼ A few Western cull lambs sold at 5c. otherwise the sales of Va. and Ky. lambs were at 7¼@8c. with State Penn. and N. J. 8@9c.

SWINE.—Receipts for the week —— head; do. last week 23,253 do. The market has been quite bare of live as no shipments left Chicago or St. Louis on the 4th. Corn fed hogs named at 6¼@6½c City dressed State 8¼@9; do. Western 8¼@8¾c. Good demand for nice thin pork.

AN OFFER

—TO—

CONSUMERS

—OF—

TEA & COFFEE.

We have made a specialty during the past four years of GIVING AWAY as PREMIUMS, to those who get up CLUBS for our Teas, DINNER SETS GOLD BAND TEA SETS, SILVER-PLATED WARE, and other articles both useful and ornamental.

We import and buy direct from manufacturers all the goods we handle, and own them at the *lowest possible price* cash will purchase. During the past four years we have sent from our store over 12,000 of these orders, and they have gone into almost every State in the Union.

We keep in stock *every variety* of Tea known, and at all prices.

Oolong, Japan, Mixed, English Breakfast, Old and Young Hyson, Imperial, 50c., 75c., very finest $1. Gunpowder, Black Japan, Foochow 75c., $1. Orange Pekoe and Assam, 85c and $1.

Below are a few of the many Premiums offered:

With a $5 order we send a *Silver-Plated Caster.*

With a $10 order we send an *English China Tea Set of 45 pieces.*

With a $15 order we send a *Silver-Plated Caster, Pickle Dish and Butter Dish* or an *English China Decorated Tea Set of 44 pieces.*

With a $20 order we send a *French China Gold Band Tea Set of 44 pieces,* or an *English China Dinner Set of 106 pieces.*

We have *hundreds* of letters like the following:

LIME ROCK, Conn., April 30th, 1881.

Gentlemen—Please accept thanks for the beautiful Tea Set, which is much nicer than I expected, and indeed it is surprising to every one how you can do so much for so little. All are so well satisfied with the Tea that I think you will receive another order soon.

Yours truly, MRS. A. THORPE.

TAUNTON, Mass., March 8, 1881.

Gentlemen—I have forwarded eight different orders for Tea, and have received as premiums a tea set, a silver-plated caster, a dinner set, a glass set, a case of silver-plated knives and forks, a pair of French china fruit dishes, and *two ladies' gold watches*, and am now on my ninth order. Both Tea and premiums I am well pleased with, and have found perfect satisfaction with both. Yours truly,

MRS. MARIA C. LYNCH.

Orders, with P. O. Order, or money enclosed in registered letter can be sent at our risk. All checks or Post Office orders should be made payable to F. M. LINNELL.

We also send Teas by mail, without premium, postage paid, at list prices, to those who wish for choice goods and are so situated they cannot obtain them at home. For full price and premium list, send us postal, with address PLAINLY WRITTEN.

Reading for the Young.

DAISY'S YEAR IN SOUTHERN CALIFORNIA.

ALICE P. ADAMS.

The Climate.

It was early in May and Mr. Erman sat reading his evening paper, the Los Angeles Express. He looked up from the telegraphic dispatches with an exclamation. "Warm weather has commenced already," he said. "There was a case of sunstroke yesterday in New York."

"As soon as this!" exclaimed Violet. "Why it seems as if the last news we had from the East was that they were nearly frozen. And now comes the other extreme. For my part I don't see how people endure it to live in such a climate!" concluded the out-spoken young damsel.

"Yet we were comfortable there for a good many years, and never thought of anything better," said her mother, smiling.

"*Comfortable!*" repeated Violet. "Perhaps you would like to go back again and live in *comfort!*"

"No," said Mr. Erman, "I don't believe one of us would be contented to stay east of the Rocky Mountains for six months."

"I remember how warm it was last Summer," interposed Daisy. "We used to roll our bed between the windows to get all the air we could and never thought of lying down without a palm-leaf fan. Once Uncle John slept in the hammock every night for a whole week, for he said he couldn't breathe in the house. And in the morning we felt as tired as when we went to bed."

"You will find no weather like that in San Gabriel, my dear," said Mrs. Erman. "Instead of fans you will want blankets, just the same as you use now. No matter how warm it is during the day the evenings are cool, and you can take a good night's rest under warm covers, and wake up bright and fresh the next morning."

"People can endure more heat here than in the East," said Mr. Erman. "It does not seem so prostrating. I can work here in the sun all day, when with the mercury at the same hight in Illinois I should feel it a great exertion to walk down to the store. And three things to which you have been accustomed you will miss here—sunstrokes, thunder storms and mad dogs."

"Why don't they ever have sun-strokes here?" asked Daisy. "It must be queer kind of weather. I always thought that California Summers were hot, hotter, hottest! And no thunder-storms—mother would like that, as they always make her sick. But how do you know there are no mad dogs, Mr. Erman?"

"Well, I must confess I take the old settlers' words for it, though I have never heard of one since we came here. The dogs are never muzzled at any season of the year, and you have probably observed that they are by no means scarce, particularly in the Mexican families, where I believe the rule is one for each child."

"People do have the strangest ideas about California, anyway!" broke in Violet. "They talk about the 'heated term' as if we nearly burnt to cinders from May till November, and think that the wet season means a continual deluge from November till May. I'm out of patience with them!"

"As your stock in trade was never very large I don't wonder that you are unable to meet the pressing demands made upon it," remarked Bertram. "However, when Daisy returns she can enlighten her friends as to the climatic conditions of California, which will doubtless relieve you to some extent."

"You hateful boy!" cried Violet. "I've a great mind never to say anything more while you are around!"

"What a deprivation that would be to us all," replied her brother, with a woe-begone look.

"There, there, children," interposed Mrs. Erman, "Violet, never mind Bert's nonsense. And as to our young lady's outbreak, Daisy, it is certainly true that Eastern people generally have strange conceptions of our climate. The dry season has commenced. I presume we shall not see any rain till the latter part of October—possibly later; though twice we have had a little shower in July. But it does not follow that because we have no rain we must be uncomfortable six months of the year. The beautiful green hills and plains turn brown, it is true; already they are beginning to loose their freshness. And it is dusty—but we become accustomed to that, and hardly notice the dust as much as we did in Illinois, when we had a few weeks without rain. There is no difference about the yard and orchard, for the plants and trees are all irrigated, and grow as well as if they had the benefit of a shower every week. Most of our fruit comes at this season, and in spite of the dust and brown landscape many people, myself among them, prefer the Summer months."

"Did you remember what young Heller at Pasadena said when he first came here in the Summer?" asked Mr. Erman, laughing. "He thought it was the most desolate, forsaken country he had ever struck, and was so homesick that he would have left on the next train if he had not promised his brother that he would test the climate thoroughly."

"Yes, and do you suppose you could hire him to return now? I don't know a young man that is more enthusiastic about California."

"But I don't wonder that people coming here in the summer are often disappointed," continued Mr. Erman. "The State has been described in such glowing colors that it must be a shock to find that one can travel for miles without seeing a spear of grass, or particle of green vegetation, and the land looking so dry and barren that it seems incapable of producing anything. But I always say to dissatisfied new-comers, "Don't judge hastily. Wait a year before you make up your mind to leave the State."

"One peculiarity that strikes Eastern people is the amount of clothing worn. The climate being so mild one naturally concludes that only thin clothes will be required; but most people wear flannel the year round. You see we have a steady ocean breeze during the Summer which tempers the heat, and there is such a regular change between the day and night that we are obliged to dress more warmly than if the temperature after sunset was higher. And when we go out for a drive I never start without extra wraps unless I am *positively certain* that we shall be back early."

"Which means that you always carry them along," added Violet.

"And what about the rainy season?" asked Daisy.

"You came in March, dear child, so you know something of it yourself. The country puts on its green dress in November or December, and we have about the same weather that you enjoyed this Spring—with a trifle more rain. You will find that the grumblers rarely complain of too much rain. All the farmers, and especially those engaged in raising grain, rejoice when we have, what Bert calls, a regular soaker. People say that all weather signs fail here, but we are always pretty certain of one thing, and that is that we shall have unpleasant weather at Christmas. It has been so every year since we came except the first and that was a dry Winter—the hills were brown during the whole season."

"Speaking of rain reminds me of the consequence. Do you know what that is, Daisy?" asked Mr. Erman.

"Mud!" answered Daisy with a laugh.

"Correct. Now we have very little of that here. It is amazing how soon the roads dry up. No toiling through mud up to the hubs of your wheels I have yet to see the time when I cannot drive to town in comfort the next day after a heavy rain."

"That must be a blessing," said Daisy. "I know I have heard so much complaint about the mud at home. Do you ever have any colder weather than since I came?"

"Yes; sometimes we have frosts, but they have never injured us much," said Mr. Erman. "One morning when I got up it was 27° above zero. We all thought it terribly cold, didn't we, Violet?" he asked with a meaning side-glance.

"You complained as much as any one, papa Erman, so you needn't wink at me!"

"Well, well, we won't quarrel about it. The new growth on the trees was nipped, and my young lime hedge was cut nearly back to the ground. But we received no serious damage. A good many trees that stood on low ground, however, were killed. It is wonderful what a difference there is in the temperature of places but a short distance apart. There is Willow Dale only a mile from here, but it is sheltered by the hills, and protected from the frost. Then three or four miles east of us is a settlement that is low and damp; the grass grows in the streets in Summer, they do not irrigate, and have so much frost that they do not attempt growing orange trees, but devote their attention to grain and stock raising."

"Changing the subject," said Mrs. Erman, "people can live much cheaper here than in the East. Their clothes do not cost as much for they can wear the same garments Summer and Winter, if necessary, with but little change. They do not have such enormous bills to pay for fuel, and are not obliged to build such substantial houses. Now I prefer a plastered house; but if one hasn't the money he can live comfortably in a cottage made of boards set up on end, and simply papered on the inside. You will find thousands of these little houses, made of one thickness of boards, in California."

"One of the things that I like best about this climate," said Violet, "is that for six months in the year we are *sure* to have pleasant weather. There is no danger of being caught in a sudden shower. We can plan our picnics and entertainments weeks ahead, and be *certain* that when the appointed time comes round it will be a delightful day."

"And during the six months of the rainy season we are as confident of pleasant weather as our friends in the East ever are," added Mr. Erman.

NOTES BY UNCLE MARK.

I find, in looking over the Cousin's letters now, that several, which were written in the Winter and Spring, have been "crowded out," and consequently are now rather "out of season." But it shall be my purpose to publish those which may now come to hand, providing, of course, they are up to the standard, and of interest. Flowers, vegetables and fruits are now all nicely growing, and if any of the Cousins have anything interesting or novel to report, our columns are open to them.

Will "Carnation" please send me a specimen or two of the peculiar violet she mentioned in a recent letter to this department?

I am glad so many of the Cousins have applied for the Pyrethrum seeds, and I wish them success in cultivating them. There are a few packages left which may be applied for.

Another letter from our talented correspondent in Southern California is provided for our young readers, this week; and we imagine the older Cousins will find information in it, too. We hope to continue these interesting sketches at short intervals.

THE following letter is from the winner of the prize for drawings and is self-explanatory.

DEAR UNCLE—I received your very interesting present to-day, and think I am more than repaid for my work. I wish to express my obligation for the book, and I hope the drawings may prove serviceable. Yours respectfully,

C. A. BUTTERWORTH.

THE YOUNG QUERIST.

H. M. S., Bainbridge, Mich., asks if a letter addressed to "Uncle Mark, RURAL NEW-YORKER office," will be properly directed?

ANS.—Certainly. He is always on the lookout for a word from the Cousins.

V. A. H., Caldwell, Texas, would like the name, of the black insect which is injuring his grape-vines.

ANS.—So many insects infest the grape that we can hardly answer your question. If you will enclose some of the insects in a little box and send them to us we will give their name.

G. Q. N., Elmira, N. Y., wishes to know the entomological name of the currant measuring-worm.

ANS.—Abraxis ribearia.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—Is it a long time since I wrote to you last? I should not wonder, for you see I was a little disappointed that my letter met with such a sad, although not uncommon, fate; but since you say, "try, try again," I will not be discouraged. My garden was quite a success last year, and I enjoyed the care of it, but I am trying to do still better this season. The melons were very large and fine and received great praise. My seeds all grew well except the portulaca of which there was but one plant.

Now, with your permission, Uncle Mark, I would like to tell the cousins about our play-house, it was built last year for my brother, my sister and me. It is eight by ten feet and has a window on the south side and a door on the north. Last Summer we planted a Madeira vine beside the door, which ran to the top and hung down on the other side more than half way, and was covered with blossoms in the Fall. We also had Sweet Williams, gladioli and asters under the window. Our family consists of a number of dolls, a kitten whose name is Winnie and a little black and tan dog whose name is Tip. He keeps the hens away from the flowers, and we think a great deal of him. We have a little stove that Grandpa gave us, a table, a lounge, and some chairs. Our stove furniture consists of a frying-pan, and an iron pot just like the one that came over in the May Flower only very much smaller. We have a set of dishes and a nice cupboard to keep them in. We sometimes keep house in real fashion, and our little friends visit us, and we get tea for them the same as mamma does. Now Uncle Mark, if you or any of the cousins will visit us, we will welcome you most gladly, and will try and have a real nice time. Truly, your niece, ANNA.

DEAR UNCLE MARK:—Last Spring I spaded and planted my own garden, I bought 25 cents worth of garden seeds which I sowed with some I saved over from last year's seed distribution. Altogether there was enough for the piece of ground Pa gave me. I will let you know how I get along with my vegetables and flowers this Summer. We live near a small town where I can dispose of radishes, lettuce and onions, almost daily. I keep account of all I sell and will let you know what profit I make. I have sown a nice, big bed with cabbage seeds. I sell the plants for 25 cents per hundred. I want to tell you and the cousins that I have a fine little puppy, his name is Bonanza. I call him Bon for short—he is a real beauty.

Sylvania, O. WALTER GAYHART.

[A bright future may be predicted for you, Walter, if you continue as you have begun, in farming and gardening. Your father has, I think, solved the problem in your case, of "How to keep the boys on the farm," by giving you a plot of land for a garden and encouraging you to buy and sell and keep account of your transactions. U. M.]

DEAR UNCLE MARK:—My little sister and I wrote to you last Winter. One letter was in the RURAL in the Winter and one this Spring. We wanted very much to apply for seeds of the Pyrethrum roseum and would have taken great care of them, even if we had to build a house to protect them. My little sister and I made a seed drill with which we have planted nearly two acres of ground. We have never seen a garden drill and had none to copy from, but we formed an idea of what it ought to be like. We tried several ways before we were suited and it works well. It makes a furrow, drops and covers the seed and rolls the ground We run it on a sled. It plants almost every kind of garden seeds. We are troubled greatly with cut-worms this Summer.

Your nephew.

Deer Valley, Col. CHARLEY TAYLOR.

[I have forwarded some Pyrethrum seed. Can't you send us a drawing and description of your new seed drill?—U. M.]

DEAR UNCLE MARK.—The seeds you sent brother Robert and myself came all right. We are very thankful for them and we will do the best we can in caring for them. The seeds you sent us one year ago were planted and did well except the Gumbo, which was injured by frost, but I saved one pod of seeds.

We attend school one mile distant and care for our plants at night. Roble is nine years old and I am eleven. In thanking for past favors which I appreciate much, (and think Uncle Mark a very kind man), we would like the seeds of Pyrethrum Roseum if it is not asking too much. We will do all we can for them and report you in due time. We wish you would come to H. and see the many and pleasant farms here in this old town. Most of the people are farmers. ROBIE & JENNIE COLT.

Harwinton, Connecticut.

A good excuse for sickness of yourself and family is that you don't use Hop Bitters.—*Adv.*

"Homes in Texas"

IS THE TITLE OF

A New Illustrated Pamphlet

Descriptive of the country along and tributary to the line of the

INTERNATIONAL & GREAT NORTHERN R. R

and contains a good COUNTY MAP of the STATE. It also contains the names and addresses of Farmers and Planters in Texas who have

Farms for Sale or Rent,

and those who will want FARM HANDS for this year. A copy of this book will be mailed free to those who desire reliable information about Texas, upon application by letter or postal card to

ALLEN McCOY,

Gen'l Freight & Pass'r Agt. Palestine, Tex.

FOR HOMES & REALTIES IN VIRGINIA WRITE TO BUREAU OF IMMIGRATION. RICHMOND, VA.

GENESEE VALLEY FARMS FOR SALE.—Some of the finest residences in the Valley, near R. R Inquire soon of JOHN SHELDON, Fort Collins, Colorado.

PERSONAL ITEMS.

William Inman of the Inman steamship line is dead.

Mrs. Mackey's chief cook is said to have $6,000 a year.

One of the cruelties charged upon Oscar Merritt of Detroit in his wife's complaint for divorce was, that he would not let her put her cold feet on him to warm them.

Associate Justice Clifford, of the Supreme Court of the United States, is reported to be very sick at Cornish, Me. The physicians say his death is likely to occur in a few days.

To-co-be, chief of the Shoshone Indians of Nevada, drives a spanking pair of trotters attached to a handsome carriage. He has made some successful ventures in mining, and is an extensive breeder of cattle.

Mr. Parnell, of West Point, Ga., the champion peach farmer, is the elder brother of the agitator, but was disinherited on account of infirm health. He further suffered injury by an accident some years ago on a Southern railroad.

Ex- Commissioner Bentley says that the pensions next year will probably aggregate $90,000,000. The pension appropriation for the year just closing was $50,300,000, and it was insufficient. Next year from 45,000 to 50,000 new cases will, it is expected, be added to the roll.

Mr. James Gilfillan, Treasurer of the United States, is forty-five years of age and is of Scotch descent. At Williams College he was in the class with Garfield, Rockwell and Knox. He was a clerk in the Treasury for many years. In his office he stands at a high desk, where he has sometimes signed his name more than three thousand times in a day. He wears no jewelry, and does not even carry a watch. The Treasury locks have a clock attachment, and are opened by its operation at nine o'clock in the morning. The Treasurer is the only person who knows all the combinations.

[St. Louis Globe-Democrat.]

A War Relic.

In a very full report recently published in the Philadelphia Ledger, reference is made to the case of Mr. George I. Graham, a prominent politician and active journalist (connected with the Philadelphia Sunday Mirror), who, by using the great German remedy, St. Jacobs Oil, was cured of a troublesome case of rheumatism, contracted during the war. He closes his statement with—"to those who are afflicted with that complaint, it is worth its weight in gold."—*Adv.*

KIDNEY-WORT

DOES WONDERFUL CURES! WHY?

Because it acts on the LIVER, BOWELS and KIDNEYS at the same time.

Because it cleanses the system of the poisonous humors that develope in Kidney and Urinary Diseases, Biliousness, Jaundice, Constipation, Piles, or in Rheumatism, Neuralgia, Nervous Disorders and Female Complaints.

SEE WHAT PEOPLE SAY:

Eugene B. Stork, of Junction City, Kansas, says, Kidney-Wort cured him after regular Physicians had been trying for four years.

Mrs. John Arnall, of Washington, Ohio, says her boy was given up to die by four prominent physicians and that he was afterwards cured by Kidney-Wort.

M. M. B. Goodwin, an editor in Chardon, Ohio, says he was not expected to live, being bloated beyond belief, but Kidney-Wort cured him.

Anna L. Jarrett of South Salem, N. Y., says that seven years suffering from kidney troubles and other complications was ended by the use of Kidney-Wort.

John B. Lawrence of Jackson, Tenn., suffered for years from liver and kidney troubles and after taking "barrels of other medicines," Kidney-Wort made him well.

Michael Coto of Montgomery Center, Vt., suffered eight years with kidney difficulty and was unable to work. Kidney-Wort made him "well as ever."

KIDNEY-WORT

PERMANENTLY CURES
KIDNEY DISEASES, LIVER COMPLAINTS,
Constipation and Piles.

☞ It is put up in **Dry Vegetable Form** in tin cans, one package of which makes six quarts of medicine. Also in **Liquid Form, very Concentrated,** for those that cannot readily prepare it.

☞ *It acts with equal efficiency in either form.*

New Publications.

THE CYCLOPÆDIA WAR.

The month of July, 1881, witnesses the completion of the largest and most important literary work this country and the century have seen. It is the Library of Universal Knowledge, large type edition in 15 large octavo volumes, containing 10 per ct. more matter than Appletons' Cyclopædia, at less than one-fifth its cost, and 20 per cent. more than Johnson's Cyclopædia, at a little more than one-fourth its cost.

Chambers's Encyclopædia, which forms the basis of the Library of Universal Knowledge (the last London edition of 1880 being reprinted verbatim as a portion of its contents), is the laborious product o

Victory

the ripest British and European scholarship. It has developed through a century of Cyclopædia making, its various editions having been many times revised, in successive years, till it has come to be universally recognized, by those competent to judge, as standing at the very front of great aggregations of knowledge, and better adapted than any other Cyclopædia for popular use. It contains such full and important information as the ordinary reader, or the careful student, is likely to seek, upon about 2,500 subjects, in every department of human knowledge. Chambers's Encyclopædia, however, is a foreign production, edited and published for a foreign market, and could not be expected to give as much

For The

prominence to American topics as American readers might desire. To supply these and other deficiencies large corps of American editors and writers have added important articles upon about 15,000 topics, covering the entire field of human knowledge, bringing the whole number of titles under one alphabetical arrangement to about 40,000. Thus the work is thoroughly Americanized, and the Library of Universal Knowledge becomes at once the latest and most complete Encyclopædia in the field, at a mere fraction of the cost of any similar work which has preceded it.

Price

of the 15 volumes, complete, in extra cloth binding, $15.00. In half Russia, sprinkled edges, $20 00. In half Russia, gilt top, $22 50. In full library sheep, marbled edges, $25.00.

The superlative value and importance of this great Encyclopædia lies especially in the fact that it is brought within the reach of every one who aspires after knowledge and culture. It is *really* a library of universal knowledge. It brings a

Revolution

liberal education easily within the reach even of every plowboy of the country and apprentice boy of the city. Every farmer and every mechanic in the land owes it to himself and to his children that such a Cyclopædia shall henceforward form a part of the outfit of his home. To the professional man, and every person of intelligence in every walk of life, a Cyclopædia is *a necessity.*

Of course the old and wealthy publishers who have grown rich (it is said that the Appletons have made a profit of nearly two million dollars on their Cyclopædia) from the sale of their high-priced publications are not pleased that their monopolies are broken and their power overthrown. Of course the book agents and booksellers who have been used to getting from 40 to 60 per cent. commission for sell-

$10,000 Reward

ing these high-priced books are not so well pleased to sell the Library of Universal Knowledge on 15 per cent. commission, though those who are not short-sighted discover that their own interests, after all, are identical with the interests of *the people*, and their real profits, in the end, are increased, by the immense sales which result from meeting the people's wants. The majority of booksellers, however, are better pleased to *slander* than to *sell* this and our numerous other standard and incomparably low-priced publications. But the Literary Revo-

To Club Agents.

lution has always looked to *the people*, in whose interest it is, for its patronage, and it has never looked in vain, as our more than one million volumes printed last year (this year being increased to probably more than two millions) abundantly prove. You can order the Cyclopædias directly from us, and by uniting with your neighbors and friends you can secure club rates as follows:

A discount of 10 per cent. will be allowed to any one ordering at one time three or more sets of the Cyclopædia; and a discount of 15 per cent. will be allowed to any one ordering five or more sets at one time.

As a special inducement to our friends and patrons to go to work *promptly* and *vigorously*, each doing what he can for the dissemination of universal knowledge, we propose to distribute $10,000 in special premiums as follows, in addition to the regular discount to clubs:

$5,000 Reward

$5,000 Reward

to be distributed equally among the first 500 club agents who send us clubs of not less than five subscribers, after June 15th and before September 1st, in addition to the first $5,000 to be distributed among the 100 club agents who, during the same time, send to us the *largest number of subscribers*, not less than twenty in number the amount to be distributed proportionately to the whole number of subscribers which each of the 100 club agents may send us.

The names of the subscribers must in every case be forwarded to us. The first $5,000 named will be distributed as specified as rapidly as the orders are received, and the remaining $5,000 will be distributed promptly on Sept. 1st. The names of the persons receiving these rewards will be printed, with the amounts received by each, and the list sent to all the club agents entering into competition for them. Subscribers must be *actual purchasers for individual use*, to entitle the club agent to the rewards under this offer, and not booksellers or agents who buy to sell again.

Persons desiring to raise clubs may send to us at once for sample volumes, if they desire, in the various styles of binding, paying us 75 cents for the volume in cloth, $1.00 for the volume in half Russia, sprinkled edges, and $1.25 for the volume in library sheep. Orders for the full sets will be filled by us with the utmost promptness, within our ability to manufacture, beginning not later than July 10th, orders being filled in the order of their receipt by us.

Specimen pages of the "Library of Universal Knowledge" will be sent free upon request. Descriptive catalogue of our large list of standard publications, with terms to clubs, and illustrated pamphlet describing book-making and type-setting by steam, will be sent upon application. Remit by bank draft, money order, registered letter, or by express. Fractions of $1.00 may be sent in postage-stamps.

BOLSTER SPRINGS FOR FARM WAGONS.

Made of Best Oil Tempered Steel.

The ONLY RELIABLE Bolster Spring in Use.

SIMPLE AND SATISFACTORY.

They save largely from wear and tear in every part of the Wagon. They remove all necessity for a Spring Seat. They convert a common Lumber Wagon into a Spring Wagon, making it equally comfortable for from one to twenty persons. They are admirably adapted to the wants of Fruit and Vegetable Growers. They are suited to all makes and sizes of Farm Wagons, and can be attached by any one. They make the cheapest and easiest riding Spring Wagon in the market. These Springs have been in practical use for over four years, and are a pronounced success. No Teamster or Farmer can afford to be without them. We want Agents everywhere. Send for description and prices, and mention this paper.

$66 a week in your own town. Terms and $5 outfit free. Address H. Hallett & Co., Portland, Maine

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

Humorous.

A GENTLEMAN in New Orleans was agreeably surprised to find a plump turkey served up for the dinner, and inquired of his servant how it was obtained. "Why, sir," replied Sambo, "dat turkey has been roosting on our fence for free nights. So dis morning I seized him for the rent of de fence.

"I HAVEN'T any money with me to-day," said Pendleton to Blifkins, who had called to collect that little bill, "but I will give you my note." "Your note!" said Blifkins; "is it good for anything?" "I should say it was," replied Pendleton; "everybody in the city has got it." Blifkins declined with thanks. He would call again.

THEY were discussing how to pronounce "oleomargarine." Fogg gave the "g" soft, while Jones declared it should be hard. Said he: "The 'oleo' comes from Latin, and the 'margarine' from early English." "You are wrong there," said Fogg, who is given to levity, "everybody knows it all comes from grease."

"MY brethern," said a western minister, "the preaching of the gospel to some people is like pouring water over a sponge—it soaks in and stays. To others it is like the wind blowing through a chicken coop. My experience of this congregation is, that it contains more chicken coops than sponges.—Andrews' Bazar.

ANGRY wife (time, 2, A. M.)—"Is that you, Charles?" Jolly husband—"Zish me." Angry wife—"Here have I been standing at the head of the stairs these two hours. O, Charles, how can you?" Jolly husband, bracing up—"Shtandin' on your head on t'shtairs? Jenny, I'm saprised! How can I! By Jove, I can't! Two hours, too! 'Stronary woman!"—Cincinnati Gazette.

[Evansville Daily Courier.]

A comforting conclusion is that which leads us always to choose the best. Mr. Andrew Ulmer, of Bluffton, Ind., says: I have thoroughly tested St. Jacobs Oil, and find for rheumatism and neuralgia it has no equal.—*Adv.*

VOL. XL.—No. 1643.} NEW YORK, JULY 23, 1881. {PRICE FIVE CENTS $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Horticultural.

NOTES FROM THE RURAL GROUNDS.

The Silver Bell Tree. (Halesia tetraptera)

WE have but one specimen of this handsome little tree. It is sometimes difficult to separate tall-growing shrubs from dwarf-growing trees. Bnt the Silver Bell is in every way a small tree, having a straight main stem which is very hard, and a bark of dark gray and brown handsomely striated. It has moreover nothing of the shrubby habit, being rather pyramidal in its growth.

This tree is a native of most of onr States from Florida to North Carolina inclnsive, and is very common in rich woods and hedges. It blooms here in late May and the illnstration, which is drawn from our specimen, shows accnrately both leaf and flower, the latter of which gives to it its familiar name of Silver Bell and also of Snowdrop from its near resemblance to the common Snowdrop—Galanthns nivalis. This tree as it is laden with its drooping silver bells is a pretty sight, and the tree itself, from its small size and symmetrical form is well adapted to all grounds of moderate extent. The blossoms, however, are of short duration lasting only two or three days. These are followed by its nut-like, four-winged frnit which persists until frost.

Summer Transplanting.

If several "ifs" are provided for, yonng frnit trees as well as raspberries and blackberries may be safely transplanted at this season. Last year we transplanted two young peach trees in early July; this year ten in late June. All are thriving, the first two mentioned, though started from pits three years ago, are bearing fruit. These little trees were severely cut back. Only a twig or two—each having a few leaves—were left. The soil was carefnlly worked in among the roots and pounded down over them so as to be quite firm. Then the hole, or what remained of it, was filled with water, the rest of the soil loosely thrown in and the earth covered to the depth of three inches with meadow hay. If the season were wet, the watering and muiching would not prove necessary. Bnt it is by far the best to provide against dry weather which at this season is always liable to occur.

RAYS.

ONE of our friends—a merchant—has a pretty lawn aronnd his home. He cuts it well and waters it, and last Spring gave it a good dressing of artificial manure—that made from the blood and other animal refuse at the abbattoir. A month later the effect was very apparent, and, as he was unaccustomed to sowing broadcast, the irregularities in his sowing were as visible on his lawn as are the patches in a cow pasture; on the places where the most dressing fell the grass grew the strongest. All the street are now np in arms and fortified by abbattoir manure. You could not give them any other kind, let alone coaxing them to bny.

* *

THIS reminds me of the wicked waste we often see in stock-raising countries, where heaps of strong, intensely rich mannre are thrown into a pile, a hole, or dumped adown a bank beside our packeries, lost in usefnlness unto the world, bnt lending aid to pestilential vicionsness.

* *

AMONG the coming favorite flowers, Tnberons-rooted Begonias will take a leading rank. They grow so stout and stocky, bloom so continuously and copiously, and their flowers are so big, so showy, and so gracefully arranged, that all people must incline with favor to them. Rose is the prevailing color, but pnre white to deepest red and scarlet, also yellow, are represented, and there are double flowers as well as single ones. In pots or boxes in the window or the greenhouse, with care, they may be easily raised from seeds. Seedlings raised in Spring shonld bloom the following Fall, and again every Snmmer while the tnbers live, and they shonld exist for several years. These begonias are not hardy, but the tubers can be

THE SILVER BELL TREE.—Halesia tetraptera.—Fig. 349.

lifted and wintered as we do caladinms, gloxinias or dahlias, bnt as they are smaller they mnst be more carefully seen to. An exposed, snnny position does not snit them so well as a partially shaded one; nnder the drip of trees they will grow better than most plants.

* *

WAS not the RURAL, p. 340, a trifle too severe on the hardiness of Japanese maples? These lovely little bush-trees, so far as intensity of cold is concerned, will stand a deal without hurt—yes, several degrees below zero; bnt a searing, bleak exposure or a sodden bed in Winter may ruin them with less than even a zero frost. If onr ambition extends to such choice and expensive garden plants as these little maples, whose leaves, so deeply cnt and variously colored, are as beantifnl as blossoms, we should be prepared to give them shelter, not so much from cold as from the searing, frosty winds of Winter and of Spring—death-piercing blasts to animals and plants. Last Winter the woody vines of several of onr clematises were killed into the gronnd; our Japanese anemones are dead every one, while every little maple is to-day brighter, sturdier than it was the year before, nor did we protect them in the least beyond a nest of leaves around their base; their position, which is sheltered, did the rest. [The writer of the above lives a hnndred miles or more north of the Rural Grounds. The thermometer at the latter place on two occacasions marked 16 degrees below zero last Winter.—EDS.]

* *

MY friend Mr. Thorp, of the firm of Hallock, Son & Thorp, the great lily growers of Queens Connty, N. Y., called to see me the other day, and among other things spoken of was that fine ornamental bnsh, Rosa rugosa. He told me that an old lady who lives near them has a large bush of this Japanese rose in her yard, which she claims to be a plant left of an old hedge of the same which grew there in her childhood some 70 years ago, and which as children they nsed to know as the "Chicken Rose." Whence it came she knew not, nor did she apprehend its rarity until she saw it exhibited recently as a "new" plant. From specimens of it submitted by her to Mr. Thorp, he vouches for its identity as a Rugosa.

* *

SOME years ago the stone-crop was in great demand for cemetery work, but of late years periwinkle, ivy and gayer plants, and this "Perpetual Care" arrangement cemetery corporations are introducing, are fast displacing our old favorite. It is a tiny, fleshy-leaved, moss-like plant that makes a very thick carpet, evergreen and hardy, and loves an open, shadeless spot and light or sandy soil to grow in. In June it is a sheet of golden blossoms. An old Albany florist tells me he has made more money off stone-crop than by any other one plant he grows. It makes a nice edging in the garden patch or fringe in the rockery, bnt in all cases it should be grown in full exposure. Torn to pieces and laid npon a sandy snrface, every sprout and piece of broken stem will grow.

* *

GUANO WATER is a first-rate manure for green-house and window plants. It is no patent nostrnm; we know what it is, and that it is good. But in addition to being highly esteemed food for the roots of plants, as a wash for the leaves it is also excellent. Be your plants ontside or in the house, no matter. Yon syringe them with clear guano water, and you will soon observe an increased thrift and fatness of foliage and immnnity from insects over those syringed with clean water. Red spiders, thrips and mealy bugs hate guano water. Nor does the gnano water leave a sediment upon the foliage, as might be expected. Use it in this fashion:—Into a bucketful of soft water mix a teacupfnl of guano; stir well and leave for a day to settle; then pour off the water into another vessel, taking care not to stir np the sediment. Add abont as much more clean water, then nse as freely as you please.

* *

WE sometimes see yonng men and old dismonnt and thoughtlessly hitch their horses in the broiling noonday sunshine while they step inside to make a lengthened call, or on the cool piazza rest and talk, enjoy a melon, maybe, qnite heedless of the patient, snffering animal. Snrely no reader of the RURAL is so inhnman. But the guilty guest is not much more to blame than the indifferent host. Upon our treeless prairies, as soon as we "fix" a home and build a house, we plant some trees to shade our house, sometimes our yard as well, bnt far too often neglect the shade that every hitching rack demands. And little time and tronble would it cost us, but great good and comfort yield us, were we to plant a lot of fast-growing shade trees here and there upon our

farms, to be a sun-shade for our cattle at their pleasure.

* *

I SEE it often advocated that fruit trees may serve a double purpose, namely, shade and orchard, and therefore that they be used instead of elms, horse-chestnuts, maples, tulip trees, yellow-wood, Umbrella Chinus, or such other shade trees as are available for our locality; but I cannot admit it. Give me those graceful elms, umbrageous beeches and handsome maples that rise aloft to reach forth their leaf-laden arms and leave below a wide and high and shaded chamber, where the air is cool and fresh and through which breezes may unhindered blow. Plant your fruit trees in the orchard and set a fence around them there.

* *

YES, our houses are very pretty; they are painted the whitest of the white and the blinds the greenest of the green; but why are the the door-steps and the piazza in such neglected state? Apparently you don't paint them as often as you do your clapboards, while they need it oftener; neither do you always mend them when a board gives way, but swayed and ragged let them stay, a condemning evidence against your tidiness and thrift. They remind us of ladies gayly dressed with plumes and blossoms on their heads, with robes untarnished and bedecked with tasteful trimmings, but whose shoes may lack a button, have heels oblique, or have not yet been polished since they left the store. AGROSTIS.

RURALISMS

I HAVE just been looking at my Exochorda grandiflora, and am delighted to find it for the first time producing seed. This fact will render the plant of easy culture, reduce the price, and place it within the reach of all. We shall only have to wait a little. My plant is one of the first sent out in this country and consequently has some age, which may be necessary for the production of seed. It stands about nine feet high, and is growing in a light, sandy soil. It is pleasant to know that this beautiful hardy shrub may yet become common. It will be well for those who have large plants to examine them for seed. The seed vessel is five-angled and readily seen.

ANOTHER season's trial has satisfied me of the excellence of the Viroflay Spinach. The Savoy-leaved is also good, but will not endure the heat of approaching Summer as well as the Viroflay. The latter may finally be thinned out to a foot apart. The young flower stalk of the Viroflay is stout and very succulent when four or five inches high, and should not be discarded. Cut at the right time, I prefer the flower stalk to the leaf. Try it.

The Ox-eye Daisy of our fields has fairly driven its French cousin, the Paris Daisy, to the wall. In town and country all the women and many of the men now wear the Ox-eye Daisy; and I do not see why it is not almost as pretty to wear in the corsage or button-hole as the other, especially when it has been grown in a rather poor soil, when the common eye is not apt to see any difference between them. The Ox-eye was in common use last Winter, and may still be seen (July 2) in the window of the florist.

THERE has for some time past been more or less talk about forming a "syndicate" for the purchase of Mr. Durand's Jersey Queen Strawberry. The negotiations have come to an end at last, and Mr. Peter Henderson will offer the plant for sale in August. I do not know how far the plant has been tested in different soils, but of the fruit I can speak as being decidedly the best of all Mr. Durand's seedlings. It is not only a beautiful berry, but in quality as near perfection as anything we shall probably have in the way of strawberries for some time to come. I first became acquainted with it three years ago, but have said little about it since I felt doubtful whether Mr. Durand would find anybody to comply with his terms. The Jersey Queen ripens late, but is none the worse for that. I sincerely hope that this at least of Mr. Durand's seedlings will prove to be adapted to general cultivation.

THE engravings given by the editor, in the RURAL of July 2, show the "hilling" and "flat culture" systems of corn raising very nicely. Let me add a word or two in regard to the ability of the stalks to withstand a hard "blow" under flat culture, and in confirmation of the editor's experience in this respect. In "talking" flat culture for corn I have almost invariably been met with the objection, and nearly always in the same words, "Yes, but your corn will all blow down." The simple fact is that corn will stand up better under flat culture than under the hilling system. I have always found it to be so, and for reasons which the illustrations of the editor make obvious. Corn will go down more or less in very heavy rains accompanied by strong winds; but in flat culture it will mostly come up again, whereas in hilling the mass of earth lying against the stalks prevents this. Economy, too, is decidedly in favor of flat culture, as I have proved over and over again. The large farmers in a section where flat culture was before unknown, are giving it a trial this season, and thus far are quite satisfied. I know what the result will be. [As a matter of economy in time and labor, we hope they will next try drilling in the seed. EDS.]

A FEW years ago I rode frequently on the Northern Railroad of New Jersey. On one occasion a herd of cattle was on the track. The engineer slowed up and "whistled" the poor things along for half a mile or more, when he put on a head of steam and rushed into them pell-mell, tossing them in the air, killing and horribly mangling 11 of them. In doing this he endangered the life of every passenger on board, and lost at least ten minutes of time. A few weeks since I rode on the Southern Railroad of New Jersey, and, just this side of Manchester, some handsome young Alderney cattle were on the track. The engineer slowed up, and as they did not leave the track on the approach of the train, one of his assistants ran ahead and drove the cattle off. He may have lost two minutes of time (instead of ten), but no cattle were killed and no human lives endangered. The engineer's conduct elicited praise from everybody around me. I wish I knew his name. These two examples deserve the consideration of railroad managers throughout the country, or at least of those who are not so stolid as to be indifferent to human life. It seems to me that the conduct of the latter engineer should be made the basis of a rule for all railroads. Cattle, for some reason, seldom leave a track with a locomotive behind them. This has been a matter of common observation with me.

I SUPPOSE we may say good-by to the contemplated international exhibition, and, under the circumstances, I am not sorry it is so. The first one held in New York was a failure, and this, from the manner of its initiation, promised to be a greater one. New York would seem not to be a good place for such things. That it would succeed in Boston I have no manner of doubt. There is a fine spirit of local pride there which we have not.

DO NOT forget the forthcoming meeting of the Pomological Society in Boston. Let us once more gladden the heart of its venerable President by a great crowd. It will please him beyond measure to welcome a full delegation from every section of the entire country.

HORTICOLA.

THE HUCKLEBERRY.

THERE is one thing in the cultivation of small fruits which I cannot understand, and which I have oftened wondered at. We cultivate the strawberry, raspberry, blackberry, currant, etc., and we go to great pains and expense to improve these excellent sorts, but why do we entirely neglect the huckleberry which is hardier than any of them, and only second to the strawberry in most respects, and in some respects its superior? I would not dispute the claim of the strawberry to be "the finest fruit God ever made," and yet the day will come when it will have a powerful rival in the huckleberry, or blueberry, as it is sometimes called. When I remember its many excellencies, I do not know that I ought to place it after the strawberry, for I am inclined to think it is its equal. It holds the same place among small fruits which apples hold among large ones. It is perfectly hardy, passing through the severest Winters unharmed, while the berry is firm, a good keeper, and will endure long transportation. It may lack the aroma of the strawberry, yet it is scarcely less delicious. Served with sugar and cream it is fit for a sovereign; while for pies, or canning for winter use, it is in my opinion, unrivaled, and far superior to the strawberry or any other small fruit now in cultivation.

There are several varieties of the wild huckleberry, but no attempt has ever been made to improve any of them, so far as I am aware. [Yes—attempts have been and are being made.—EDS.] At least two varieties grow on my native mountains in Northern Pennsylvania. I suppose them to be the Vaccinium Pennsylvanicum and V. vacillans of the botanists. [The botanical name of the huckleberry or American whortleberry, is Gaylussacia (Gray); Vaccinium is the cranberry or bineberry. Outside of New England, however, the blueberry is commonly called huckleberry. The distinction is here noted, however, to prevent confusion in the minds of some readers.—EDS.] They grow on high, rocky and sterile soil, the first—which is most abundant—being from six to fifteen inches in hight, and the last, from one to three feet. The low variety is first to ripen, and I have frequently seen the ground blue with them. Often in my earlier boyhood have I gone in company with others and gathered a bushel or more in one day, and sometimes I have camped out on the ground, sleeping at night on the top of the mountain, by a pile of blazing pitch-pine. Such times are ever to be remembered in the life of a boy. I always observed that the most and finest berries were obtained from young and thrifty bushes springing up where others had been destroyed by the forest fires which frequently—almost annually—sweep over the mountains; and I have thought that perhaps here was a hint worth remembering in the cultivation of this fruit. I sincerely hope that our horticulturists and all fruit growers will give more attention to this neglected berry, which is a hardy native of our own land, thriving on the poorest of soils, free from all insect enemies, and which generally escapes the late frosts of Spring. I transplanted some of them to my own garden in late Spring and am giving them a trial. I can readily imagine that an acre of them well cultivated would look as fine as they would taste delicious. A. S.

Mansfield, Pa.

[We are afraid our friend will think less of them after the trial he proposes. But we wish him success.—EDS.]

REMARKS ON ORCHARDS.

WHEN an orchard is not cultivated, the roots lie nearer the surface and feed on the soil, which is not the case when the ground is plowed, as they are torn off and destroyed within the reach of the plow, which is usually about the depth of the soil.

I am aware that this idea is opposed to the general teaching, but, nevertheless, the orchard I have alluded to is a successful demonstration of the practical wisdom of not plowing orchards, or, at least, not plowing them as it is usually done. We intend to make our perpetual orchard a perpetual pig pasture, as we believe pigs are the best adapted of any stock to run in an orchard. They will help to enrich the ground more than any other animals, and at the same time, by eating the fallen apples, they will destroy the worms which prey upon the fruit. In accordance with this purpose we have seeded our orchard with Orchard Grass, which does best in the shade, and shall try the experiment of a continuous sod.

The trees planted to renew the old ones will be allowed to grow with low-spreading tops to facilitate the gathering of the fruit. Low branches will also render the fruit less liable to be blown off, which is an important item, as it will save a considerable percentage of loss. I do not believe in digging up old stumps when young trees are to be planted in their places. I prefer to plant the young tree by the side of the stump, as this affords a protection to it, keeps the ground mellow and moist by its decay, and also furnishes food for it. We hold that there is no more natural support for the tree than a tree or its equivalent—a stump. The proof of this is found in forests, where young trees are found growing rapidly by stumps and decaying logs. It is more attractive to see a young, thrifty tree growing with a future prospect of good fruit than an old one, unsightly and unprofitable. Young trees convey the impression of profit, while old ones suggest loss.

COL. F. D. CURTIS.

Floricultural.

DOUBLE-FLOWERING DEUTZIA—WEIGELA AMABILIS, ETC.

ONE of the prettiest shrubs to be found in blossom at the present time—July 4th—is the Double-flowering Deutzia—Deutzia crenata fl. pl. Like many others of our ornamental shrubs, its beauty depends upon the amount of care and attention it has received. The flowers are double, white tinged with rose, and last for a considerable time. They are produced in racemes from four to six inches long, in great profusion. It is very correctly described as being one of the most desirable flowering shrubs in cultivation. By the way, however, I notice that Ellwanger & Barry advertise a new variety of this deutzia, Pride of Rochester, which they describe as having larger flowers in longer panicles than the older sort. They also claim that it is of more vigorous habit and a more profuse bloomer. If this is all that is claimed for it, it is a decided addition to our list of ornamental flowering shrubs.

[Deutzias grow as readily from seeds as do beets. Seeds of the double-flowering kinds produce a goodly proportion of double-flowering plants. We have many seedlings at the Rural Grounds, several of which are in some respects superior to catalogue kinds.—EDS.]

I notice that the Lovely Weigela (Weigela amabilis) is in many places dead to the ground. As they are now throwing up an abundance of strong and healthy shoots, it is evident that the roots are healthy. As some are dead in sheltered as well as exposed situations, it cannot be that they were injured by the past severe Winter. I should like to know if they have been injured in other localities. Will some of the readers of the RURAL give us the desired information? This is a very desirable variety, as it blooms quite freely in the Autumn. In color the flowers are bright pink.

CHERRIES are ripe, and prove to be a larger crop than was expected; but they are being rapidly destroyed by the rose bugs, and some varieties are rotting very badly, the Black Tartarian especially so. I notice, however, that the rose bug prefers the Black Eagle to any other variety. It is impossible to obtain a plate of cherries from a large-sized tree, so numerous and destructive are these pests—and, by the way, we have no remedy.

THE CHINESE WISTARIA stood the Winter here without sustaining much injury; but all the blossom buds were killed.

THE STRAWBERRY season is about over, and I hope that we shall soon have some reliable notes concerning the new varieties that are candidates for public favor. From what I have seen of the Bidwell I regard it as the most promising of the new sorts. Among the older varieties Charles Downing excels all in the quantity of berries produced, but the largest-sized berries were obtained from Seth Boyden. Green Prolific bore an immense quantity of berries, but they were mostly of small size. Does this variety need extra cultivation to properly develop and perfect its crop of fruit?

THE COMMON WHITE LILY (Lilium candidum), that grand old flower, is now a very attractive object. The large clusters of pure white flowers are also deliciously fragrant, especially in the evenings. Were I confined to the cultivation of one lily, I would select this variety. It is perfectly hardy and thrives in almost any garden soil. It requires deep planting, and should not be disturbed for several years after being planted. Be careful not to give it rank manure, as this invariably destroys the bulbs. Good, strong bulbs can be cheaply obtained, and at least several groups of this noble lily should be found in all gardens. [That is true.—EDS.]

Is there any difference between the Round and the Savoy-leaved Spinach? Planted side by side here, they were pronounced identical by all who saw them growing. [We have never tried the latter.—EDS.] CHAS. E. PARNELL.

Queens Co., L. I.

BOCCONIA JAPONICA

For Ornament and for Bees.

PROFESSOR J. L. BUDD.

I NOTICE in the Eastern States this plant is becoming popular in sub-tropical gardening and for isolated beds upon lawns. We have a bed filled with it on the college lawn, which attracts the attention of visitors during all its stages of growth, but especially when covered with its immense, compound-panicled head of fringed white flowers and creamy white buds. During May and June its very large, tropical-looking foliage makes it an object of interest. Though coming to us from the land of the tea-plant, the oleander and camellia, the roots of the bocconia endure our Winters as perfectly as do those of the Dielytra spectabilis from the same region. For the three past years I have been watching the plant in view of its probable value to bee-keepers. During its extended flowering season our plot is frequented by honey bees to an extent not observed with any other plant except buckwheat. The bocconia is so rampant in growth, and its great leaves so cover the ground, that weeds and grass cannot exist beneath it. For this reason the care of a plot amounts to nothing after it is once established. Plants may be started from small sections of the surface roots, which suggests the possibility of its becoming a troublesome weed. We have found it so easily killed by cutting off the parts above ground in its stages of vigorous growth, that I do not apprehend trouble from growing it in flower gardens or in plots for bee forage.

Agricultural College, Ames, Iowa.

Success with the Rural Seeds.

WE had so many plants from the carnation and picotee seeds sent us that we could hardly find room to plant them out, and we anticipate great pleasure in seeing them bloom next Summer. We have two aquilegias from a previous distribution of the RURAL, that we consider very fine—one is sky-blue and white and the other cream colored with the carnation stripe, and both are very double. We have two Weigela shrubs from the RURAL seed, one of which is about four feet across; the flowers are single, of a deep rose-color, and bloomed in May. We have one Amorpha shrub that is growing very well. The leaves of one of the Rose of Sharon shrubs appear to be variegated. I send for name flowers and leaves of a rather beautiful shrub that grows in our timber. It blooms in June and July and is sweet-scented.

Tangent, Oregon. R. L. S.

[Please send us a few leaves of the variegated Rose of Sharon, giving your address and stating it was from the seed we sent you, that we may know about it. The plant sent is the Mock Orange, or Syringa—Philadelphus. EDS.]

Arboricultural.

THE PRESERVATION OF OUR FORESTS—NO. 3

CLINTON.

The Patriarchs of the Forest.

IT MAY perhaps be supposed that I am somewhat of an enthusiast on the subject of forest trees, and of trees generally. It may be true, and I am willing to plead guilty to the charge, if anything censurable is implied in it, for to me trees have always had an attractive charm. I could not in boyish days stand beneath a noble pine and listen to the songh and the sighing of the breezes through its branches, without a feeling of awe almost akin to veneration. And even now, in mature life, if I stand before a noble oak or a magnificent elm which for centuries has been contending with the warring elements, whose branches give evidence by their scars of the many severe conflicts they have had with the lightning and the tempests, and whose sturdy trunk, gray with the mosses of centuries, still stands firm and erect as if bidding defiance to the blast, I cannot resist a feeling of solemnity approximating to reverence. I once had opportunity to determine the age of one of these monarchs of the forest, which it became necessary to cut down on my own premises to prevent damages which might be occasioned by the fall of portions of its decaying top, and I found its concentric annulars to indicate it to have been a centenarian at the time Columbus discovered our continent. But this was a mere juvenile pigmy when compared with those stupendous giants of the Pacific Slope, whose origin is believed to date back thousands of years; not merely to the time of the advent of the Saviour, but back to the founding of Rome, back even further to the days of Homer and Hesiod, back even to the days of David and Solomon; even back, as it is claimed for some of them, to the foundation of Nineveh, or still further back to the days of Noah. And yet, there they still stand, as they have stood for thousands of years, gigantic columns, as it were, supporting the blue arches of heaven.

Admitting that they possess all the antiquity that is claimed for them (and I see no reason to doubt it), one thing is certain, viz., that they have been more enduring than the proudest and most lasting of the works of man; and on their native soil of the Pacific Slope, these trees are majestic witnesses of the average climatic ranges for thousands of years past, in steady succession. For if, on the spot where they have so long stood, there had been any great changes of temperature, even for a few months at a time, these great living witnesses would have been destroyed. They, therefore, testify, better than all our historians, to the average state of things since the dry land first appeared, after the Mosaic deluge. And their testimony is corroborated by that of the great trees of South America, Australia and Teneriffe. But a truce to sentimental theorizing.

The "Big Woods," N. Y.

I have advocated the adoption of a "conservative" policy with regard to our timber lands by our National Government. But I admit that it is becoming too late for such policy to repair the injury already done. Still, with the adoption of a right policy by the several States, much may yet be done to avert the evil which I apprehend as threatening us, in the absence of national action. But it is to be feared that no sufficient reliance can be placed on the action of the separate States, till they shall be aroused to its necessity by the demands of public sentiment. Take, for instance, our own State of New York, proud of the honor of being termed the "Empire State" of the Union. We find still remaining in her northern central portion, and mainly the property of the State, a vast, unbroken wilderness, comprising nearly 10,000 square miles of territory, or 6,000,000 acres of land, including what is known as "John Brown's Tract," entirely worthless for cultivation if cleared, but still covered with a dense growth of timbers adapted to its cold, damp soil. This growth of timber, extensive as it is, would be barely sufficient to supply the demands of our whole country with timber for a single year at the rate we are using it. The soil, as already stated, would be comparatively worthless for cultivation, were it cleared of its timber. This forest, therefore, should be reserved for the benefit of all the people of the State. And yet, twice within my own knowledge our Legislature has chartered companies to run railroads through this wilderness in different directions—not for any of the necessities of travel or commerce, but for the ostensible purpose of opening this wilderness for sale by securing a market for its timber; and, for the purpose of encouraging the enterprise, the Legislature granted to the corporators the right to purchase from the State 250,000 acres of this forest land lying contiguous to the line of their proposed roads, at the nominal price of *five cents per acre*—a tract of land equal in extent to an entire county, for $12,500! This, of itself, indicates how lightly our State values its forest lands. But these enterprises, thus far, have proved failures. Let us hope that all similar projects hereafter will result in failures.

We cannot *afford* to have that romantic region thus desecrated and denuded of its forests for any such purpose. We need its sheltering influence to protect us from the icy winds of the North; and who can estimate the injurious effects upon Central and Eastern New York were this protective barrier to be swept away, and the chill winds of the North and Northwest let in upon us in full force? This forest should be preserved as the great "Central Park" of our State for the benefit of all who desire to visit it and in it to breathe the pure air of heaven; and to which the student, the artist or the professional man can retire in the heat of Summer for rest and recuperation, and where the denizen of the crowded city can find a rejuvenating season of relief from the cares of business, and a relaxation from the restraints or conventionalities of city life. For, for such purpose, I feel assured it would prove more salutary and effectual in its influences and less expensive and demoralizing in its tendencies than any of our fashionable watering-places, or our crowded sea-side resorts.

The "Renewal" System.

But I pass to consider another means of relief from the evil I apprehend from the dearth of timber, and this I will designate the renewal policy. This is a measure in which every land-owner can aid, in some degree, however limited may be the extent of territory which he controls. If he be the owner of but a single rood of land he surely can find some nook or corner where he can plant at least one tree, either for ornament or for use: and every tree thus planted tends, in its proportion, to promote the general welfare by its sheltering and ameliorating influences, to say nothing of its adding to the general beauty of this scenery. To every such person, therefore, as well as to others, I would say, "Plant trees! Plant them for use; plant them for profit; plant them for ornament; plant them for comfort. What you thus plant may be a blessing to many succeeding generations. But the road-side should not be neglected. Plant trees upon each of its borders—fruit trees if you choose, but *plant the trees.*"

The State of New York and some of the other States of the Union have offered liberal inducements for the encouragement of road-side tree planting. But let us not limit ourselves to this. Let us plant wind-breaks and even groves to take the place of, and compensate for, those which have been so indiscreetly destroyed. A recent writer has said, "Young America always cuts down all his trees as a first step toward civilization; then, after an interregnum, when all the kings of the forest have been laid low, he sets out some saplings in white-washed tree boxes, and watches and tends them with fervor." How often have I seen the truth of this remark verified in a half century's opportunity for observation. Let us learn wisdom from the mistakes of those who preceded us.

Necessity for Tree Planting.

Tree planting is, in fact, becoming a *necessity* for us as it has been in the prairie States of the West from the first. There the necessity of planting trees for shelter and for their influence on the climate, as well as for timber and fuel, is more and more appreciated with each advancing year. The lack of timber was what so recently drove out the settlers from naked western Kansas and prompted them, after being thus forced to abandon their all, to endeavor to take possession, forcibly or otherwise, of a portion of the reserved Indian Territory; a purpose which it would seem they have not as yet entirely abandoned. So, too, in Dakota and elsewhere on our treeless Western plains, we read of several families deserting their houses and gathering in one, and pulling down the others and burning the fragments for fuel, to avert the danger of death from freezing during the past severe Winter. The "American Society for the Advancement of Science," at a recent meeting in Boston, recommended that the States should enact laws for the encouragement of tree-planting, and with this object should appropriate money to their agricultural and horticultural societies to be paid in premiums for the largest area of forest trees planted and for their best management. There is not a single State in which numerous barren localities may not be found, which are now treeless and affording no profit whatever for agricultural purposes; some moist, sunken ground that cannot be drained; some rocky ledge; some gravelly, barren knoll or sandy ridge or some precipitous hill-side, serving no useful purpose whatever, unless it be to hold the rest of the country together. Most of these places could be profitably planted to trees.

Judgment Needed.

But in this planting judgment must be exercised in adapting the kinds of trees to the locality, or the effort will be a failure. Our country was originally supplied with as many as 150 different varieties of trees, sufficient in quantity and quality to meet every reasonable requirement. But let us not mistake by supposing that all, or even a majority of these are adapted to our own locality. If we conclude to plant let us select such kinds as are *known* to be adapted to the climate and soil in which we propose to plant. For instance, we may learn by observation that the beech, the ash and the hard maple grow the most luxuriantly on lime formations; the oak on clay; the chestnut on gravel; the pines and the hemlocks on sand; the elms on alluvial bottoms; the walnuts on rocky ledges; and the spruce, white cedar, tamarack and black ash and alders in cold, damp soils and in swamps. Some of these, it is true, may succeed in other soils; but on the whole it will be found better to give observance to the teachings of nature, as shown in her general rules. We may also notice that nature, in her plantings, inclines to mingle a diversity of kinds of deciduous trees together, as she does of grasses. We may do well to follow her example to some extent in this also, and mingle different kinds of trees adapted to our soil and climate. Let us see that they are properly planted and then sufficiently cared for and protected, so that they may as soon as possible recover from the shock consequent on their change of position, if they are transplanted, and we may feel an assurance of satisfactory results. Some kinds are better grown from their seeds. I had designed to speak more fully of the season and the manner of transplanting, but my proposed limits do not now admit of my doing so. Directions are given, from time to time, in regard to tree planting, most of which are valuable but some of which are erroneous, according to my experience, and likely to lead to error. But my further remarks on tree planting, whether for ornament or use, must be reserved till some more convenient opportunity.

The Vineyard.

NOTES FROM THE RURAL GROUNDS.

Crossing Grapes.

THERE are many people who have vineyards of some extent or a number of different varieties of grapes, who never think of raising seedlings, much less of crossing one kind with another, thus selecting the parents. Yet grape-vines are raised from seeds as easily as peach trees, and the crossing of one kind with another is a very simple operation. In this climate the grape-vine blooms about the middle of June, the date varying, of course, with the earliness or lateness of the season. The perfect flower is shown at A, Fig. 350, enlarged to four times its natural size.

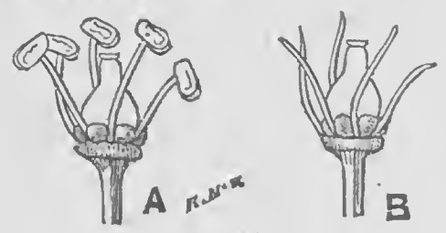

FIG. 350.

Before the anthers ripen, burst and shed their dust, or pollen, they must be cut off, the flower then appearing as in B, Fig. 350. The pistil, as shown, still remains and upon the head of this we are to apply the pollen from the variety with which a cross is desired. A fine camel's-hair brush may be used to collect it, or the ripe anthers may themselves be held in contact with the stigma (the head of the pistil), holding on by the filament, or thread-like stalk which supports the anther. If the pistil is ripe or in a fit condition to accept the pollen, we have nothing further to do except to cut off all the other flowers of the same raceme or bunch, and cover the manipulated flower with fine tissue paper, to prevent any interference on the part of insects or the wind. If, now, it be found that the pollenated flowers set fruit, we may know that our work has been effectual. No evidence of the cross will appear on such berries; but if we plant their seeds the new vine and its fruit will probably differ in part from either parent, while showing characteristics of both. The pollen, or fertilizing powder or grains, may be collected in phials from other vines miles distant, since it has been known to prove potent at least ten days after it has been collected.

We have often taken occasion to urge our readers to interest themselves in this work of producing new fruits. All fruit trees or plants of whatever kind which we purchase from nurserymen and plant in our door-yards, gardens or orchards, at once become the objects of our care and of an interest proportioned to our love of fruit and our desire to beautify our homes. But the cross-bred seedling is, in a measure, one's own creature, and the credit which attaches to the origination of a new and superior fruit is far greater if its parents were selected and united by our own choice and hands. It is better to plant the seeds of grapes as soon as the berry is ripe. Pots of any kind may be used for this purpose and kept in a green-house or sunny window. Some will then sprout in three weeks, though others will require from one to three months. Those sprouting in three weeks or even a month or so, will make fine plants from one to two feet high by the next Spring. They may then be thumped out of the pots into the open ground. But if the seeds are permitted to dry, a much longer time is required for their germination.

Farm Economy.

GREEN MANURING IN NEW ENGLAND.

T. H. HOSKINS, M. D.

NOTWITHSTANDING the unquestionable fact that we have in New England very large areas of land that would be much benefited by the plowing under of green crops, and notwithstanding the equally unquestionable fact that this is a quick and effectual method of restoring to land the "condition" lost by injudicious cropping, the practice of green manuring, so general in New York, Penn., and other of the Middle States, is almost unknown among us. What there is of it is found among the so-called "fancy farmers," and a few others who are above the average in thoughtfulness and firmness of purpose. Noah B. Safford, one of the early members of our Vermont Board of Agriculture, and a very successful farmer, (though a lawyer by profession), was one of the first within my knowledge to systematically and successfully adopt green manuring as a means of bringing up an exhausted farm. His large and now beautiful estate was a sandy farm upon the high bluff, at the junction of the White River with the Connecticut. He has, I believe, no valley land on either river, and his attention was first called to his present homestead by a fine grove of young pines, which were supposed to give about all its value to the property. He bought the farm to get the pine grove, which, though a nice one, is now of minor importance alongside of the fair and fertile fields that spread around it.

The improvement of this farm to its present pleasing and profitable condition is due mainly to green manuring. While the process was going on, and before the results now so apparent were fully realized, Mr. Safford was frequently called upon, at agricultural meetings, to give an account of his operations. Some ten years ago I heard him discuss the matter and was particularly struck with his declaration, that he had never done anything which required so much real courage as the plowing under of 20 acres of clover in blossom. He said he believed that had been, and would be, the rock upon which every farmer who attempted to improve his property by green manuring would split, unless he was a man of decided firmness of purpose. The temptation to "hay" the clover, instead of plowing it in, would almost invariably overcome him. I believe Mr. Safford was right in this, and that it gives the true reason why green manuring makes such slow progress among our farmers.

If any ask why it should be more so here than in New York or Pennsylvania, I think the answer must be that New England is not a wheat region. As a preparation for the wheat crop, clovering is so manifestly a success that the prospect of a fine yield of grain, to a grain farmer, is sufficient to overcome a temptation which very few dairy farmers can resist. Mr. Safford is strictly a dairyman, supplying from his excellent herd the village of White River Junction with milk, and also making considerable butter. The steady improvement of his grass-land, notwithstanding its apparently light texture, has necessitated a continual extension of barn space, until he now has I think, nearly, if not quite, the largest accommodations for storing hay to be found in the upper Connecticut Valley—and this on a farm where a 40 foot barn was once considered quite sufficient. While this improvement has been going on the farm has constantly paid its way, no large sums having been sunk to secure the ultimate improvement as now seen. The steady annual practice of green manuring, in connection with dairying and the careful utilization of the stable manure, have done it all.

I was myself greatly helped and instructed by hearing Mr. Safford discourse, years ago, upon green manuring, and it was that, with the free use of ashes and bone, which helped me in bringing my own little farm up from a seemingly barren pasture to its present comparatively high condition. I was unable to produce (or, had it been procurable to pay for) stable manure sufficient for the purpose. Ashes, which I could buy for 10 cents a bushel, and bones which I got from old slaughter-houses free, furnished me with mineral matter and clover turned down, stored the soil with organic substance, so that in four years' time the yield of potatoes went up from 80 to 460 bushels, and of hay from a quarter of a ton to over two tons per acre. I have all around me men who are called good farmers. I have

succeeded in satisfying them of the value of ashes and bones, but not one of them has yet been able to do so "wicked" a thing as to plow down a good field of either clover or rye. I can coax them, on their poorest land, to plow under a crop of buckwheat, but that is as far as I can toll them along. The difficulty is simply, as Mr. Safford has said, a lack of courage to forego the immediate use of so much good feeding material.

Orleans Co., Vt.

LEVELING PLOWED FIELDS.

In the article headed "Raising Good Crops of Corn Without Hoeing," published in a late number of the RURAL, there is an allusion to the plan of plowing with the furrows turned toward the center of the field. Now I think this is a matter of considerable importance. I have practiced the method quite a good deal on pieces of stubble ground that had been plowed around in the old way till they were all out of shape. I had never before heard of any one plowing in the way "S. E. T." names, but I took it up myself some time ago, as I saw there was need of some similar plan to level up the ground. How many farmers there are who will tell you that the easiest way to plow a field is to "just strike a furrow around by the fence and plow right around the whole piece." Now if your field were level and the first few furrows were plowed shallow, it would do very well for once or twice, perhaps. But after a field has been plowed around for a number of successive years it gets in wretched shape—heaped against the fences or at the edge of the piece plowed, with a broad dead-furrow extending from each corner to the center of the piece, and an ever-deepening one, like a canal, in the center. This dead-furrow is, of course, making the soil in that part leaner every time it is plowed; but the greatest damage to the crop then put in is done in the corners, where the team tramp down the plowed ground hard at the end of each furrow. It is very plain that the turnings of the team at the ends of the furrows does pack the ground a great deal—so much so that, in hauling out manure for spreading, any one will almost unconsciously drive as far as he can on these four packed roads to the center of the field. That ought to be proof enough of the hardness of the ground.

When a field gets in this state it cannot be remedied by plowing in "lands," or by plowing with the swivel plow, turning it all one way. The only true way to level it up is by simply *reversing the process* by which it was plowed out of shape. This is best done in the way named at first, and is easily done unless the field is partly on a hill-side, or is very uneven or full of knolls. Quite often the surface of it will show for itself just where the dead-furrow in the center of the field begins and ends. Then simply back-furrow, filling this up, and when a few furrows have been turned, plow across the ends of them, going around the back-furrow and turning towards the middle. It will come out alike on all sides of the field, and, instead of four hollows extending from the center, the land plowed in this way will be slightly ridged in the same places, like a flat back-furrow. Then there will be the satisfaction of knowing that every part of it is alike mellow, as the team have not stepped once on any part of the plowed ground.

If necessary it would be an easy matter to locate the center of the field each way by measuring or even carefully pacing it. I find it still better to place some marks on the fences opposite these points, as it saves time. I once read of a farmer, somewhat noted at the time, who would have his fields level and made them so by carting the soil from the edges to fill up the dead-furrow at the center. It probably had never occurred to him that there was an easier way to level it when out of shape, or he would have adopted a plan similar to this one. T.

South Cairo, Greene Co., N. Y.

Field Crops.

TOBACCO NOTES.

THE experiments of tobacco growers in Chemung Co., N. Y. this season, in setting tobacco plants, have lead to the general conclusion that plants will start more quickly and grow better when set before rather than after a heavy rain storm.

SMALL plants with large roots will succeed better than large plants with small roots. Of this there is no doubt. But the best plants are those having a good-sized top and a correspondingly large and fibrous root. Long tap-rooted plants are not desirable. They are difficult to set properly and are slow to become rooted. The acreage devoted to tobacco raising is rapidly increasing in this State. In Tioga Co. (Pa.) it has nearly doubled in the past two years. Farmers are now growing from eight to ten acres where last season not more than five were planted. What the increase will lead to remains to be seen, but the probability is that the lower grades of leaf will soon become a drug in the market.

THERE is much diversity of opinion among tobacco growers in regard to the best time for setting the plants. Some prefer to set early, or before June 10; others argue that late settings produce larger crops at less cost for cultivation and fighting insect enemies. The setting of plants in this valley has now continued for a full month and much yet remains to be planted. The yield of the crop of '81, if the season should prove favorable, must exceed last year's estimate by at least 20 per cent.

THE heavy rains during the past month have so compacted the soil in tobacco fields that early-set plants seem slow to start, and it is a difficult matter to get the soil in good condition with hoe and cultivator. The only way is to cultivate *very often* and *very thoroughly*, letting the cultivator's teeth run deep into the soil. Thorough and careful work in hoeing is also important. The soil between the plants should be made mellow, and when a crust has formed on the surface it should be broken or removed, to allow the air to penetrate and the gases in the soil to escape. It is an unwise practice in hoeing tobacco, to merely scrape the weeds out, leaving the surface about and between the plants as hard as a brick. It needs to be thoroughly pulverized.

THERE are always a good many farmers inquiring for tobacco plants after it is too late for successful planting. These are farmers who do not understand the tobacco-growing trade. They have not yet learned even the rudiments of tobacco raising. My advice to such men is to plant such ground as they intend for tobacco to some other crop which they can grow successfully, postponing tobacco culture until they have learned how a crop should be grown. It is true, experience is the only true teacher in this line of farming, but a few things need to be learned before it is attempted. The manner of making beds and sowing seed, the best way to prepare the ground and the best time to plant are all subjects which may be learned from others, and unless they are understood in a measure, failure is certain.

TALKING with an extensive tobacco manufacturer (who is also a grower of the weed) a short time since, I asked his opinion as to the probable outcome of the tobacco-growing business, mentioning the great increase of production. His answer was, "Good tobacco will *always* sell for a price that will well repay the producer. There is no danger of overproduction of the higher grades of leaf so long as the rising generation continues the use of tobacco." Low grades cannot now be produced at a profit to the grower. It is only by careful management and great energy employed in the growing and manipulation, that tobacco growing can be made remunerative. Therefore my advice to those who contemplate undertaking tobacco raising, is to first study up the matter until the rudiments of the business have become understood, and then, beginning first on a very small scale, aim to grow only good leaf. G. G., JR.

Chemung Co., N. Y.

THE FERTILIZATION OF WHEAT.—Referring to what has lately been said, in the RURAL, on this topic, S. B. P., of Ottoville, Ohio, writes us that last year he selected seven heads of smooth wheat and sowed the kernels alongside a bearded variety. This year one-third of the product are bearded. While some varieties in his opinion will "mix," others will not, as those that do not open their spikelets cannot receive the pollen from other sorts.

The Herdsman.

HEREFORDS IN THE WEST.

T. L. MILLER.

THE movement which has resulted in the high position attained to-day by Hereford cattle in the West began in 1873. At that time very few knew of the breed, and their claims to superiority were ridiculed. The breeders of Short-horns were convinced that for the production of beef the position of their cattle at the West could not be disturbed. The public sales of Short-horns during the above-named year averaged from $250 to $700, individual animals reaching from $1,000 to $8,000, and a couple of years before—in 1870—the McMillan sale averaged $900 per head. Accordingly when the Herefords made their first appearance here before the public the Short-horn interest seemed more firmly established than ever before. The fancied impregnability of their position had led the Short-horn men to indulge in a warm controversy among themselves as to the relative superiority of different families, and on this question the contest between them raged as hotly as it does now between Short-horn and Hereford breeders, and in the midst of the conflict the appearance of the Herefords and their modest claims to superiority over all the Short-horn tribes for economical production and excellence of beef, were scarcely noticed except to be ridiculed. The Short-horn supporters pointed to the fact that their breed had been generally accepted both in Europe and America as the best of all, and insisted that this public recognition of their superiority was ample proof of its existence. "If," said they, "the Herefords have the high excellence their present advocates claim for them, it would have been discovered before this and they would have found their proper place."

Such was the state of things from 1872 to 1875 and so powerful were the fame of the Short-horns and the influence of breeders and dealers in them, that if the success of the movement for the introduction of Herefords had depended on their introduction among the farmers and stockmen in the States, the result would have been doubtful. About that time, however, the cattle interests on the plains was assuming large proportions and offered a fair field for the new enterprise with good prospects of ultimate success. Already Herefords had obtained a foothold with Mr. Church, near Denver, Colorado; with Mr. J. W. Powers at West Las Animas, and with Mr. Culver at Longmont, whose herds were taken from that of Mr. Stone of Canada. The animals had proved themselves well adapted to the condition of the country, and other stock owners were willing, nay, anxious to try them on a small scale; but the distance was too great between those who wished to buy and those who were willing to sell, and it was therefore difficult to get the demand and supply together. This trouble, however, was soon overcome by taking the bulls to the West for a market. There they soon became favorites, and at even prices would be used in preference to all others. They were also shown before the leading agricultural societies and made a good exhibit at the Centennial in 1876 at Philadelphia. At the Western shows the "machines" were largely in the hands of the Short-horn men and used for the furtherance of that interest; but in spite of this drawback Herefords have made steady progress.

The first large sale of Herefords at the West was made to the Messrs. Swan & Bros. at Cheyenne, Wyoming Territory, and this was the result of the purchase of the Culver herd of cattle in which there were Herefords, Short-horns and Polled Scots; the Messrs. Swan, however, after due investigation determined in favor of the Herefords. They made their first purchase of some 40 bulls for $10,000 in 1878, and from that time the success of the Herefords has been assured. They are now in the hands of a great many men through the States, men that keep from 10 to 20 cows as well as those that keep from 50 to 200. Among these are some of the wealthiest cattle and business men of the country. Among them may be mentioned Mr. C. M. Culbertson, of Chicago, one of the leading and earliest packers of the West, formerly of Jones & Culbertson, afterwards of Culbertson & Blair. Having a farm of some 2 500 acres on which he was grazing and feeding steers, Mr. Culbertson purchased from me in the Fall of 1877 six Herefords at the Illinois State Fair, and afterwards he added several head more, and was so well pleased with them that he has purchased of several other parties and has made two importations from England. He has now a large herd of pure-breds and is breeding some 200 high-grade Hereford and Short-horn cows to Hereford bulls. Messrs. Earl and Robb, of Lafayette, Indiana, who have been for years large graziers and feeders of bullocks, are now owners of a large herd of thoroughbred Herefords, and are breeding a large herd of high-grade Hereford and Short-horn cows to Hereford bulls. Mr. Thomas Pouting, who has been a prominent cattle man of the West for 30 or more years, and for several years a breeder of thoroughbred Short-horns, is now breeding his thorough-bred Short-horn cows to Hereford bulls and has also a large herd of pure-bred Hereford cows.

These are but samples of what is being done with Herefords throughout the West. Those who have been breeders of Short-horns for years and then take the Herefords, indorse all that is claimed for them, and become firm Hereford advocates.

Herefords are good grazers and feeders; they are hardy, mature early and are of excellent quality. They have made their claims boldly and with confidence. They have been obliged to go before our agricultural Societies and show against Short-horn cattle with Short-horn judges. While often leaving the ground in such contests without awards, they have achieved a substantial success with the public. This has been especially true at Lafayette, Indiana. The Tippecanoe County Fair is held at that town and is one of the most prominent county fairs at the West. It is in its character a district fair.

At the first show there, there was no class for Herefords; but the sweepstakes exhibit was of Herefords and Short-horns. I left the ground without an award. The Herefords again made a show there, and as between them and the Short-horns they made no winnings, still the Herefords at La Fayette have more friends than at any other point in the West, and from the exhibits at this Tippecanoe County Fair. Messrs Earl & Robb and others in the immediate vicinity are strong friends of the Herefords. The show of Herefords before the Illinois State Board of Agriculture, at Chicago, as fat stock, for the past three years, has given them a prominence that promises a greater success than any other influence. While this show has called forth more hard feeling and more opposition, still the result must be largely to the advantage of the Hereford interest. The Hereford movement is a recognized success at the West, and there the Herefords are sure of topping the market as beef steers.

Early in this movement I made the claim of 25 per cent. advantage in the grazing and feeding quality of the Hereford over the Short-horn, and of 10 per cent. in the selling value. I offered to breed 200 cows in Illinois, the one half to Hereford and the other half to Short-horn bulls, and that their produce should be brought to the Chicago market to test the comparative value of the two breeds. I also made a proposition to breed 2 000 cows, one half to Hereford and the other half to Short-horn bulls, in Colorado, and that their progeny should be brought to the Chicago market and there submitted to a test that should determine their relative value for the plains. I recognized the fact that rival claims would be made, and that some fair and equitable test should be adopted that would determine values. Such a test, if begun ten years ago, would have now settled this controversy, and proved or disproved the claims the Hereford men are making, as well as the right of the Short-horns to the position they have occupied.

The demand for bulls of Hereford blood has prevented steers coming to the markets in large numbers. The number is continually increasing, however, and a few years will find them on the markets in quantities to command special quotations for Hereford bullocks. They have already established a reputation for being the best grazers of all the beef breeds, and the past Winter, which has been a very severe one on the plains, has established the fact that they are the hardiest, and not excelled in the faculty of taking care of themselves, or—as the plains-men express it—they are the best "wrestlers."

The Hereford breeders in England, from their first efforts looking to the improvement of this breed, have bred with a view to produce the best bullock for the butcher, and this is the strong point of the breed; and the butcher's block is the best test of the merit and fitness of any beef breed. Their efforts have not been simply to produce the largest and most stylish steer, but to produce the best at the least cost.

The standard Hereford steer is short in the leg, compact and heavily fleshed. Such a steer is always reckoned among butchers as the most profitable to kill and cut. He is recognized among cattle men as the profitable steer to purchase for grazing and feeding; and whether he is a Hereford, Short horn, Devon or Scot he is accepted and commands the highest market price. Such a steer is the rule among the Herefords; he is the exception among the Short-horns—hence the value of the Herefords as a beef breed.

In coming before the public at the Fat Stock Show held at Chicago, the Herefords came at a disadvantage, from the fact that the Short-horn breeders had thousands from which to select their show bullocks, while the Hereford breeders had but few. They gathered their choicest animals from every section, and were enabled to bring but four thoroughbred Hereford steers. Two or these were exhibited by me, and were purchased from the Hon. John Merryman, of Maryland; the other two were exhibited by Mr. William Powell, and were purchased of Mr. Blake, of Maine. Four grade Herefords were exhibited by myself. Three of them were purchased for the show and one was bred by me. These were all that could be got together for the show in 1878. Besides these there were exhibited three Hereford cows. The cow Jennie was exhibited by myself, and took the sweepstakes premium as the best cow in the show. The Hereford exhibit at the show of 1879 was somewhat better, and that at the show of 1880 was clearly in favor of the Herefords.

But these exhibitions have not touched the main question as between the Herefords and Short-horns, and that is the question as to economy of production. This is the real question at issue between the Herefords and all other beef breeds, and on this question, fairly tried, the Herefords will stand first of all breeds. Not only is this true of the thoroughbred Hereford bull, but it is also true of his produce from whatever breed he is put upon.

The produce of the Hereford is always a Hereford, and of Hereford quality; and this question should not be accepted because Hereford breeders claim it; *neither* should it be passed with the feeling that these are partisan views; for there is enough in the present and past history of this breed to warrant one in investigating these claims. If there is 25 per cent. more economy in feeding Herefords than there is in feeding any other breed, then there is a way for every New York farmer and every New England farmer to make his farming operations pay him a profit, to give him a pleasant employment and an outlook that will make it desirable for his son to hold the farm. And beyond this, if there is a market value of 10 per cent. for Hereford over Short-horn beef, there is a home market within 25 miles for every bullock that can be raised in New York and New England.

One other point—these bullocks can be turned off when 16 months old, weighing from 1,000 to 1,400 pounds, live weight, and of a quality that will command top prices; and at 30 months they will weigh from 1,500 to 1 800 pounds. The value per head any dealer can compute.

Will Co., Ill.

OUR ANIMAL PORTRAITS.

Guernsey Cow, Lady Jane No. 2.

Of late Guernsey cattle are winning a high reputation wherever they are known in this country, chiefly in New Egland, New York and Pennsylvania. In comparison with their neighbors from Jersey, the Guernseys are much larger and hardier; make better beef carcasses when turned off for the butcher; are able to endure rougher weather and shift for themselves better, while the bullocks make strong and excellent draft animals, a purpose for which their more delicate rivals are entirely unsuitable. The calves, too, are large at birth and make heavy veals when about a month and a half old. The milking capacity of the Guernsey cow is fully as great as that of the average Jersey, and the milk is usually as rich in butter, which in color is of even a deeper golden yellow. Guernsey grades are remarkably like their pure-bred ancestors both in color, "handling" and their milking as well as feeding capacity. In England Guernseys are quite numerous and have long been great favorites, and large exhibits of them are made at the principal fairs every year. One of the chief shows of this sort is that of the Bath and West of England Agricultural Society, which was held the other day at Tunbridge Wells, a fashionable watering-place on the borders of Kent and Sussex. The accompanying excellent likeness of "Lady Jane No. 2," re-engraved from the Agricultural Gazette (Eng.), is that of the first prize winner in her class at this fair. As will be readily seen, it represents an admirably formed animal—the *beau ideal* of a dairy cow.

Jersey Queen of Vermont.

The RURAL published a portrait of this remarkable cow some time since. Recently her owner, Josiah Kenerson of Barnet, has sent me some reports of her butter yield that are noteworthy. From May 20th to June 1st, (12 days) she gave 485 pounds of milk that made 20 pounds and 7½ ounces of butter. June 1st to July 1st (30 days) 1,396 pounds of milk that made 80 pounds and 6½ ounces of butter; or, for the whole time, (42 days) 1,881 pounds of milk, yielding 100 pounds and 14 ounces of butter. The feed was not reported, and I cannot state whether there was any preparation or "fixing up" for this trial or not. She was at pasture, and I presume she had some grain feed in addition, But a cow that even by "fixing up" will average nearly 2½ pounds of butter during a test of 42 days is "no slouch."

Orleans Co., Vt, T. H H.

Remedies for "Warbles" and Warts on Cattle.

W. F. K. writes from Clinton, La., that an effectual remedy for "warbles" or "wolves" on cattle is to drop from eight to ten drops of turpentine into the hole of each, which will kill the pests in from 24 to 48 hours without causing any pain to the animal. To cure warts on cattle he recommends equal parts of common cooking soda and lard, well mixed and thoroughly rubbed in. By this means a complete cure is painlessly effected in from three to four weeks.

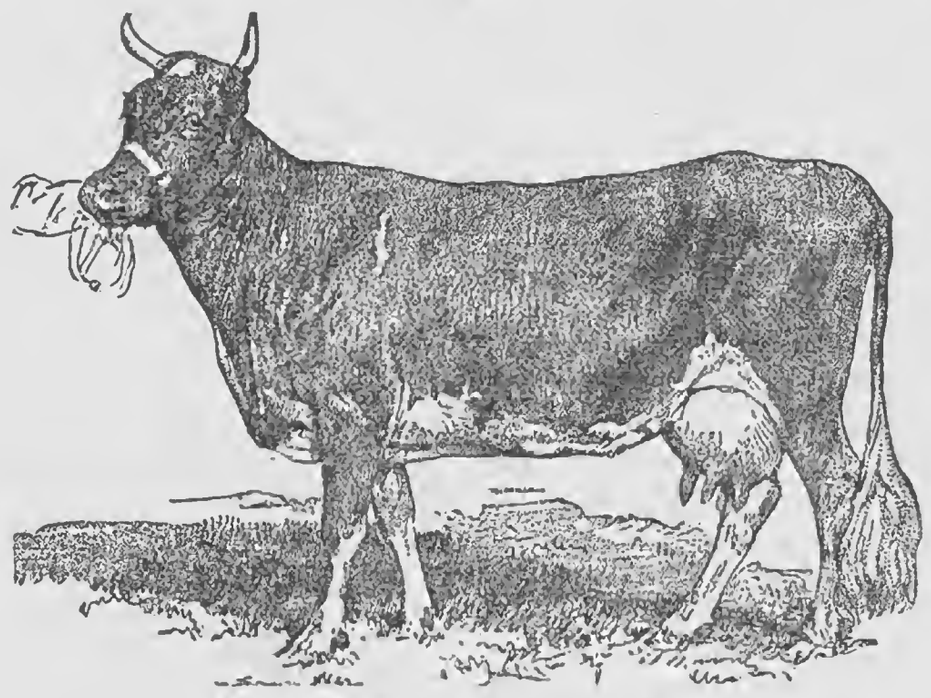
Entomological.

ABOUT THE ŒSTRUS BOVIS.

SERENO EDWARDS TODD.

In looking over back numbers of the RURAL I came upon an article on the above pest in the issue of last January 22, p. 53. The writer thereof has reiterated several grave errors concerning the Œstrus bovis, or gad-fly. Much that is recorded in cyclopedias in regard to the gad-fly is wholly erroneous. As the RURAL NEW-YORKER is desirous of publishing facts, truth and correct representations rather than error, I trust that no one will feel aggrieved at a friendly criticism. I have been practically familiar with the transformations and operations of the gad-fly for more than 50 years. When I was accustomed to yoke calves and young steers and hitch them to my hand-sleigh, my father explained to me all about the gad-fly, and during the 40 years past I have been familiar with the movements of the parent insect, the larvæ and the chrysallides, and also with the efforts and means employed to exterminate the troublesome pest.

The gad-fly is propagated in the following manner:—During the Summer months a large



GUERNSEY COW, LADY JANE, NO. 2.—FIG. 351.

fly, that annoys neat cattle exceedingly, darts down on the backs of the helpless animals when they are resting quietly in the shade, and also while they are eagerly grazing in the open field, and while clinging securely to the hair. the enemy thrusts her keen-edged lancet through the tough integument on the back of an ox or cow, until the ovipositor can place an egg in the soft adipose tissue directly beneath the tough skin. The puncture made by the sharp instrument of the fly closes as soon as the ovipositor is withdrawn, and the little wound heals in a day or two, so that the egg of the gad-fly is placed securely beyond the reach of any injury incident to rubbing or severe pressure on the surface of the body. A common opinion is that the eggs stick to the hairs of the animals, and that after hatching the insects eat their way into the skin. That will not do for one ambitions to be considered an entomologist. The warmth and moisture of the tissue beneath the skin cause the egg to hatch in process of time. An egg never would hatch on the back of a bullock or cow while clinging to the hair, and if it were to hatch, the little tender larva would be crushed forty times before it could bore a passage through the tough hide.

No one has ever been able to determine how long a period elapses before the egg hatches, neither has any entomologist learned how long the insect lives in the larval state, or how many days, weeks or months are passed in the pupa or chrysalid state. Yet we *do* know that the eggs which have been oviposited beneath the skin of the ox or cow yield each a larva, or grub, which subsists on the adipose tissue, or fat of the animal, all through the larval stage of transformation. Then, as soon as the larvæ have attained their full growth, they pass into the chrysalid state, where they remain secure from all harm during the Winter. There is no orifice in the skin through which air may enter to sustain the life of the tender grub. The larvæ of the gad-fly do not require fresh air any more than trichinæ in the flesh of swine.

After the Winter has passed and when the warm weather has come on, the chrysalid commences the natural transformation to the parent-insect state. After the chrysalid has become a *fly*, which is the parent insect, the fly gnaws and nibbles a passage up through the skin of the ox or cow, where it remains until it is fully developed. In many instances, when the eggs have been oviposited early in the Summer, the larvæ will become so large that *they* will wriggle and work and gnaw clear up through the tough hide, even before they have been transformed into chrysalides, and sometimes such premature larvæ actually wriggle out of the backs of the animals and tumble to the ground. But all such grubs, or larvæ, perish or are devoured by the birds The larvæ of the gad-fly never pass the transformation in the ground or on the surface of the ground. The writer of the article on page 53 is fearfully enveloped in numerous errors touching the manner of transformation of the gad-fly. The backs of cattle constitute the natural *habitat* of this insect. The parent insect spends its existence wholly in the open air.

The transformations of the gad-fly occur as follows:—The eggs are oviposited by the parent insect in the backs of neat cattle. Larvæ are produced from the eggs; and the larvæ *usually* pass to the chrysalid state while in the adipose tissue of the ox or cow. The chrysalides are transformed, while in the backs of the cattle, into *flies*, which, when fully developed, emerge from their cells in the backs of neat cattle, mount their wings and soar away. Then, while in this stage of insect transformation, the males and females pair, after which the females oviposit their eggs in the backs of cattle, and then die. The foregoing are scientific *facts* which cannot be controverted.

The remedy advocated by the writer of the article above referred to, *appears* all right on paper—pressing the grubs out of their holes on the animal's back in Winter with the thumb or two thumbs, and either killing them or leaving them on the ground to freeze—but after he has handled as many neat cattle as I have he will understand that it is not true that in the Winter the grubs may easily be pressed out in this way. (I know cyclopedias say so. A distinguished writer on the horse states, in a famous cyclopedia, that the mare always drops her foal while she is *standing*.)

The cheapest and most effectual remedy is to provide a rough rubbing or scratching pole for cattle. Then, as soon as an insect, whether it is the larval, chrysalid or fly transformation, begins to emerge from the back of an animal it will be crushed. If cattle are properly carded, every insect, as soon as it thrusts its head above the surface of the skin, will be lacerated by the teeth of the card. As soon as the grub or the parent insect has bored a passage up through the skin, the irritation will prompt the animal to scratch the irritated part of the body. Then, if a good rubbing pole has been provided, not a single insect will ever escape to oviposit eggs in the backs of other animals. I would recommend the above writer to examine the "bumps," as he calls them, before the insects have worked a passage through the skin, and then report to the RURAL whether he found it an easy thing to squeeze the grubs out with his thumbs. I have often taken a glover's needle (a needle having a triangular point) and thrust the point through the skin down into the grubs, or larvæ. The needle will kill every one it enters. But a good rubbing pole is preferable to any other means. To make such a rubbing pole, place one end of a long and heavy pole on the top of a post about five feet high, set firmly in the ground, and pin it fast. Let the other end rest on another post, two feet high, and pin it securely to the post. Neat cattle of high or low stature can pass beneath this heavy pole, adjusting themselves to the inclination of the pole. Animals that have unrestrained access to such a pole will never be troubled with the warbles, or with the anti-phrenological *bumps* to which our friend alludes on page 53.

Scientific and Useful.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN NO. 65, JUNE 23, 1881.

Fertilizer Analyses.

633. G. W. Miller's Raw Bone Superphosphate, made and sold by G. W. Miller, Middlefield. Sample drawn by E. P. Augur.

634. Dissolved Bone Black, made by Bowker Fertilizer Co., Boston and New York. Sold by Henry D. Torrey, Putnam.

635. Dissolved Bone Black, made by the Mapes F. & P. G. Co., 158 Front St., N. Y. Sampled from a set of experimental fertilizers.

634 and 635 were sampled and sent by W. I. Bartholomew, Putnam.

630. Dried Blood, made by Sperry & Barnes, New Haven.

631. Dried Blood, made by Strong, Barnes, Hart & Co., New Haven.

633. G. W. Miller's Pure Ground Bone, made by G. W. Miller, Middlefield. The above were sampled and sent by E P. Augur, Middlefield.

630 apparently contains considerable tankage.

631 contains some hair.

Miscellaneous.

ILL WEEDS.

W. G. WARING, SR.

Ill weeds grow apace. All farmers and gardeners learn, among their very first and plainest experiences, what prime necessity there is for care that neither the seed to be sown nor the manure to be used with it shall contain any germs of tares. For to prevent them is by far easier and safer than to pluck them out, after they have already absorbed the ready strength of the soil and weakened the plants we value, by their shade and their voracity.

In the moral garden of human community the same care is requisite. The more it is manured and stimulated with the salts of civilization the more weeds are apt to flourish and destroy all near to them. It is said of the county of Potter, Pa. that railroads have not penetrated it yet, nor are there any very large towns, and no licenses to sell liquor have been granted since 1852. In more than half the townships no poor-tax at all is levied or requisite. The jail has seldom an occupant. Of the three jury courts held last year all adjourned before the close of the first week.

Where these lines are written there is a very different condition of society—nothing like sleepiness or stagnation, but a whirl of stir and fever. Good schools for the young; but all the attractiveness of pleasant teachers, well kept, handsomely fitted rooms, pictures, maps, object lessons and illustrative apparatus—all do not equal the attractions of the stirring streets. Our school directors, justly proud of their schools, ruled that none of the children should ever be broken in spirit by the use of King Solomon's instrument of correction, but on proving refractory should be sent out of school—"suspended." This takes out of the schools the youth who above all others need the school's saving influences. The suspended children are apt to have imprudent or negligent, if not depraved, parents. They are suffered to roam the streets. After school they tell and describe to the school-goers all that they have learned or seen of wild and vicious conduct, and soon there are two opposing schools, one of which has the advantage (to itself) of being on a down-grade. No parent sees or hears or knows what infection of vicious thoughts and tendencies, and what desire for false pleasures and exciting sights their children derive from the contamination of the flock by suspended members.

These *moral* influences are like the seeds we sow in our gardens in the opening days of Spring. If not sown then, and duly cared for, and protected from weeds beside, they fail. There are other virtues—those of economy and thrift—which do not vegetate so early, but may

and should be sown at a later period. An admirable move is being made in England in this direction. The great number of wrecked lives there makes the poor-rates a terrible burden on the industry of the country and the expenses of courts, jails, etc. In addition are enormous. The wiser and better disposed of the poor have been led into more careful habits by various societies for their encouragement and notably in the cities by the late simple arrangement for post office savings banks.

BOOKS, CATALOGUES, ETC.

FERTILITY.—A treatise of 70 pages by J. B. Lawes, Rothamsted, England, published by David Bogue, 3 St. Martin's place, Trafalgar Square, London, W. C. The substance of this work appeared in late numbers of the Agricultural Gazette of England, from which, as our readers are aware, we have quoted freely.

THIRD APPENDIX to the Fruits and Fruit Trees of America. Second revision and correction, with extensive additions, including the appendices of 1872 and 1876, and containing many new varieties. Seventy-five pages. By Charles Downing. New York, John Wiley & Sons, 15 Astor Place.

INDIANA AGRICULTURAL REPORTS FOR 1880. A handsome volume of 502 pages. Alex. Heron, Sec., Indianapolis, Ind.

GOOD FARMING.—It is one sign of a good farmer if he prizes manure. It does not require a good farmer to raise bountiful crops on a farm already rich, but the art lies in so managing the farm that it will produce good crops every year without losing in fertility. A man may make money from his farm while he is wasteful of fertilizers, but he is not a good farmer, for he is constantly running his land into debt. Good farming consists of such management as will make the farm produce the best possible results without deteriorating the soil. This can only be accomplished by a rigid economy in the making and use of manure, and a systematic rotation of crops that will be the least exhaustive to the soil. G.

RURAL BRIEFLETS.

THE RURAL NEW-YORKER, strong as its words of praise have been in regard to a number of the plants and seeds it has sent to subscribers, cannot be accused of exaggeration, or of even indulging too freely in the "flourishes" which in advertising projects are quietly over-looked by truth-telling, right-minded people. The Cuthbert Raspberry may now be judged, since it has been tried in almost every part of our country. The claim made in our Fair No. of 1879, which announced the Distribution of '79 and '80, was that "it is at once the highest flavored, largest, most prolific and hardy variety of red raspberry known." The various opinions which have been expressed by leading fruit-growers everywhere have been placed before our readers from time to time, and it may be questioned whether any new fruit has recived a greater unanimity of praise or so little censure. Now speaks our leading pomologist, Charles Downing, in his Third Appendix (just published,) to the Fruits and Fruit Trees of America:

"A chance seedling in the garden of the late Thomas Cuthbert, Riverdale, N. Y. It is said to be hardy, *and is generally so*, but I have seen it more or less killed in severe and changeable Winters, or when the canes were not well ripened; it has so far proved a *valuable market* variety, also *one of the best for family use;* it is very productive; canes strong, vigorous, upright, sometimes branching; spines, short, stout, purplish, rather numerous; it suckers freely, too much so for the benefit of the plant and fruit.

Fruit medium to large, scarlet crimson, roundish, obtuse-conical; grains rather small, compact; separates freely from the stalk; flesh quite firm, juicy, sweet, sprightly, having a slight flavor of the common red, which, is probably one of its parents."

The Italics are ours. Mr. Downing pronounces it the same as Queen of the Market, an opinion in which all good pomologists agree except Judge Parry who first advertised the Cuthbert under that name.....

SPEAKING of the quality of the Niagara grape, Mr. Downing coincides with the opinion expressed by the RURAL, though objected to by a number of excellent judges, as rating it too low: Mr. Downing says:

"Flesh soft, tender, sweet, pleasant, and in quality about the same as Concord, and ripening with it or soon after."....

To our view, Mr. Marvin's "Word for Polled Cattle" in last week's RURAL, hits the nail squarely on the head. Horns are indeed deadly weapons rarely if ever needed by domesticated animals though frequently used to the greater or less injury of themselves and loss of their owners.....

WE are pleased to learn that trees of the Japan Maple, Acer palmatum (the species mostly used as stocks for the varieties and in itself a beautifully distinct maple), twelve feet in hight, growing in Prospect Park, Brooklyn, (N. Y.), have not been injured by the past Winter. We find also the following [note by the editor, Prof. Thos. Meehan, in the current number of the Gardeners' Monthly:

JAPAN MAPLES.—According to the RURAL NEW-YORKER, the Japan maples tested on the grounds of the editor "have not proved hardy during the past Winter." In the vicinity of Philadelphia the numerous varieties show so much sameness of character that only one kind may be said to be popular—"Acer Jap. atropurpureum," as it is popularly called, or Japan Blood-leaved Maple. We have seen, perhaps, four hundred of these this Spring without knowing of one to be injured. Passing along in the street-cars through Germantown, one may now see a pretty plant, some three feet high, on the grounds of the editor of the Germantown Telegraph, in full, healthy leaf, after total exposure all Winter. On the writer's grounds is one five feet, also wholly uninjured, though standing alone on a very exposed place on the lawn. We fancy the experience noted by the RURAL NEW-YORKER is exceptional.

WHAT in the world can induce agricultural papers to repeat nowadays that the mole is driven off by the Ricinus or Castor-oil plant? The mole has no repugnance to this plant whatever.....

SAMUEL HENSHAW, of Staten Island, has a full collection of the Japan Maples planted six years ago. Surprised at the report of the injury they had sustained at the Rural Grounds, he called to say that not one of his varied collection was harmed in the least. Mr. Henshaw is a florist and uses the leaves for decorative purposes. Thus, he says, we get the handsomest of Fall leaves in the Spring.....

YEARS ago, when we were crossing variegated and green-leaved pelargoniums (geraniums), it happened in a number of cases, that while the leaves of the seedlings of such crosses were all green, cuttings from them would sooner or later develop variegated shoots. Such shoots are called, in familiar language, "sports." Yet there can be little doubt that they were due to the development of the blood of the variegated parent. We have little doubt that "sports" of all kinds might be similarly traced, if they only could be traced at all. A lesser potency, if it may be so expressed, may lie dormant for years before favorable conditions occur for its development.

.....

A LITTLE party at the Rural Farm pronounced the Telephone peas the best, the sweetest, the most tender of any they had ever eaten.

What Others Say

HOW TO GET A FULL MILK PAIL.—We assume that the cow is properly fed. Lacking this condition, no cow can milk as she ought, says the London Live Stock Journal. But careful feeding seems to have but little influence on the milking properties of some cows; they lay on flesh instead. Yet, as they have first of all to live before they can think of giving much milk, or in fact any milk at all worth speaking of, and as about two-thirds of the food they have an appetite for goes to sustain the offices of life, it is clear that under-feeding will not lead to a profit. This is a proposition well enough established, and it appeals alike to our judgment and interest. Yet, after all, breed is of the first importance, because without it good feeding is of small effect on the milk pail; but, if we have both breed and feed, the pail will overflow—if we let it. Breed, then, is first; food, next; then good milking by hand, kind treatment, shelter from the storm, and all that.

A SIMPLE and excellent remedy, says Waldo, in the Ohio Farmer, in case of swelling and inflammation, is sal ammoniac dissolved in vinegar. He has never seen any liniment that would so quickly and certainly reduce a swelling in the first stages.

AGAIN he says that all milkers are likely to be troubled more or less with cracked teats, and when nothing is done to prevent or cure, sometimes a cow gets so bad that it is weeks before she can be cured. If one keeps a few ounces of glycerine in the stable, and at the first appearance of roughness or cracking pours a few drops in the palm of the hand before milking, it will stop all trouble at once. Occasionally a cow gets a teat cut or scratched with briars so as to make it almost impossible to milk her. He has known a cow to dry up from this cause. Every time we attempt to milk a cut teat we break open the old wound, and if it is a bad one, it is almost impossible to heal it. Every dairyman should have a set of milking tubes to use in such cases. Waldo does not use them at all for ordinary milking, but in such cases as those referred to he finds them of value.

DEAD BRANCHES ON TREES.—Mr. Thomas Meehan remarks that his readers must remember that only recently has it been clearly demonstrated that a dead branch on a tree makes almost as great a strain on the main plant for moisture as does a living one. It is one of the most important discoveries of modern botanical science to the practical horticulturist, as by this knowledge he can save many a valuable tree. When one has been transplanted some roots get injured, and the supply of moisture in the best cases is more or less deficient. Any dead branch, or any weak one, should therefore be at once cut away. So in pruning trees at transplanting, the large, lifeful branches should not be cut back, as is generally done, but the weak, half-dead ones that are usually left should be the ones to cut away. The large, stout ones are reservoirs of sap, which the plant needs; the half-dead ones draw on these reservoirs and contribute nothing of their own.

AND so it appears that cocoanut shells, ground up, are used to adulterate pepper and perhaps other spices.

THE Gardeners' Monthly says that scarce kinds of roses may be propagated this month, by eyes of the unripened wood taken off just after flowering, and set in sandy soil in a shady place. Cuttings from shoots grown in partial shade root better than those matured in the full light.

MAKING SIRUP FROM SORGHUM.—We find in the Husbandman a plain account of how a writer makes his sirup from the Amber Cane. He says that with a good two-horse, three-roller mill, worth $60, capacity 200 gallons per hour, by getting an early start he makes sixty gallons of good, heavy molasses per day. His boiling pans are made of wood, with galvanized iron bottoms, size 30x84 inches. The sides and ends are plank 1¼ inch thick and 10 inches deep. He allows two pans to a mill of this capacity. The furnaces are placed in a line, with the chimney in the middle. An old stack to a steam-engine makes a very good chimney. The furnaces are 24 inches wide in the clear, so that the pans extend over a little, which prevents the plank from burning and keeps them from boiling over. There are a few evaporators around there but with proper care and attention he makes just as nice sirup as the evaporators do. The main requisites are, quick boiling, careful skimming, and thorough cleaning of the pans after each boiling. The pans are furnished with four handles (hoop iron makes a very good handle) near the corners, extending high enough above the pan so that a pole can be passed through from one side to the other, and four men can lift the pan and empty it. To tell when the sirup is done, lift the skimmer, and if the sirup hangs to it and falls in drops, it will do. A little experience will decide. In regard to the cane, his experience has been that the best plan is to allow the cane to get ripe. What he calls ripe, is when the seed begins to get hard. So doing one gets less juice, but makes better sirup, with less boiling and less skimming; and to plant the seed at such a time that the cane will have all the hot weather on it that it will bear increases its saccharine qualities. For stripping he uses a forked stick, and gives the fodder to the land, as this crop is a very exhausting one. He often makes molasses from the various sorghum canes, so sugary that in Winter it can be cut with a knife, and all it needs to make sugar is to be drained. He uses no lime or anything of the kind to settle it.

THE Philadelphia Press says that Burlington's veteran gardener, Nathaniel Stowell, aged 92 years, has discovered and proved the efficiency of green sage leaves as a thorough preventive of the ravages of the Colorado beetle upon growing potatoes.

ANOTHER NEW STRAWBERRY.—The horticultural editor of the N. Y. Sun says that New Jersey strawberry growers are again jubilant over another new seedling strawberry which has been named the Manchester. Like all new varieties it is said to be something wonderful as to color, size and flavor, and it is thought will prove a very fine market berry because of its firm flesh. The Wilson's Albany, growing in the same field, is said to make a poor show beside this new wonder. The writer has seen similar reports regarding many of the newer sorts, but has never found a variety that was superior to the old Wilson for productiveness. Perhaps the "Manchester" is the strawberry of the future, he says, but of this we will know more a few years hence. [It will not take so long as that we confidently predict. The berry fruited at the Rural Grounds the present season. Our readers are requested to bear it in mind.—EDS.]

IT must be borne in mind, says Dr. Lawes, in the London Agricultural Gazette, that experiments conducted in a laboratory, or under any artificial conditions whatever, require to be tested in the field before they can be accepted as final, or have any value assigned to them as regards the settlement of practical questions of agriculture. Speaking as a farmer, the question he wants to be solved is, whether the organic matter of the dung which he applies to his land produces growth in his crops, either by increasing the ammonia in the soil, or by any other means, such effect being in addition to that due to the nitrogen and minerals contained in it.

IN the latest Mark Lane Express (London) we find the following: "The world's wheat prospects and present realizations are such as to render it an indifferent matter to Europe whether the United States wheat harvest turns out a little more or a little less than that of last year; there is a fair prospect of plenty. Reports from the United States are, as yet, strongly suspected of being influenced by speculative interests, so that in reality very little dependence is placed upon them here. The bulk of the testimony being in favor of an average crop of wheat on the area sown, it is accepted here tentatively, to that effect.

THE MANCHESTER STRAWBERRY.—Again we find in the N. Y. Times a startling account of the new Manchester Strawberry, which is not yet offered for sale: "The Manchester is a new seedling accidentally produced by a Mr. Batty, of Manchester, N. J. This berry is said by some good judges to be really extraordinary. It is growing upon almost pure sand and produces abundantly large, handsome, conical, scarlet berries, red-fleshed, firm, juicy, and of a sprightly and rich flavor. The keeping qualities are also highly spoken of. The varieties of this fruit that will do well upon sandy soils are few in number, and a good, well-flavored berry, firm enough to ship and keep for three days and of attractive appearance, as well as good enough for private gardens and farms, and that will succeed upon light, dry soils, will soon become a very popular one. For a berry that will do well upon almost pure sand and with but poor cultivation will be something remarkable on better soils and with good treatment. And this is what is claimed for the Manchester."

THE Herald says that honest industry is all very well in its way, but a bononza which enriches us in twenty minutes and helps us to make fools of ourselves all the rest of our lives—oh, that is our dream of bliss! . . . . "Sam you are not honest. Why do you put all the good peaches on the top of the measure and the little ones below?" "Same reason, sah, dat makes de front of your house marble and de back gate chiefly slop bar'l, sah." . . . . A little bit of a girl living near one of our cities, ran in to her mother from the road-side with some early Spring blooms in her hands, and full of the outside glow, exclaimed: "O mamma, how nice it is to live where somebody doesn't own everything!" . . . It takes 800 full-blown roses to make a table-spoonful of perfume, while ten cents' worth of cooked onions will scent a whole neighborhood. . . . . Agricultural chemists have published wrong conclusions too often to be dogmatic.—N. Y. Tribune.

"There is no unbelief:
Whoever plants a seed beneath the sod,
And waits to see it push away the clod,
He trusts in God."

Everywhere.

RURAL SPECIAL REPORTS.

Canada.

WEYMOUTH, N. S., July 6.—Wheat looking well—principally Lost Nation and White Russian. Oats and barley good, but the acreage decreasing, both being superseded by wheat. Corn not much planted; prospect poor, but there is a slight improvement of late. Potatoes and garden crops look well; but owing to the cold, wet weather they are a fortnight late. The hay crop will probably be a good average, but late. Apples, pears, plums, quinces and cherries abundant. Small fruits plentiful. Squash bugs are the only insect pests of any account. The potato bug has never made its appearance in this county, and I have not heard of it anywhere in the Province. Altogether, with the exception of corn, there is a good outlook for an abundant harvest. W. H. S. D.

Colorado.

HILLSBOROUGH, Weld Co., July 6.—Farmers in this portion of the State are jubilant over their prospects, and from present indications the yield will be enormous. All kinds of small grain are doing well; wheat is stiff at $2 55 per cwt., and produce of all kinds brings a good price. J. W. C.

Maine.

LEWISTON, Androscoggin Co., July 7.—More wheat sown than last year—Lost Nation chiefly. Oats in area and yield are above the average, but little barley or rye grown here. The tendency is to grow more of wheat and oats. The former has done much better the last few years than formerly when rust and weevils nearly or quite destroyed the crops. Farmers are beginning to find out that they can raise wheat to advantage. The prospect

is very good for apples and pears, raspberries, blackberries and strawberries. More corn has been planted and more interest felt in the crop than formerly. Potatoes look well, but the bugs are very plentiful. The prospect is good for fine crops of almost all kinds of farmers' produce. It has been very cold thus far with frosts on low lands, cold and dry. H. A. C.

Nebraska.

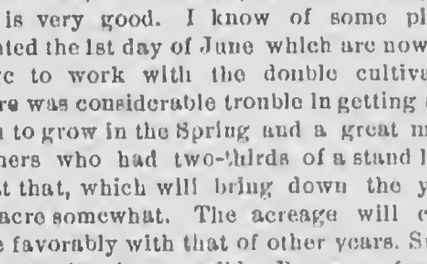
WOODLAWN, Lancaster Co., July 7.—All small grains, especially oats, are looking well. Chinch bugs are operating in wheat quite badly. I have seen some quite fine pieces of rye now being harvested. Not very much is raised here. But very little barley also. The principal varieties of wheat sown are China Tea, Grass and White Russian, the last mentioned is not much thought of in this section. Corn is king in Nebraska; the outlook at present is very good. I know of some pieces planted the 1st day of June which are now too large to work with the double cultivator. There was considerable trouble in getting seed corn to grow in the Spring and a great many farmers who had two-thirds of a stand let it go at that, which will bring down the yield per acre somewhat. The acreage will compare favorably with that of other years. Small fruits in abundance—wild. But very few orchards in bearing in this section. No apples of any account. "B"

New Hampshire.

KEENE, Cheshire Co., July 13.—Wheat and barley are but little grown in this county. Rye and oats are looking fine. Corn is very backward, but is of good color and a warm July and August will give us a good crop; acreage about the same as last year. Apples a very light crop; pears good; of strawberries we have had an abundance. Grapes have not set well and are mildewing somewhat. Raspberries and currants heavily loaded. W. L. D.

Ohio.

CAMDEN, Preble Co., July 2.—My Washington Oats are doing very well, considering the drought. My Mold's Ennobled Oats I thought would be a failure, but they are now looking better; but neither of them is as good as our Joway Oats, all sown on the same field—bottom land.



1, Washington; 2, Mold's; 3, selected side oats that I cut out of common oats; 4, 4 4, Joway Oats which are much the best. W. M.

OTTOVILLE, Putnam Co., July 2.—Acreage of wheat about the same as last year; it is about ripe—some have commenced cutting. It is rather short (owing to May drought) but well filled—mostly Fultz and Clawson. We have some early ripe oats; not much sown this season on account of the late Spring. Harvest is about a week late this year. Corn looks well, but late on account of replanting—too much bad seed was planted. Potatoes look well, but there are lots of potato bugs. Few apples and not much small fruit. Hay is short and thin. S. B. P.

South Carolina.

CLIO, Marlborough Co., July 4.—Wheat, an average crop with an average acreage—mostly Red May, Fultz and Baltimore White. A considerable falling off in yield of oats in consequence of late sowing and a dry Spring—mostly Rust-proof, White Winter and Black Norway. Corn prospect fair, with a decline in acreage. Orchard fruits almost a failure; small fruits about a fair yield. J. B. W.

Texas.

WACO, McLennan Co., July 4.—On Friday night last we had the first rain in six weeks, and the continued drought has cut off our corn crop. We cannot make half a corn crop in any event, but cotton is looking very well. Those that raised small grain have had a fine time for harvesting and saving it, and the yield of wheat and oats will be over an average. Owing to the want of rain, the potato crop is short, and they are now selling at $2 50 per bushel. I have had a hard time to keep my strawberries alive, and also my young grapes; many of each did succumb, although I watered the latter regularly, but I attribute the loss of them to the heat of the ground about the roots, and if I had placed around them a thick mulch I might have saved them. My raspberries and old grapes have suffered comparatively little and look green and fresh. From the seeds received from the RURAL this Spring, I have a fine supply of pinks of all colors and styles, some of the handsomest I ever saw. My asparagus came up well, but I lost some of them from the drought. My White Elephant potato did not do well, but I have seed enough to make a good trial for another year. A. S. S.

Vermont.

SHELBURNE, Chittenden Co., July 7.—It is quite dry again although we had a rain a week or ten days ago, which gave crops quite a start. Corn and potatoes are very small, owing to the cold weather we had soon after they came up. Farmers are in the midst of haying, but are getting a light crop. Butter is selling at 18 to 20c. W. H. P.

Washington Territory.

STEILACOOM, Pierce Co., July 5.—The crops are looking well. There is very little barley or rye raised in this section and no corn as a field crop. Our climate is not warm enough to mature corn well except in the valleys. No better crops of wheat, oats and grass are raised in any portion of the United States than in Western Washington Territory. Orchards immediately around Puget Sound are looking fine, but away from the Sound the frost has injured fruits generally. I planted about 60 plum trees two years ago last Spring and think I shall have five bushels of fruit from them this season. They were three-year-old trees when planted. I have never seen a section where fruit is so easily produced as around the Sound. Small fruit is doing well this season. I have been on the Sound only two years; have cleared my land of heavy logs and stumps and planted my fruit since my arrival. Strawberries and raspberries are fine. From young plants I raised Sharpless strawberries this season that were six inches in circumference around the base of the berries. The Cuthbert Raspberry is doing remarkably well. I think I received the first on the Sound of all the best new varieties of berries. I am sure they will thrive well here if anywhere. My raspberries grow all Winter, never shedding their leaves. We never have to cover any of our fruit. In the Charles River Valley, about sixty miles from here, I purchased, in 1874, a farm about 40 acres of which had been cropped upwards of 20 years without manure. The second year after my purchase I raised 30 bushels per acre of splendid wheat, upon an average, on the whole tract. In one instance, upon new land, I raised 45 bushels of wheat, and for oats and Herd's-Grass there is no better land in the world. But immediately around the Sound the soil is poor compared with that in the valleys. Still, with the energy that it requires in the New England States to make a success of farming, this would be superior to that section on account of the mildness of the climate. I think the climate of Western Washington Territory as healthful as any in the world and the soil quite as fertile as the average. C. T. F.

West Virginia.

LUMBERPORT, Harrison Co., July 11.—The acreage of wheat is equal to, if not greater than, last year's, and, generally speaking, the yield is heavier and the quality better. The wheat harvest is nearly over and has been nicely saved, it having been fine weather all through harvest. The varieties sown are Lancaster Red, Fultz, Clawson, Mediterranean, some Red Chaff and Zimmerman; but the leading varieties are Lancaster and Fultz. The acreage of oats is not large, the farmers giving more attention to the cultivation of wheat, but the present prospect is good, and if no accident befalls the crop it will be much heavier than for some years past. Barley, but little or none is cultivated. Of rye the acreage is small, but what little was sown is said to be good. The acreage for corn is said to be not so great as last year, but I think, taking the county over, it will foot up about the same. Owing to the lateness of the season and the difficulty of getting the first planting to stand, the crop does not give indications of being anything like equal to last year's crop, and wheat harvest coming on so soon, farmers have not had a chance to give the crop the attention it should have had. Generally speaking, corn is short and does not look well. Apples will not average half a crop. There will be a few peaches in favored localities. Pears and quinces but few. Cherries are a failure except in some favored localities, and other small fruits are equally scarce. I will just add here, meadows are unusually heavy, and potatoes and other garden vegetables are looking fine. We are having extremely hot weather, the mercury denoting 98 to 102 in the shade for the last two weeks, interspersed with heavy thunder, wind and rain, sweeping timber, unroofing and blowing down houses, scattering fences, etc. W. H.

Wisconsin.

WIOTA, La Fayette Co., July 4.—Business calls in various portions of this county have given me good opportunities for sampling the crops, and I can now confidently report as to their condition and promise. The bulk of the crops consists of corn, oats and flax. Corn is backward, but is hurrying up as fast as I ever saw it, to make up for time lost by late planting, rather poor seed, and many long, cold rain storms and very cool nights as a rule. Oats and flax cover a very large area and are magnificent—never better. Very little Spring wheat was sown and the Winter wheat, though of considerable area, is generally thin on the ground, though, taking the county altogether, probably one-third promised a very good yield, till within a few days. On sampling a field a few days ago, of luxuriant growth and very promising appearance, then in the milk state, I found it badly rusted on the blade, and this probably is, or will be, general. Clover fields of large extent, have become general within two or three years, and clover was very heavy universally and is now all in stack, well cured. This week the haying will be commenced and the prospect of a heavy yield was never more satisfactory. Owing to a scarcity of seed, probably not more than one-half as many potatoes were planted as usual, but I have not seen or heard of any bugs, and as what there are never looked better, we shall probably have enough for ourselves, but none to spare. As for fruit, I think I have never known so general a failure as to orchard products which consist, here, entirely of apples with a very few plums and cherries. Even the wild plums and crab apples have failed to a very great extent. W. F.

The Querist.

ANSWERS TO CORRESPONDENTS.

Green-Manuring for Wheat.

"Young Farmer," Yorkshire, N. Y., says that at writing he was plowing under a crop of clover and intending to sow buckwheat to be also plowed under when in blossom as a preparation for sowing Winter wheat, and he asks, 1 whether such a plan is advisable; 2, why does barley turn yellow.

ANS.—1. The plowing under of the clover is an excellent preparation for the wheat to follow, but the sowing of buckwheat and the plowing under of that crop is by no means a judicious one for the following reasons: wheat requires a firm, compact seed-bed, and the loose buckwheat plowed under soon before sowing the wheat will completely prevent this requisite condition of the soil; wheat also requires decomposed or mineralized food, and while the clover will provide this because there is time for it to decay before the wheat is sown, there will not be time to get the buckwheat in good condition for the wheat. But if you think the ground really requires the buckwheat to help it, the disadvantages of plowing it in may be avoided by spreading quicklime upon the surface as soon as the buckwheat is plowed in and thoroughly harrowing the ground. Then the ground should be rolled to pack the soil and again harrowed to mellow the surface just before the wheat is sown. This will produce the proper condition for wheat, viz decomposed and mineralized plant-food, a compact bed for the seed and a mellow soil on the surface above the seed; the necessary absence of weeds will also be secured. 2. Barley turns yellow from various causes; too much wet or too dry a state of the soil; an excess of heat; the attacks of the Summer brood of the Hessian fly and want of sufficient fertility in the soil; which of these causes is at work can only be discovered by a study of the particular circumstances in this case.

Hedge Plants for the South.

G. S. H., Austin, Texas, asks, 1, what deciduous hedge plants make the best ornamental hedge for city grounds in that climate; 2, what evergreen; 3 what is the best time to gather the seeds of evergreens, such as Arborvitæ and Red Cedar; 4 should they be gathered while the seed pod is green; 5, what is the best time to plant them.

ANS.—1, Of deciduous hedge plants, the Osage Orange and some species of Cratægus (Thorn) would probably be best adapted to your latitude. 2. For evergreen hedges, there is nothing superior to Euonymus Japonica. It grows rapidly, and is very vigorous and hardy and takes the shears well. The bright, glossy leaves make it one of the most desirable. The Tree-box is also very ornamental and in a rich, moist soil makes a fine hedge. The Red Cedar and Arbor-vitæ are also used with fine effect. 3 and 4, Seed should be gathered only when fully matured. Those of Arbor-vitæ when about opening the cones; those of Red Cedar about mid-winter. The latter should be allowed to dry off the resinous pulp before sowing; or, what is still better, collect, under the trees, the seeds which have passed through the crops of birds. 5, Plant in early Spring, in a somewhat damp and shaded place and cover lightly with a mulch of rotted leaves, to keep the surface damp and prevent the young plants from being scorched by the sun.

Forcing Strawberries.

L. F., Columbus, Ohio, asks, 1, whether a small, tight shed at the back of the house, with windows at the east and west sides, would do for forcing strawberries in Winter if heated by the passage through it of the flue from the stove in the kitchen and hot water pipes connected with "back of the stove;" 2, is it better to plant the strawberries in troughs or crocks.

ANS.—1, A shed at the back of the house, with windows only on the east and west ends, would *not* be a suitable place for forcing strawberries in Winter. Nothing less than a *glass roof* would meet the requirements of the strawberry. It might be heated very well by hot-water pipes connected with a water-back in the kitchen range or stove. A hot-air flue would be a very dangerous thing to use in a house attached to the dwelling. In anything you do in this way you must keep in mind that the strawberry is not an easy plant to force, and involves a good deal of trouble, especially if you want the fruit very early. 2, Pots will be better for you.

Blue Grass.

"Subscriber," Huntingdon, Pa., asks whether Kentucky Blue Grass would be likely to thrive in that latitude; the best time to sow it; how much seed should be used per acre, and what would be the yield and quality of the hay.

ANS.—Yes; it thrives well even farther north. A very decided advantage, not sufficiently dwelt upon, which this grass possesses over many others, is that though eaten off close to the ground it is not seriously injured, but soon springs up fresh and green. This is often called at the North "June Grass." It may be sown in early Spring or early Fall—or upon the snow in Winter. Sow broadcast at the rate of one bushel per acre, and harrow lightly. During the first year stock should not be permitted on the field. The next year it may be pastured as soon as the seed stalks show themselves. It is not suited for cultivation where short rotations are followed. The yield is light compared to Timothy and to many other grasses, though the herbage is fine. For hay it should be cut while in bloom. It is less nutritious than Timothy.

Treatment of Clematis.

H A., Georgetown, Mich., asks, 1, whether a covering of straw in Winter would benefit perennial flowers; 2, how to propagate clematis; 3 where can seeds be bought.

ANS.—1. Straw would have the effect of preventing the frost from heaving the ground, while successive freezings and thawings in extremes of weather would effect less harm. 2, The improved varieties of clematis are best grafted upon some of the strong growing species. Cuttings, however, of the half-ripened wood root quite freely. They may also be propagated, of course, by layering. They should be layered now. 3 Many of the seedsmen sell clematis seeds. They do not germinate freely—some requiring to lie in the soil two years.

Miscellaneous.

G. L. M., Lodge, Ill., has sprouted some 1 200 peach seeds and they are growing in a nursery, being now about a foot high. Wishing to bud them in September and plant them in the orchard a year from next Spring, he asks whether the following varieties would be good to bud on them, as he wishes to have half a dozen good sorts: Alexander, Crawford Early and Late, Foster, Old Mixon Free and Old Cling, Downing and King of Chester.

ANS.—We do not know anything about King of Chester. Downing is a new peach originating in Penn. It resembles Amsden and Alexander, ripening about the same time. It is of fair quality. We doubt if Foster will succeed in Illinois. Old Mixon Free and Cling will probably thrive well there—Alexander and Crawford's Early and Late moderately well.

A Subscriber, Lewiston, Me., asks, 1, what sort of grapes are the Niagara and White Hall; 2 when to plant the tips of Gregg and Caroline Raspberries.

ANS.—We do not know the White Hall. The Niagara is a productive white grape, ripening after the Hartford Prolific. Do not think you can purchase vines at present. 2. The tips may be covered in August and September.

I. F. W., Platte City Mo., asks the best way to kill out Red Clover which grows in the Court-house square, but for which it is desired to substitute Blue Grass.

ANS.—The blossoms must be cut off for two or possibly three years.

H. S., Bainbridge, Mich., says that from the seed sent out by the RURAL a small tree is growing, and he wishes to know whether it is a locust which it resembles.

ANS.—We have never sent out any locust seed.

J. W. C., Hillsborough, Col., asks when must competitors for the RURAL wheat premium make their entries.

ANS.—Any time before August the first—or a little later.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JULY 16.

ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, JULY 23, 1881.

All advertising copy for the Fair Number must be received by August 15.

Our next portrait will be that of Dr. James Bennet Lawes, of Rothamsted, England. Several years ago the Rural presented a portrait of this distinguished scientist and farmer; but it was not satisfactory. The next thereafter will be one of his associate, Dr. J. H. Gilbert.

It is, we judge, quite too much to say that the pollen of the tassel of a green stalk of corn never fertilizes the ear of that stalk. This is undoubtedly true of some kinds, but not of all. We find that several varieties of sweet corn now growing at the Rural Farm are self-fertilizing—that is to say, that the pollen is ripe at the same time that the silk is ready to receive it upon the same plant.

A Day of Thanksgiving.—In response to suggestions of Gov. Foster of Ohio, that a day of general thanksgiving be observed for the recovery of the President, as soon as the happy event shall be definitely determined, the Governors of nearly all the States and one Territory have, up to this writing, signified their hearty approval. If the President shall finally recover, as now seems probable, the whole land will unite in heart-felt thanks to the Ruler of nations for having spared to ours the man in whom, as President, are centered the affections of a great people. Such a day will unite more firmly all individuals, organizations and States, and will show to other lands that we, the youngest nation, have based our hopes for the present and future of the Republic on no uncertain foundation.

Some more stringent laws should be passed for the protection of farmers living near towns and cities from the depredations of Sunday excursionists. Besides the unseemly uproar created on the Sabbath in quiet country places by these unwelcome visitors, many of them consider it the chief part of their legitimate "fun" to injure fences, destroy flowers, chase or pelt cattle and other stock, rob fruit gardens and orchards, and make themselves nuisances generally. Of course, there is no objection to the denizens of crowded cities seeking health and fresh air in the open country whenever they have an opportunity, but at the same time restraint should be placed on the vagaries of many of them, who seem to think the wide freedom of the country means license to mischief. They, like others, should be taught that the rights of one man end just where those of another begin, and that dwellers in the country have some rights which even the rabble of the cities are bound to respect.

Hungarian Grass.—We have always heard that Hungarian Grass needs a good, if not a rich, soil; that it should be sown late, and that if the ground is either too wet or too dry at the time of sowing, the grass will fail. On May 12 we sowed it upon a twentieth of an acre of poor soil, without manure. It was plowed and harrowed—the seed covered with a rake. This grass is now in bloom and we are cutting it for chickens and horses. Another plot of two-fifths of an acre was sown upon similar land, with 100 pounds of "Soluble Pacific Guano," May 24. Of this we shall speak later. Hungarian Grass is valuable in many ways. As a green manure it would seem to be especially valuable, as two crops could be turned under in one season. All stock are extremely fond of it. It tillers freely, though the roots grow near the surface and take so feeble a hold upon the soil that the plants are readily pulled up by hand. We are merely giving our first impressions of Hungarian Grass, never having raised it until the present season.

THE RECALL OF CHINESE STUDENTS.

It may not be known to all that there have been, for the past few years, several Chinese students in some of the American colleges, but such is the fact. Yung Wing, who is as thoroughly American in education and habit as one born out of the country can be, saw how, in the education of his countrymen, he might bring his race to a much more advanced civilization both in national and religious matters. But this purpose he did not reveal to his home Government, nor did the high functionaries there suspect that a few years' education of young Chinamen here would so liberalize them and imbue them with a spirit essentially American. However, the action which the Chinese Government has recently taken in recalling the students and abolishing the Chinese Educational Commission in this country, has been under consideration for several months, and probably arises out of a fear that the progress made by these students, outside of the educational advantages proper, will not be to the advantage of the future of China. It is a wonder that this system of education should be allowed to run so long, but the Chinese Government has not until now fully realized the meaning of having Chinese youths educated in a country where social and political notions are at variance with those of the Celestials. But it is a compliment to our educational methods and to the civilizing and progressive spirit of our institutions that the Chinese Government should have taken this decisive step, if, as is possible, the cause for the action lies in the fears they entertain for the non-progressive, arrogant policy of the ruling classes in China.

STORAGE FOR CEREALS.

In all the great receiving centers of cereals much inconvenience and not a little loss have of late years been caused by insufficient storage capacity in late Fall and early Winter, when the bulk of the crops is hurried to market. San Francisco, Chicago and Baltimore were conspicuous in this respect last year, and the trouble was also felt, though less grievously, at Philadelphia, New York, Milwaukee, St. Paul and St. Louis. In some parts of the country, especially of the West, farmers, however hard pressed, found it impossible, sometimes for weeks, to sell their grain, except at a sacrifice, because all the storage room at the termini of the railroads and at the local stations was over-crowded. The production of the country had outrun the capacity for handling the products. Owing to the probable diminution of the aggregate yield of cereals this year, and to some late enlargements of the storage room in most of the above cities, the risk of similar trouble this year is generally less than last. The grain trade of St. Louis, however, has so greatly increased within the twelvemonth and is likely to increase even more rapidly in the course of the next six months, that there is great danger of a grain blockade at that city and of consequent trouble in the tributary country. Foresight in matters of this kind is very needful for the welfare of any place. Owing to the blockade at Baltimore last Winter not a little of the grain traffic that would have gone to that point, went elsewhere and took with it much trade that would have cheered the hearts and added to the profits of the merchants of the Monument City; for the market in which products are sold, is chiefly that in which goods are bought. A dozen years ago a prominent merchant of St. Louis, in answer to the inquiry "What is the great need of your city?" replied, "Half a hundred first-class funerals." From the increased energy and enterprise lately shown there, it is not unlikely that a few of the somnolent, wealthy old fogies who were content "to let well enough alone," have since been buried in first-class style, but a good many more similar funerals seem to be still necessary for the proper development of the trade of a city so advantageously located. A dispatch just received announces, it is true, that the construction of an elevator of 1,000,000 bushels capacity is to be begun this month, but it will not be completed in time for this year's trade—and it is to be built by Eastern enterprise and capital. Moreever, just across the Mississippi on the Illinois side, the capacity of the elevators is to be doubled rightaway, giving an additional storage capacity of 3,000,000 bushels of grain.

GENEROSITY, NOT "GUSH."

According to this morning's Washington telegrams, President Garfield may now be said to be "out of danger," although it may be many weary weeks or months before he will be able to "feel himself again." There is no doubt but that the dastardly attempt on his life has given him a much stronger hold than he previously had upon the affections of the American people, and thus increased his chances of that re-election which has been the ambition of all those who have once been elected to the presidential office. Whatever may be the outcome of this ambition, certain it is that an unusually prosperous career lies before Gen. Garfield. In the first excitement of his danger a movement was started in this city to raise a fund of $250,000 for Mrs. Garfield, as the apprehended death of her husband would leave her and her family, it was understood, in not very affluent circumstances. At first, while the President's life was in imminent danger, contributions poured in rapidly, but later on, as his recovery advanced, the donations grew fewer and smaller, so that although upwards of $100,000 were spontaneously promised the first day or two, not half that sum has since been obtained even by solicitation. It is certainly desirable that the families of the Chief Executives of the Republic should be placed beyond risk of want, or even the need of close economy, and therefore we heartily support this provident movement. Mrs. Garfield, no doubt, is a very estimable lady, and her conduct as mistress of the White House has been admirable both before the attempt on her husband's life and during the trying period when that life hung in the balance. Many people, however, gushingly insist that her attention to her wounded husband deserves this recognition of national gratitude, as something grand and exemplary. While fully alive to the high merits of Mrs. Garfield as a wife, however, we cannot see anything exceptionally noble in her conduct, in view of the fact that there are tens of thousands, aye, thank God, hundreds of thousands of other American wives who would be equally devoted to their dying husbands stricken down by an assassin's treacherous hand. How many devoted wives, in all parts of the country, faithfully and lovingly watch over their ailing husbands without the encouragement of public commendation, and often even without the ordinary conveniences of a sick room, and that, too, although the husbands, unlike our wounded President, are anything but patient in their suffering, and frequently have done nothing in their previous lives to win the admiration of their wives. By all means let Mrs. Garfield have this money, if there is a probability that she will ever need it, but for the honor of American women, do not insist that there is anything exceptionally fine in her conduct, noble as it undoubtedly is.

OUR FOREIGN MEAT TRADE.

To every owner of live stock in this country there are two important questions with regard to our export trade in live stock and dressed meats—will the traffic be continuous and are there other countries which from their position, soil or climate, may compete closely with us in supplying the European markets. From some elaborate statistics lately compiled by Dr. Von Neuman, it appears that since 1850 the number of food-animals has actually decreased in Great Britain, France, Austria, Italy, Belgium and Switzerland, while the population has been steadily increasing in all these countries; and the increase of food animals in the other European States is only sufficient to make the increase for the whole of Europe less than two and-a-half millions of cattle, sheep and hogs during twenty-five years.

In some countries, however, the actual decrease in the number of food-bearing animals, does not show the proper decrease in the amount of meat food, for, in these, breeding has received so much attention that the average weight per head of the animals is considerably greater now than formerly. For instance, in France oxen have increased in weight 21 per cent. since 1840; calves, 40 per cent.; and sheep 50 per cent.; but outside France and England few people have obtained such valuable results from breeding for meat. When the number of animals, however, is compared with the number of people at different dates in the present century, it is seen that the amount of meat pruduced per head has assuredly decreased. The following table shows the population of Russia, Austria-Hungary, France, the United Kingdom, Germany, Spain, Italy, Sweden, Norway, Holland, Belgium, Denmark, Switzerland and Portugal at various dates and the number of cattle, sheep and hogs, per thousand, of population:

Years.	Pop. of States.	Number of animals per 1,000 pop. Cattle.	Sheep.	Hogs.
1832, about	215,000,000	328	764	197
1857, "	244,000,000	355	724	166
1869, "	278,000,000	331	700	152
At the present time	294,000,000	310	682	156

As the years have gone by the people there have been consuming less and less meat, not because their taste for it has changed, but simply because its growing price has put it beyond the daily reach of the laboring classes, and forced even the moderately well-to-do to be sparing in its use. With the advent of cheaper meat from this and other foreign countries, however, the demand for beef, mutton and pork must continue largely to increase, benefiting the native population by the use of a more nutritious diet, and foreign countries by insuring for them a permanent market for their surplus meat-bearing stock.

The number of food-animals in this country in proportion to population is far away greater. For every thousand of our population, in 1878, there were 653 cattle, 764 sheep and 690 hogs, an enormous difference over the European ratio, except as regards sheep, and the high average of these across the Atlantic arises from the large numbers in Denmark, Servia, Roumania, Spain and Greece, where the wool is of more importance than the meat. It is evident, therefore, that the United States is well able to furnish a large supply of meat to Europe at present, and it has ample range and capacity for greatly increasing its surplus, but what is the prospect of other countries competing successfully with us in the trans-Atlantic markets? South America, and the Southern colonies of Australia seem admirably adapted to cattle raising, while Servia, Roumania and Austria-Hungary export large numbers of food-animals to neighboring countries, and northern Africa furnishes France with large amounts of meat. As in cereals, however, Russia is our strongest rival, and were it not for the dense stupidity of the lower orders, the mismanagement of the government and the undeveloped condition of the country's resources, there is no doubt but the Empire of the Czar would prove a very formidable competitor. The latest comparative statistics are those of 1877, and these give the following figures of the trade in meat, according, to a late issue, of Bradstreet's:—

VALUE IN DOLLARS OF EXPORTS.

	Live animals.	Meats.	Total.
United States	$4,498,000	$69,759,000	$74,257,000
Argentine Republic	3,173,000	2,724,500	5,897,500
Australia	.....	2,157,750	2,157,750
Uraguay	557,250	1,903,750	2,461,000
Russia	12,658,000	2,335,750	14,993,750
Roumania	4,975,500	.....	4,957,500
Austria-Hungary	1,696,325	28,750	1,728,075
Servia	4,511,750	.....	4,511,750

Since 1877 our cattle and meat exports have largely increased, but even then it is seen that we controlled two-thirds of the export trade in meats, and, considering our favorable position, our vast commercial relations with Europe, and the energy, ingenuity and goaheadativeness of our citizens, there is no reason to fear that, in the absence of hostile legislation, we shall lose any of our hold on our foreign meat markets. Let us, therefore, be still more earnest in following the admirable example of France in improving our stock by careful breeding and judicious management, certain that an assured reward awaits us.

BREVITIES.

Three bushels of buckwheat for seed to the acre, as stated in last week's Rural Brieflets, should have been *pecks*.

Of the 13 different kinds of sweet corn growing at the Rural Farm, Early Narragansett and Minnesota were the first to bloom and to set ears. Planted May 9, the sets were in silk July 10. Our tests with these kinds of sweet corn are being made in rather a poor soil without manure. Moore's Early Concord was the third to bloom viz., July 15.

Dr. Loring, Commissioner of Agriculture, we are informed, has not yet definitely decided to discontinue the Departments' experiments in tea culture. He is about to send Mr. Saunders, chief of the horticultural department, to South Carolina to make a thorough investigation of the question and to institute an examination of the tea farm established there by Gen. LeDuc. The future action of the Commissioner on tea culture will depend on Mr. Saunder's report. As the Department has about 140 acres of sorghum growing and a cane mill of sufficient capacity to test the practicability of sugar-making from sorghum as a profitable industry, experiments in this direction will be continued at least for the present year, with the aid of experts in the business from Minnesota, Missouri, Kansas and Illinois.

During the past week there has been a very severe cutting down of the passenger rates on the great trunk railroad lines to the West, and freight rates have largely shared in the reduction. From Chicago to New York rail freights have been as low as from 12 to 16 cents per 100 pounds, and rates from the other chief centers in the West have been correspondingly low. The rates by the lakes and canal from Chicago to this point are 8 to 8¼ cents on wheat per bushel of 60 pounds, and a shade less on corn per 56 pounds. It will, therefore, be seen that just now competition between the railroads has lowered rail rates as low as those by water, or even lower. Ocean freights on grain closed here on Friday at 4½d. per quintal by steam to Liverpool; 5½d. for Glasgow.

Miscellaneous.

WHEAT CULTURE IN MINNESOTA.

The Resources of the Red River Country.

MESSRS. HOLMES AND SWEETLAND,

[Special Correspondents of the RURAL NEW-YORKER.]

It has been well and truly said that a person should know his own country before visiting foreign lands. Thousands of people annually make the trip to Europe and wander about with an aspect of freshness, with gaping mouths and extended eyes, as if there was nothing in the world so attractive as those close, crowded old cities, those worn-out fields and ancient ruins. They put up with every description of discomfort to be in the fashion, and when questioned about their own glorious country they are either forced to acknowledge their utter ignorance of its extent, its capabilities and its attractions, or, if unwilling to make so humiliating a confession, they talk the baldest nonsense, usually betraying their ignorance to auditors better informed, although foreigners. Their knowledge of this country is confined to the eastern portion of the Union, and while they may go into raptures over the wonders of Niagara, the efficacy of the waters of Saratoga Springs or the splendors of the Eastern mountains and the sea-side—forgetful that the Old Country has higher mountains and as attractive a seashore—they can scarcely answer the most natural questions of foreigners who desire, of course, to know of the great new country in the West.

A proper preparation for a European trip would be a journey to the rapidly developing West which is becoming so important a factor in the commercial economy of the world. After an intelligent inspection of the newest part of the New World, a traveler would go abroad with a sense of his importance as an American citizen, proud of his land and anxious to be interrogated in regard to it. The people of the Old World, anxious to learn of this country, naturally expect to derive full and reliable information from its citizens, hence the great throng of tourists have splendid opportunities to perform efficient missionary work, if they have properly prepared themselves by observation or study.

Again, there are superficial observers who rush through the country in an elegant palace car and laugh and joke about the unfinished villages, the unfenced farms and the vast extent of untamed prairie, without obtaining any important facts. On their returning they talk or write with affected wisdom of the Far West. It is a reflection on the sagacity and intelligence of editors that such people should be allowed to air their ignorance in print. In the February number of Lippincott's excellent and usually reliable magazine, a lady who undertook to give an account of the Red River country, stated that the famous wheat farmer, Oliver Dalrymple, had over 6,000 acres in wheat in 1880! And sagaciously predicted that in the course of time the Northern Pacific Railroad might find sufficient traffic to keep it busy. Dalrymple had over 22,000 acres sown, and harvested and marketed nearly 500,000 bushels of splendid wheat in 1880. The Northern Pacific Railroad already finds it difficult to accommodate its traffic and with the rapid development in progress, a double track road across the great wheat belt will be required in the near future.

THE STORY IS NOT LONG,

and it won't take a great while to read and learn it. But little more than ten years have elapsed since the first locomotive made its way westward from longitude 92 degrees, north of latitude 46. Northern Minnesota was then only inhabited by lumbermen, who were dependent upon the more southern part of the State for every necessary. Northern Dakota was an almost unknown country, soldiers, trappers and hunters crossing it by a regular trail as rapidly as possible, little thinking how soon a great empire was to spring up on those immense prairies.

The Northern Pacific Railroad has steadily wedged its way onward to the Missouri River, and the railroad company acquired from the Government the odd sections in a belt of land 450 miles long and 40 miles wide in the State of Minnesota and 80 miles wide in Dakota Territory. In 1872 there were less than 2,500 inhabitants on the line, and they were all in the extreme eastern portion of Minnesota. There were not then over 1,000 acres under cultivation through the entire region. What do we find now?

From 1871 to 1875 the population on the line in Minnesota increased from 2,064 to 21,106, and at the close of 1880 we find 48,939. From 1,000 cultivated acres in 1870 the area increased to 58,150 acres in 1875, and in 1880, 232,992 acres were cropped in the Minnesota district. The great Dakota plains were avoided by settlers until 1875, when a successful experiment in wheat raising made by Mr. Oliver Dalrymple, 20 miles west of the Red River, demonstrated the wonderful producing value of the land, and settlement and improvement followed fast. The successful working of a single section—640 acres—of land in 1875 proved the inauguration of the greatest wheat district of the world; for last year there were 273,000 acres in the crop, and the population west of the Red River had grown to over 35,000 people. To recapitulate: In Minnesota and Dakota, on the line of the Northern Pacific Railroad between Lake Superior and the Missouri River, the area—

	Acres.
Under cultivation in Minnesota, 1880	232,992
" " " Dakota, 1880	273,000
	505,992
New breaking in Minnesota, 1880	67,049
" " " Dakota, 1880	127,000
Total area now (1881) in crop	699,041

Allowing that 10 per cent. is devoted to other than wheat culture, and assuming the low average of 20 bushels [Is this a low average?—EDS.] to the acre, the wheat crop from the line of the railroad will this Fall be over 12,600,000 bushels. The increase is just about 50 per cent. each year in population, cultivated area and number of farms. This ratio of increase has held for the past five years since the Dakota plains were opened, and, should the rate continue, the 30,000 square miles of land on the line, which are known to be capable of raising the

FINEST SPRING WHEAT IN THE WORLD,

will in eight years be entirely under cultivation, taking the present tilled area, about 1,200 square miles, as a basis. Allowing liberally for the cultivation of crops needed for home consumption, we find that, by the most conservative calculation, the country in Minnesota and Dakota on the line of this great highway—only about one-sixth of the length of the road when completed—can and probably will supply to the world within the coming decade 340,000,000 bushels of wheat! Is there anything visionary about a double-track road in the near future?

It is impossible at this time to give an idea of what the increase of population will be this year, but the tide of immigration is pouring in in a perfect flood, and the indications are that it will exceed the 50 per cent. rate mentioned. From actual investigation it is, however, known that an increase of fully 50 per cent. has been made in tillage, the amount of breaking done varying from 25 per cent. in the old Minnesota districts to 100 per cent. in newly opened portions of Dakota. This gives us not less than 1,000,000 acres for wheat in 1882, sure to yield 20,000,000 bushels of the golden grain! This amount of wheat will make 67,000 car-loads and the road will earn over $5,000,000 by its transportation at the lowest rates. One-half of this wheat belt devoted to wheat would produce enough to afford every inhabitant of the United States four bushels of wheat annually—about the average amount consumed in flour by each individual. The traveler here will find on every hand health and contentment, in fact, very general prosperity. Poor men who have passed through sufferings and privations, have here found comfort. Industry reaps a sure reward and enterprise and capital are quickly remunerated.

From Duluth westward for about 175 miles the country is heavily wooded, thus affording an ample supply of lumber and fuel for the prairies beyond. The production of lumber is probably 200,000,000 feet per annum and it is delivered to consumers westward at reasonable prices.

Beyond the timber country comes the beautiful Park Region which is dotted with charming lakes, and splendidly diversified by natural groves and rich, fertile prairie openings. This region merges into open prairie as it reaches the Red River, and the famous wheat country begins, continuing over the level and upland prairies to the Missouri River slope 200 miles beyond, and extending far northward and southward. The wheat grown through this vast territory is acknowledged to be without an equal, so that it was found necessary to establish a special grade for it, hence the title No. 1 HARD. Millers admit its value to be at least 25 per cent. more than other wheats, and consumers in all parts of the world anxiously seek the pure, sweet flour produced from it. All of the conditions favorable for the production of the finest wheat are found here and never since the wheat culture was commenced has there been a failure of a crop. Insects, drought and blight, the remorseless enemies of other western districts, are unknown and thousands of disappointed, weary settlers, who have been deluded by the glittering promises made for States and Territories further south, have deserted their farms where they hoped to find a home and prosperity, and with their wives and little ones driven where their dreams stand a better chance of realization. Such pilgrims can be found throughout this country, and the testimony they give in favor of their new-found homes is often so extravagant and enthusiastic, that it would scarcely be believed if published. That little fear exists of the exhaustion of the soil for years to come may be understood from the fact that lands in the Red River Valley, broken 25 years ago by the Hudson Bay Company have been cropped each year since, and are even now claimed to be *too rich!*

A writer, than whom few men are more familiar with this great Northwest says. "The soil on the great Dakota plains is a rich, black, vegetable mold, varying from two to six feet in depth and underlaid by clay in stratum. It is so easily worked that the cultivation proves truly restful to the Eastern farmer. The soil contains in itself the most valuable ingredients which can be selected to produce fertilizers, and the clay subsoil holds the moisture derived from precipitation, at the command of the growing crops. The seed is sown usually about April 15th and the harvest commences about July 20th. The showers are most frequent during the growing season in May and June; and are seldom known during harvest. The nights are short, thus giving the growing wheat the benefit of almost constant sunshine. But it is not alone for wheat that this rich land is adapted. Every production of the most prolific northern countries grows here in perfection and profusion. Wheat yields 20 to 30 bushels per acre; Oats from 40 to 75; barley from 40 to 55; potatoes 200 to 400 and all other crops are equally abundant. Vegetables and small fruits are as fine as those raised in any land and grow to enormous size."

The climate of this region is salubrious and healthful. The atmosphere is clear, dry and pure, devoid of moisture and possessing a healing power which few others possess. The cold of Winter is greatly modified by the dryness of the air, and is much more easily endured than a penetrating atmosphere saturated with saline dampness, which destroys or debilitates the residents of places in the same latitude, but nearer the Atlantic coast. In this land of plenty where the cultivation of the soil returns a sure profit, the Northern Pacific Company has nearly 3,500,000 acres of land for sale at $4 per acre cash or preferred stock on six months' credit, and a rebate of 25 per cent. is made on every acre broken within two years of purchase.

Between the Missouri and Yellowstone Rivers lies a country as yet but little settled where the agricultural lands belonging to the railroads are open to selection at the government pre-emption price of $2.50 per acre, with a charge of 10 cents per acre for surveying. This country differs from Eastern Dakota, being of a more rolling character having hills and buttes and is watered by numerous small streams, all tributary to the Missouri River. The country is as well adapted to the production of all crops as that described, and on account of its hilly character it is peculiarly adapted to the raising of stock, the valleys affording shelter and the grasses are abundant as well as of the most nutritious kinds. By the construction of the railroad through this territory the Northern Pacific Company acquires over 5,000,000 acres of land, the greater portion of which is desirable. One great advantage possessed by this region is an excellent quality of coal which appears to underlie it throughout its entire extent. Two mines are already being worked, and the coal finds a ready market on the line of the road. Thus we find the great treeless prairies of Eastern Dakota providentially provided with fuel, the wood of Northeastern Minnesota and the coal of Northwestern Dakota being supplied at reasonable prices. The Missouri Division of this railroad terminates at the Yellowstone River whose broad, beautiful valley is described as the most attractive and fertile on the continent; but space is too limited to enlarge upon it. The road is being rapidly built along its banks, and, before another Winter will stretch its iron rails far up the valley. Several thousand men are required for the work and many immigrants coming here secure employment, giving themselves ample time to secure a good location and become acquainted with the country.

There is no question that this region will become at no distant day a busy hive of civilized industry, and it should not be forgotten that besides the R. R. lands there are millions of acres of government lands open to citizens of the United States, the only cost to the settler being the fees of the U. S. Land Office.

The headquarters of the Land Department of the Northern Pacific Railroad are at St. Paul, and your correspondents must acknowledge courtesies received from Col. R. M. Newport, the General Land Agent of the company.

Literary Miscellany.

LIFE'S TRUE SIGNIFICANCE.

DEEPER than all sense of seeing
Lies the secret source of being,
And the soul with truth agreeing,
  Learns to live in thoughts and deeds;
For the life is more than raiment,
And the earth is pledged for payment
Unto man for all his needs.

Nature is our common mother,
Every living man our brother,
Therefore let us serve each other;
  Not to meet the law's behests,
But because through cheerful giving
We shall learn the art of living;
  And to live and serve is best.

Life is more than what man fancies!
Not a game of idle chances:
But it steadily advances
  Up the rugged hight of time.
Till each complex web of trouble,
Every sad hope's broken bubble,
  Hath a meaning most sublime.

More of religion, less profession!
More of firmness, less concession;
More of freedom, less oppression,
  In the Church and in the State;
More of life and less of fashion;
More of love and less of passion:
  That will make us good and great.

When true hearts, divinely gifted,
From the chaff of error sifted,
On their crosses are uplifted
  Shall the world most clearly see
That earth's greatest time of trial
Calls for holy self-denial,
  Calls on men to do and be.

But forever and forever
Let it be the soul's endeavor
Love from hatred to dissever,
  And in whateo'er we do,
Won by love's eternal beauty,
To our highest sense of duty
  Evermore be firm and true.

MY EXPERIENCE.

Continued from page 475.

"You will make her happy now," Mabel says, with a faint, wraithlike smile. "Never let her know—there is no need that she should. I think we need not say any more now," she adds, holding out her hand to him. "Believe me, it has been all for the best."

"I cannot accept such a decision," he says, hurriedly. "Mabel, have you no pity for me? I love you—I love you!"

"Hush!" she says, quickly, "I must not listen."

"Mabel—in pity——"

"It is for you to have pity," Mabel answers. Oh, Cyril! leave me now."

He stands hesitatingly before her; in a moment turns away, turns to her again, puts her hands in his, and presses them passionately to his lips; then releasing them, he turns away once more and leaves the room. Mabel stands for a moment where he has left her; then she holds out her hands with a little faint cry of pain, gasps for breath, and before I can get to her assistance she has fallen back into her chair in a dead faint.

CHAPTER III.

Mabel's fainting fit is not of long duration; only a few moments elapse before she opens her eyes, looks bewildered for a moment, then smiles faintly and says she is better—that it was very foolish of her to faint, but the heat makes her feel languid and weak.

I accept the explanation without seeming to doubt it, and induce her to go up to her room and lie down; and when she is lying on her bed, with her face turned away from me, I sit down in the old-fashioned window-seat, and for the first time in my sunshiny seventeen years of life think long and seriously.

Everything grows very plain to me now, and much that has seemed incomprehensible to me in my sister's past life is explained.

It had always puzzled me why Mabel—so beautiful, so accomplished, and so sweet—should have lived to pass her eight-and-twentieth birthday unwon; not unwooed, for she had had several good offers, but she had refused them all firmly and decidedly. Sometimes I had thought that she had sacrificed herself to us, motherless bairns as we were, but at others I felt sure it was not so; for Aunt Bessie, my mother's sister, could and would have taken her place, had she gone to make the sunshine of another home.

That Mabel was too essentially a woman to pass her life without love I was sure; but whenever I had touched upon the subject to her, she had always silenced me calmly and decidedly. I had heard some of our old friends say how much quieter Mabel was than she had been; but she had never seemed depressed, and I had never thought there was any special reason for that quietness of manner. She had always been quiet within my recollection, and I supposed it was natural to her.

Darling Mabel! how my heart goes out to her as I watch the quiet form on the bed, and listen to the faint, uneven breathings, for she is agitated still and tears are very near. Presently I see that her face is hidden in the pillows and I know from the movement of the shoulders that she is sobbing. I do not go near her, and smile a little as I think how happy I shall make her by-and-by, for there is no doubt in my mind as to what course I am to pursue. Mabel, who was ready to sacrifice her happiness to me shall be made happy with the man who has loved her and whom she has loved so long and faithfully.

Although I do not love Cyril—although I know perfectly well that the affection I feel for him is not the love a woman should feel for her husband—there is a sharp pain at my heart when I think of him.

"He had no right," I say, bitterly, "to allow me to think that he loved me, when his whole heart belonged to another. I feel as if he had tried to rob me of something great and precious which was mine by right. He had cared for me, not for myself, not for my beauty—for I am pretty—only because I resembled Mabel. It was not right—it was not fair. I felt very angry with Cyril when I thought of it—angry, and yet sorry, for all those long ten years which might have been so happy and were so miserable."

But mingling with that anger there was an undoubted sense of relief, which proved to me plainly how wrong it would have been to marry Cyril Vernon. More than once during our short engagement it had seemed to me as if I were bound by chains which should have been pleasant and which were irksome. More than once my heart had sunk at the prospect of a long life spent with my *fiance*. We had no tastes in common, and I soon felt that what I had taken for real pleasure in my engagement had been gratified girlish vanity at attention from a man so handsome, so distinguished and so thoroughly eligible a *parti*. It was not my heart, only my fancy, which had been touched, fortunately for me. Neither was it a case of "sour grapes," for, careless and frivolous as I was, I yet could recognize how great and precious a gift was the love of such a man as Cyril Vernon.

The long Summer day wears on; neither Mabel nor I go down to luncheon, and the afternoon slips by. I take a book from Mabel's little bookcase, and try to read, but I find my thoughts wandering. My sister lies still, her face hidden; but she is not crying, neither is she asleep. Presently papa and Cyril go out together—the former talking as they go down the garden-path, and the latter, listening and answering absently I feel sure, looks pale and grave, even sad. Soon after they have disappeared down the high road the schoolroom tea-bell rings, and Mabel lifts her head from the pillow, and raises herself on her elbow.

"Half-past four," she says, trying to speak lightly. "I have wasted the whole day. What shocking indolence! Have you been here all the time, Gracie? How good of you, dear!"

"Are you better, Mabel?" I ask, as I go to her side and smooth back her pretty disordered hair. "Shall we have some tea up here cosily? And after tea you shall dress comfortably for dinner."

"You will spoil me, Gracie," she says, smiling; but she makes no opposition, so I ring for tea, and settle her comfortably in a large old-fashioned chintz-covered chair by the open window, thinking sorrowfully how very pale she is, and what dark circles, almost like bruises, that one day's unhappiness has traced round her sweet dark eyes.

When tea is over, and I am sitting on a stool by Mabel's side, with my head resting against her knee, there is a moment's silence. I am puzzling myself how to begin, and Mabel is looking out of the window with "far-away" eyes, as if her thoughts were far away from the present, and lost in the past.

"Mabel!" I begin, desperately, at last.

"Well, dear?" she answers, with a little start, and turns to me with her own sweet, sad smile.

"I have something to tell you," I stammer, then go on hurriedly. "I want—do you think it will

be very wrong?—I want to break off my engagement."

"Gracie!"

"Are you dreadfully shocked?" I ask, lightly. "Really and truly, it will be the best thing for me to do. I do not love Mr. Vernon, and I do not think it will break his heart."

And then, without giving her time to speak, I pour out a voluble explanation. I plead my youth and inexperience, and tell her, with perfect truth, that I find that I have completely mistaken my feelings for Cyril. The engagement has been such a short one, and has been kept so quiet, that no one need know of it, and I end my explanation and excuses by asking her to tell Cyril.

But Mabel shrinks back.

"No, no," she says, hurriedly; "papa will tell him, if indeed you have decided; but, Gracie, have you really considered this well? Have you quite made up your mind? Do you know what a great treasure you are casting away? Do you know how happy you would have been? Dear child, think well. We, who love you, could wish you no happier fate than to be Cyril Vernon's wife."

"But I do not care for him, Mabel. You would not have me marry him, if I do not care for him?"

"No, dear; but——"

"No buts," I answer, gaily. "Oh, Mabel! here is papa—will you tell him, dear? He may be a little vexed with me; and while you are telling him I will go down stairs."

Papa comes in while I am speaking, and disregarding Mabel's entreating gesture, I leave them together. What passes between them I do not know; but when papa comes down, he looks somewhat moved, and kisses me without a word of the scolding I half expected to receive, and then he goes into his study, where Cyril is writing letters.

The interview between papa and his embryo son-in-law is a long one; and when they join us at dinner Cyril's face wears an expression of intense happiness, which shows me that the explanation has been ample and satisfactory, and his eyes seek Mabel's with an impassioned tenderness, which tells a tale of love few would be slow to read.

Thus it comes about that, when pleasant Summer days are nearly over, and Autumn's russet hues and golden browns are clothing trees and hedgerows, there is a pretty wedding at Easton Church. Mabel looks beautiful and queenly in her bridal robes—a far more fitting bride for Cyril than I should ever have been—while his face is transfigured with an expression of intense joy which bodes well for our dear sister's happiness.

Of course I am bridesmaid, and Jack Edmonds is Cyril's best man. Jack has passed all his medical examinations, and Cyril has asked him to settle at Vernon, where a clever, rising medical man cannot fail to make his way, and where Cyril has bought him a practice, which he whispers to me, smiling, is his wedding-present to Jack and me, while Mabel's gift is the furniture of the pretty house they have taken for us. Ah! I have let my secret out now.

Before the Summer comes again there will be another wedding at Easton Church, in which Jack and I will be the principal performers. Mabel and Cyril will be back from their long honeymoon under dreamy Italian skies then, and in my present cloudless happiness I sometimes glance back to the brief period of my first engagement, and rejoice unfeignedly and sincerely that I once played the part of eavesdropper concealed in the conservatory.—THE END.

NEW PUBLICATIONS.

Lost in a Great City. By Amanda M. Douglas. Boston. Lee & Shepard. 12mo. Cloth, $1.50.

An intensely interesting history of a semi-orphan, lost in the city of New York. It gives a detailed description of ten years of an outcast life,—bought by a desperado, and sold to a variety actor, who, by means of the severest chastisement human nature ever underwent, succeeds in developing her into an elegant dance and tight rope performer. She gets to loving her "Dick," who turns his cruel treatment into fondness and caresses,—dies and again leaves her cast upon a cold and unfriendly world. After several years of severe hardship she again enters the life of an actress upon her own independence, becomes recognized by friends who have looked long and earnestly for her, is restored to the arms of a fond and loving father, becomes an heiress and marries the man who persistently sought for her everywhere, both in Europe and America. The story is altogether well written, but at times her episodes are too much overdrawn to become real to the reader.

History of Woman Suffrage. By Elizabeth Cady Stanton, Susan B. Anthony, Matilda J. Gage. Complete in two volumes. New York: Fowler & Wells, Publishers. Price, cloth $5; sheep, $6.50.

The first volume is now published, the second will appear in due time. This is the outgrowth of an endeavor which has claimed the attention of the authors for many years, and also of many others in a more subdued manner. A faithful survey of the suffrage movement is comprehensively related. Brief personal sketches of women who have been practically interested in this work is an attractive feature. Fine steel portraits are interspersed, thus enhancing its value. A short chapter is devoted to "Woman in Journalism." The progress of woman in a general sense; State laws, and much information bearing upon matters distinctive of, as well as combining with suffrage, has received consideration. Those indifferent to its particular subject will find enough within its folds to guarantee a glance at least. Letters from distinguished authors, among them Horace Greeley and George William Curtis, have been selected for its pages.

Light and Life. For Sunday Schools, Prayer and and Praise Meetings. By R. M. McIntosh. Boston: Oliver Dilson and Co. Price 35 cts.

Light and Life has been very carefully prepared by Mr. McIntosh, and creates a very favorable impression on first sight, by reason not only of the bright, clean cut appearance of its pages and title cover, but by the unusual excellence of its contents, which have been especially chosen to give to Sabbath School teachers and scholars an entirely fresh collection of hymns and tunes, either original or selected, which will add a pleasing change to their work and exercises. The title is very apt, and the illustrated cover representing a missionary ship sailing into the harbor of a savage hamlet in the Southern Seas, is admirably executed, and is suggestive. The motto verse:

Light and Life to all he brings,
Risen with healing in his wings;
Hail, thou Heaven-born Prince of Peace!
Hail, thou Son of Righteousness!

Gleanings in the Field of Art. By Ednah D. Cheney. Boston, Lee & Shepard.

This book is written in a very pleasing style and shows much thought and research. The opening chapter is devoted to a discussion of art in general and this is followed by some 15 chapters, in which is traced the history of art from 600 B. C. down to modern times, giving us glimpses of the progressive steps, and pen pictures of the men who, like Angelo, have exalted it to its proud position. It is a book which will prove interesting to every lover of the beautiful, and will be a valuable aid to the student of historical art.

A Lesson in Love. Round Robin Series, No. 2. Boston: James R. Osgood & Co

A New York lawyer is the hero of this entertaining novel. Two women are recipients of his interest; with one he forms an engagement while his keenest interest is in the other. The striking points of the story are the manner in which the hero is disentangled from his unenviable position, and the unfolding of the characters. A famous lawsuit, rival incidents, &c., give to the story freshness and spirit.

BRIC-A-BRAC.

There was a young fellow of Milton,
Whose collar it would keep a wiltin';
The warmer he got
The freer he "swot:"
"Be jabers," said he, "I'm a miltin'."

A young lady was married in Louisville the other day, and a newspaper account of the event was headed, "Mated in May." The New York Graphic supposes that "Joined in June" and "Attached in August" will be the fate of those who come later in the season. It is to be hoped that "Separated in September" will be needed in no case.

Her lips were like the leaves, he said,
By autumn's crimson tinted.
"Some people autumn leaves preserve
By pressing them," she hinted.
The meaning of the gentle hint
The lover did discern:
And so he clasped her round the neck,
And glued his lips to her'n.

A Western writer thinks that if the proper way to spell tho is "though" ate is "eight," and boes is "beaux," the proper way to spell potatoes is "poughteighteaux."

Sweet flowers! that from your sunny nooks
Give welcome to the vernal sun!
How joyous, as each bright eye looks
Aloft, doth seem the life begun.
How eloquent ye seem of days
When lovers near your haunts will chance,
And she your dainty forms will praise,
And he up sodded cliffs will prance,
And get—much verdure on his pants.
—Yonkers Gazette.

An Oshkosh mother was remonstrating with her daughter for refusing what the former considered an eligible offer of marriage. "It's no use talking to me," exclaimed the recalcitrant maiden. "I won't never marry no man who scratches a match across the basement of his pantaloons."

ALL THE SAME.

The soap-fat man's familiar face
Is now no longer seen;
All kitchen grease finds a new place
In Oilymargarine.

Seeing is not always believing—you may see a man, and yet not believe him.

John Phœnix, the humorist, being one night at the theatre, fancied he saw a friend some three seats in front of him. Turning to his next neighbor, he said: "Would you be kind enough to touch that gentleman with your stick?" "Certainly," was the reply, and the thing was done; but when the individual thus assaulted turned round, Phœnix saw he was not the man he took him for, and became at once absorbed in the play, leaving his friend with the stick to settle matters with the gentleman in front, which, as he had no excuse handy, was not done without considerable trouble. When the hubbub was over, the victim said: "You told me to tap that man with my stick?" "Yes." "And what did you want?" "Oh!" said Phœnix, with extreme gravity, "I wanted to see whether you would tap him or not."

Wives of great men oft remind us
We may make their dress sublime:
Eighty shillings for a bonnet
Knocks a check-book out of time.

Sunday-school teachers have amusing experiences. In explaining the Gospel for the day, not long since, the subject being the "tares and the wheat," the children were much interested therein. In closing, I said: "Now, remember, the tares represent the bad people, and the wheat the good." Tommy who had been an intent listener, opened his great blue eyes and said: "Miss Jenkins, you say that the tares are the bad and the wheat are the good? "Yes." "Why." replied the practical Tommy, "its the wheat that gets thrashed; the tares don't."

Once he sang of maidens,
Sweet and jolly maidens,
Now he is a cynic,
Cynic, cross and cold;
Just because when smitten
He recieved the mitten,
He must think that maidens
Are all flirts and bold.

IT IS UNLUCKY.

To fall out of a third-story window on Monday.

To meet a red-headed woman on Tuesday (especially if you owe her anything.)

To break a $40 mirror on a Wednesday.

To dream you see red snakes or green monkeys on Thursday.

To get hung on Friday.

To lose $2 50 on Saturday.

Or to get locked up on Sunday.

Paste this in your hat.

FASHIONABLE NURSERY RHYME.

Old Mother Hubbard
Hangs in my cupboard,
Very æsthetic in tone;
What shall I wear,
When its threadbare,
And the new fashion is gone?"—Punch.

BEFORE AND AFTER.

"Women before marriage want nothing but husbands, and when they get them they want everything else," said an old bachelor. "How different it is with you," retorted a lady. "When a man gets a wife he just settles down contented, feeling that he has secured the best blessing that heaven could bestow."

THE TIME HAD COME.

THREE or four years ago when there was a grip on the potato market, there lived near an interior village in this State a farmer named Peters. He raised good crops, paid his debts, and was down on rings of all sorts. The price of potatoes kept going up and up and the old farmer was uneasy. He came into the village every evening to see how the market stood, and although he never said much it was evident that he would burst his hoops pretty soon if things continued on in that way. At length the climax came. One evening the old man and his son had a warm corner in a grocery when a citizen entered with a newspaper in his hand and said:

"This New York Daily says that the price of potatoes is certain to advance again before the week is out."

"What?" exclaimed Peters, "another advance in 'taters?"

"Yes, the Lord only knows what is to become of the poor if this potato ring isn't bursted."

The farmer arose, buttoned his old white overcoat clear to his chin, brought his fist down hard on the cheese box and sternly said:

"The time has come! I've stood it—and stood it, as long as I can, and now I'm going to act! George we'll go home and get ready to throw fifty-six bushels of peachblows on the market to-morrow, and bust that wicked ring all to thunder."—Wall Street News.

For Women.

CONDUCTED BY MISS RAY CLARK.

A MOTHER'S DIARY.

MORNING! Baby on the floor,
Making for the fender;
Sunlight seems to make it sneeze;
Baby "on a bender?"
All the spools upset and gone,
Chairs drawn into file,
Harnessed strings all strung across,
Ought to make one smile.
Apron clean, curls smooth, eyes blue
(How these charms will dwindle)
For I rather think—don't you—
Baby "is a swindle?"

Noon! A tangled, silken floss
Getting in blue eyes;
Apron that will not keep clean
If a baby tries!
One blue shoe untied, and one
Underneath the table;
Chairs gone mad, and blocks and toys
Well as they are able;
Baby in a high chair, too,
Yelling for his dinner,
Spoon in mouth; I think—don't you—
Baby "is a sinner?"

Night! Chairs all set back again,
Blocks and spoons in order;
One blue shoe beneath the mat
Tells of a marauder;
Apron folded on a chair,
Plaid dress torn and wrinkled;
Two pink feet kicked pretty bare
Little fat knees krinkled;
In his crib, and conquered, too,
By sleep, blessed evangel,
Now I surely think—don't you—
Baby "is an angel?"

CONCERNING FARMER'S DAUGHTERS.

MARY WAGER-FISHER.

ALTHOUGH the matter rarely, if ever, finds its way into print, it is nevertheless true that there is as much discontent among the daughters, as among the sons of farmers, but owing to the circumstances with which they are environed and their greater lack of venturesomeness, it is not often that a girl breaks away from the home life of the farm and turns to the city, or "goes West" to seek her fortune.

Every occupation not [illegible] evoid of personal incentive, is not worth much to the average American of either sex. We all lack the moderation and contentment of disposition that characterize the people of older countries. While we also have not reached certain methods of work that are an outcome of older civilization. For instance in Europe, the manufacture of butter is almost exclusively in the hands of women, and in France butter making is made such a speciality by women that consumers in making their purchases ask for certain brands—for the butter made by certain women who have achieved a reputation for the excellence of their butter. But in this country with its enormous production of butter and cheese, the manufacture and sale of both are carried on in the name of men, and in many large dairies the entire work is done by men. Although women have been quick to take advantage of many new opportunities for work during the past few years, yet in certain ways, particularly available to country women—ways which might be made pleasant, profitable and full of interest—they have been peculiarly slow in making efforts. For a farmer's daughter, to make butter, pack it in a tub, and send it to market to be dumped with numerous other tubs and sold in the lump, is a work that is commonplace enough; but if she applies herself to the making of a distinctive quality of butter, which in shape and brand has individuality like herself, and which must soon win a good repute among buyers, then the maker of it does her work to a new song. She has made a place for herself, and gets first class pay for her work. In the city of Philadelphia, and probably in other cities also, there are many families who pay from 75 cents to $1.00 per pound for their butter, whatever the market prices may be—being supplied with a certain brand of the article which they know to be always first-class, and this quality of butter rarely can be had in the markets.

No better time, could be had, than the present day of oleomargarine and butterine, for women to turn their attention to butter making in their own names and right—give their butter a stamp of their own design, and in their personal behalf make a place for it and fill it so well that there will be a continous and growing demand for it. The French women send their butter to their customers in small baskets, something like a strawberry basket. The butter, which is unsalted, and made fresh every day or two, is wrapped in a piece of muslin thoroughly soaked in strongly salted water and the butter remains in the wet salted cloth until used up.

In Finland, a far-away country to quote, there are traveling dairy-maids and dairy schools. The dairy-maids, or traveling teachers, were first appointed in 1866 officially, and as they were paid from the public treasury every inhabitant had a right to claim instruction from them. So much interest was awakened by the dairy-maids in butter and cheese making, that the government founded dairy schools, and schools were also founded by the owners of private dairies with women to teach the practical part of the work. There are but eight pupils allowed in each school, and after a course of two years they pass a final examination before the members of the Agricultural Society. During the two years the instruction consists of animal physiology, tending of animals in general, treatment of the common diseases of the cattle, the use of the thermometer, different methods of cooling milk and their effect upon the formation of cream, the treatment of cream, making of butter, the manufacture of cheese from skimmed and unskimmed milk and finally book-keeping by simple entry—in fact a thoroughly learned business, which in this country is taken up and carried on in a most unlearned and haphazard fashion.

Each dairy school receives from the State an annual subsidy of 2,400 Finnish marks. In addition to butter, cottage cheese can be made; where there is fruit in abundance, young farmerines ought to be able to make a local reputation for their jellies, preserves, spiced and canned fruits. Home prepared articles have a flavor and deliciousness that are never found in goods put up at factories, and there are always consumers of sufficiently refined and dainty tastes to buy these superior articles. So with certain cakes and pastries. Poultry raising is very profitable, and all occupations that bring one in contact with domestic animals and with nature have a healthful cheerfulness and wholesomeness about them that should make sweet and happy the life of any woman engaged in them.

If young country women want work to which they can put their brains as well as their hands, there is no place so advantageous for them as the country, especially, if they live in the region of a thriving town or on the line of railways, so that markets for their wares are available. To build up a business of any sort requires patience, pluck, perseverance and real capability. Before leaving the farm for the shop, or "store" or factory, I would earnestly advise all discontented and ambitious girls to first see what they can do with the means they have at hand.

If parents have money to "start the boys" in life, they should do so equally with the girls. Independence and self reliance are as necessary for women in this land of changing fortunes as for men, while work with a purpose in it is necessary to the best and truest happiness. And if farmer's daughters can establish a place for themselves by their work on the farm—work with aim and ambition in it—they can do no better, for life in the country is, beyond all question, of the best possible good to a human being. But a great many are exceedingly slow in finding it out.

WOMAN'S BEST WORK.

MANY different topics have been discussed in the Woman's Department of the RURAL NEW-YORKER—economy, etiquette, the fashions, etc.—but among all the good, energetic and intelligent women who write those articles, not one, I think, has brought forward the subject which of all oth-

ers should and does engross the mind of every thinking woman of to-day. While all those minor matters are entitled to a moderate share of attention, and are good as far as they go, still they should be considered *as* minor matters, and, as such, occasionally give place to something of infinitely more importance, namely, the battles to be fought and which are being fought by America's noblest daughters, for God, and home, and native land, against their greatest enemy—the rum traffic. Cannot the good women who discourse so wisely of securing the physical welfare of our children, say something of this matter? What though we so faithfully and tenderly care for the dear boys that they grow up into stalwart youths, straight as young pines and princely as modern Absaloms? None the less are the terrible snares set for them. Oh, mothers! none the less reason have we to fear and tremble as we think of the dread possibilities of their future.

So let us to the rescue, each in her own way doing what she can. This is peculiarly woman's work, and we cannot conscientiously ignore or set it aside; and so I think that in this department of the RURAL the subject of temperance might with great profit receive some attention. Has any one of you good news to tell as to what is being done in your community? Has any one sad news, of failure and discouragement? If so, sympathy is sweet, and perhaps we may help each other more than we know. E. A.

HELP, OR NO HELP.

A GREAT deal is said for and against hired help for women, though I do not recollect ever seeing much said on the matter of hired help for men. I suppose it is taken for granted that they must have it, when they have extra work to do. Extra work for woman only takes the place of fancy work and croquet and such little diversions which come in as a by play. She ought cheerfully to set these aside for a few months in the Summer considering what a long resting spell she has all the year. At least that is the way you would think some folks reasoned, about woman's work.

Those who suffer most from this peculiar man's view of the question are without doubt, young mothers with one baby in the arms, and an ambitious, money making husband. Men get more sense as they grow older, and two or three bad break-downs, are warnings not to be slighted.

I suppose the man does not live who has any conception of the care and labor which one baby in its cradle makes for a mother. Nor is the care very much lessened when it begins to crawl about the floor and pull over the water pail, and dig into the ashes and chip basket, though it is apt to be "so cunning" then, it pays its way pretty well.

If anybody needs a hired girl it is a mother with one baby. When there are four children the older ones can watch the younger, and when there are six it is quite possible for a healthy mother to dispense with the infliction of "help," and enjoy the luxury of having her house all to herself, and her work done in her own way. But it is at a fearful risk that the young mother attempts it. By "putting up" with help in the early years she may save herself for a happy, cheerful, mature age instead of making middle life a dreary bundle of infirmities. J. E. M'C.

HINTS.

LEMON.—The juice of a lemon, squeezed into a glass of water, without sweetening, drank before breakfast at this season of the year, is said to be a preventive of malaria, and an excellent thing for almost everyone to take, particularly if they are bilously inclined.

HAIR WASH.—Add to a wine glass of cold water a half tea-spoonful of sal-volatile, and with a small piece of flannel or sponge well wash the head and hair, dividing it into partings, so that every part is washed. This hair wash cleanses quickly, and that it preserves the color of the hair has been proved by an experience of ten years. Spirits of hartshorn may be used instead of sal-volatile, six drops to the wine-glass, and applied in the same manner.

NECESSITY OF GOOD VENTILITION IN ROOMS LIGHTED WITH GAS.—In dwelling-houses lighted by gas, the frequent renewal of the air is of great importance. A single gasburner will consume more oxygen, and produce more carbonic acid to deteriorate the atmosphere of a room, than six or eight candles. If, therefore, when several burners, are used, no provision is made for the escape of the corrupted air and for the introduction of pure air from without, the health will necessarily suffer.

DRYING FLOWERS IN SAND.—To dry flowers properly in sand, dishes sufficiently deep to permit the flowers to be covered at least an inch with sand should be procured. White scouring-sand will suit; lay it half an inch deep in the dish. Place your flowers, stem downwards, in this sandy layer and sprinkle sand over them till all the petals are filled and the blossom quite covered. It is as well to hold them firmly while sprinkling them, so as to insure a complete dusting. This operation over, place the dish in a warm and dry situation. In about a week you may examine the flowers, but some flowers will require a much longer time than others. Should there be any trace of moisture in the dish at the first inspection, dry the sand before using it again, or use new sand. This is a very much better way to dry flowers than pressing them out. They are by this method kept in shape, their colors are preserved, and may be retained even for years. Bright flowers, such as geraniums, carnations, pinks, pansies, gladioli, etc., are particularly adapted to this method. White flowers will not answer, nor will the plan succeed with succulent plants—as hyacinths; but ferns will answer very well under this treatment. Very pretty arrangements can be made of these dried flowers when mounted on card-board or placed in baskets, according to the taste of the individual.

ABOUT WOMEN.

ADELINA PATTI is suffering from acute bronchitis.

"He will not die," are words said to have been uttered by Mrs. Garfield in relation to her husband. May she realize their truthfulness.

AT the wedding breakfast of Whitelaw Reid and Miss Mills, the groom found at his plate a slip of paper which proved to be a certified check for $500,000 from the father of the bride.

MRS. LUCRETIA PLUME, widow of General Joseph Plume, of Newark, N. J., died on Sunday, aged 87 years. She was probably the oldest native resident of the city at the time of her death.

MRS. MARTHA A. MAXWELL died at the house of her sister, Mrs. Nathan Thompson, at Rockaway Beach. Mrs. Maxwell obtained a national reputation by her wonderful exhibit at the Kansas-Colorado department at the centennial. She was a most devoted lover of nature.

MRS. JOHN JACOB ASTOR has just sent another party of 100 children to homes in the West, through the agency of the Children's Aid Society. The whole number of homeless little ones thus provided for by Mrs. Astor, is 813, at an expense of more than $11,500.

Miss Dog Bull is said to be the belle of the Indians at the Standing Rock Agency, and several duels have been fought by the young braves who are rivals for her hand. As her father owns 300 ponies, she is considered a good catch, aside from her superior personal attractions.

MRS GLADSTONE is a benevolent woman, and does many kind things for the villagers of Hawarden. She has given them an excellent coffee-house which is open week days and Sundays. She has also established near the castle a home for orphans Many of the Gladstone servants have been on the estate twenty, thirty and forty years.

MISS CORSON gave the first of the series of lessons on cookery before the Training School for Nurses, in the parlors of the Maternity, on Concord street, Brooklyn, Monday, May 30, and despite the fact that it was Decoration day, there was a good attendance. Miss Corson had a gas stove, with which she practically illustrated her lessons and entertained her hearers hospitably. The course of lessons were continued a week, each afternoon, from three to five o'clock.

KEEPING ON GOOD TERMS WITH A WIFE.—When the celebrated Theodore Parker married Miss Cabot, he entered in his journal on his wedding day the subjoined resolutions, the keeping of which made his life a happy one:

1. Never, except for the best of reasons, to oppose my wife's will.
2. To discharge all duties for her sake freely.
3. Never to scold.
4. Never to look cross at her.
5. Never to weary her with commands.
6. To promote her piety.
7. To bear her burdens.
8. To overlook her foibles.
9. To save, cherish and forever defend her.
10. To remember her always, most affectionately, in my prayers.

Thus, God willing, we shall be blessed.

CORRESPONDENT'S CORNER.

WILL the lady that suggested those holders be so kind as to give the ladies of the RURAL a pattern of a butterfly, or some other pretty pattern for a holder to be used about a parlor stove?

MRS. T. J B.

Will you please ask Miss Harvey to give me a description, and possibly illustration of Kensington stitches? I would esteem it a great favor.

[Will Miss Harvey oblige?] MRS. W. V. A.

Mollie E. who asked, sometime since, for a sample of coverlet from Mrs. W. V. A., will oblige by sending her address to this office. R. C.

Far, far better for you than beer, ale or porter, and free from the intoxicating effects, is Hop Bitters.—*Adv.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

HOUSEHOLD NOTES.

MARY WAGER-FISHER.

TO DRIVE FLIES from a room, make "switches" for the purpose: to the end of a stick—a lath will do—nail a newspaper which has been folded the long way, and which has been cut into narrow strips to within an inch of the folded edge, so that it is like a length of wide fringe. Wind the "heading" around or across the end of the lath, and secure with two tacks. Make two or three, and renew the fringe of paper so fast as it wears it out. If the way in which the flies have poured into our house thus early is in any wise prophetic of the season, there will need to be an unrelenting battle with them for a long time to come, and "switches" made and worn out by the wholesale.

Anent fruit canning, a housekeeper tells me that she always runs a knitting-needle down into the hot fruit, as it lets out the air and admits of more juice being put into the can.

A nice way to cook a year-old chicken is, first to steam it until tender and then fry it on a griddle, that is, if one likes fried chicken; or broil it, if one likes it broiled. The griddle should be hot enough to brown the meat. Oil it with a little butter. Make gravy of the water that has steamed the fowl, which should be sufficiently reduced for the purpose.

When corned beef, ham, or any meat, is boiled, that is apt to be somewhat dry and juiceless, it is best to leave it in the juice in which it has been cooked until cold, as it will then reabsorb part of the juiciness drawn out in boiling. Roasted or baked meats are much nicer when the meat is placed on a rack which keeps it up out of the gravy in the roasting pan.

Don't throw into the rag bag soiled mosquito netting. It makes the best of cloths for cleaning wood-work; the coarse places in the threads act like a brush. Old underwear—such as knitted shirts and drawers—makes excellent wash cloths for smooth surfaces that require careful treatment.

Cast-aside tooth brushes are good for cleaning carved wood-work, especially ornamented bedsteads and other furniture that has a high polish.

REFINING INFLUENCES OF A WELL-ORDERED TABLE.

CHIEF COOK.

"ORDER is nature's first law," and neatness is her chief-cook, I was going to say, and I see no reason for not saying it. Well cooked food is as essential to health as pure air or water, but how disgusting it is to see it served in a slovenly manner. As well dress a pretty, graceful girl in fine stuff, spoiled by bad fitting and making. The neatness of a table is not necessarily dependent upon cloths, crockery and cutlery, for a bare pine table may show the skill and taste of the housekeeper, in the placing of the food and its accessaries, as perfectly as the most expensive and elaborate of furnishings.

The dishes should be evenly distributed around the edge; the meats should be in their appropriate plates, arranged with a view to convenience of carving and serving; the vegetables, by their bulk, shape and color should be utilized for effect of appearance, and the "*tout ensemble*" plainly saying to the guests, "Please make yourselves at home." Such a spread is evidence of skill and taste in the queen of the household.

No one can take a seat before such a table, without its banishing all unpleasant thoughts; the weary enjoy their food; sociability reigns, and pleasant, lively converse ensures healthy action from the food.

Certain arrangements should be stereotyped from day to day, that awkward habits may not be fostered among the juniors, such as the placing of the plates, knives and forks, napkins, glasses, salts, etc, etc. For the rest, a pleasing variety, depending upon the character of the viands, changing daily, prevents monotony and is exercise for the artistic faculties

Gentle surprises are pleasant here, and may be produced in a thousand ways, to suit the means of the family. Tiny bouquets, neat as neatness itself—I should have said herself, for neatness is feminine—green sprays and dainty folded napkins add much to the beauties of white cloth, clear glass, bright cutlery and orderly arrangements.

No one will deny that a well-spread table conduces to, I may say compels, cheerfulness, sociability, appetite, relish and health, and is notably elevating in its influence. It is merely beauty hovering o'er the ear of utility.

Each effort to improve the family table, making it a center of attraction, will, like a stone cast upon a placid lake, spread in an ever widening circle till the whole house, the household, the office, store, even the farm itself will show by their growing neat and orderly appearance that the "angel of the household" is a ruling power.

To those who are already "*au fait*" (*Anglice*, "up to") the niceties of the table, I need only say "persevere," but of the great majority of housekeepers I ask only a trial of a few months, satisfied that they will find that civilizing influences are always progressive.

DOMESTIC RECIPES.

Rural Berry Shortcake.

CRUSH the fruit and sweeten liberally with white sugar. Do this an hour or more before it is needed. For the cake take one quart of sifted flour, two teaspoonfuls of butter and milk to make only stiff enough to roll out. Divide and roll into oblong flat cakes and bake in a hot oven. When done split each cake and pile one layer on top of the other, with the crushed fruit between each and over the top. When served, pour a generous quantity of sweetened *cream* over each piece. This cake has been made with both strawberries and raspberries, and the many visitors at the RURAL FARM have pronounced it "the best of its kind."

Rice Pudding.

Beat together one and one-half pints of milk and three eggs. Stir in a pound of rice a pinch of salt, six tablespoonfuls of sugar, one-fourth of a nutmeg, grated. Put all into pan, boil until the rice is done, then add one-half pound of chopped raisins and bake the top brown. If the raisins are put in first the milk will curdle.

Mumbled Eggs.

Break eggs into a sauce pan, add an ounce of butter to each, and a little salt. Stir over the fire till of the consistency of a soft boiled egg and serve hot on thin slices of toasted bread.

CHIEF COOK.

Boston Tea

We received from the London Tea Company, 801 Washington Street, Boston, samples of their March Oolong and Japan teas, with request that we should try them and report thereon. The Company has adopted the plan of offering premiums to induce persons to get up clubs, or for families to order a large quantity at one time. We need only say that the samples of tea sent us were excellent. The Company will forward price list and circular to all applicants free, and samples of tea will be sent upon receipt of 10 cents.

Bad dreams, disturbed sleep, indigestion, stomach gas, all vanishes before Hop Bitters.—*Adv.*

REAL ESTATE of every kind, town and country, in the Valley of Virginia. Correspondence solicited. Send per postal card for pamphlet catalogue. TIMBERLAKE, STICKNEY & GUYER, Real Estate Agents, Middletown, Frederick Co., Virginia.

News of the Week.

HOME NEWS.

MONDAY, July 18, 1881.

The President is now out of danger, as is thought by his attendants, and his full recovery is now but a question of time, as far as his wound is concerned.

On Saturday last Warner Miller was elected to succeed Platt in the United States Senate, receiving 76 votes out of 148 cast. The convention then adjourned until to-day, when another attempt will be made to elect a successor to Mr. Conkling.

A terrible cyclone passed over the village of New Ulm, Minn., on the 16th inst. Over a hundred buildings were destroyed and many persons killed or wounded. Hundreds have been left homeless.

Griscom, the Chicago faster, completed his 45 days without food on Tuesday last. He has lost 49¾ pounds since beginning his fast, his weight at at the close being 147½. He drank during the time an average of about 32 ounces of water a day.

A new war on passenger rates to the West has begun. From Boston to Chicago the cut rates are $16, and from this city to Chicago the fare is $14. This open rivalry between different lines is said to have been started by the sale of tickets at reduced rates to the students of New England colleges whose homes are in the West.

Gov. Cornell has vetoed the bill appropriating $500,000 for continuing the work on the Capitol at Albany. His objections are based on the grounds that the money is not needed for immediate expenditure, and that the builders may wait until the previous appropriations are exhausted before asking for more.

Extremely hot weather has prevailed during the past week, especially in the West. At Cincinnati the thermometer marked 103°, and over 1,100 cases of sunstroke were reported; at Indianapolis the thermometer stood 101° in the shade; at St. Louis, 104°; at Bloomington, Ill., 100°; Alton, Ill., 100°; Sullivan, Ill., 100°; Kankakee, Ill., 100°; Springfield, Ill., 100°; Lincoln, Ill., 104°; Charleston, Ill.; 103°; Decatur, Ill., 103°; Newark, O, nine sunstrokes, four fatal; Jacksonville, Ill., thermometor 108°.

Heavy rain storms are also reported. At Dubuque, Iowa, streets were washed out, trees blown down and other damage done; at Winona, Minn., a damage of $3,000 was done by a hail storm; at Des Moines, Iowa, 60 families were made homeless; at Oskaloosa, Iowa, heavy losses in stock, buildings and crops were suffered and at Marengo the Iowa River, by its overflow, has caused a damage to the amount of $200,000.

As a specimen of the extent to which "gambling in life" is carried on by the mutual insurance concerns in Northern Maryland and Southern Pennsylvania, to which reference was editorially made some weeks ago in the RURAL, a telegram on May 12th from Westminster, Md., says that an old negro named Robert Bell died there on the night of the 10th, on whose life insurance policies had been taken out in various "companies" aggregating over a million dollars, in sums of from $2,000 to $12,000 by different parties who had no interest in the rheumatic fellow beyond the desire for his speedy death. He supported himself by selling apples on the street.

A rather notable student finished his course at the Yale Law School, graduating third in his class. This was Peter Doyle, ex-Secretary of State of Wisconsin. Mr. Doyle is now 45 years old, and has been a successful lawyer and politician in Wisconsin. Being conscious of some defects in his legal education he determined to remedy them at an age when most men would not feel like "going to school." He worked hard while at the Law School and was popular with students and professors.

Fourteen cars of a freight train on the Chicago, St. Paul, Minneapolis and Omaha Railroad broke loose on Sunday and started backward down a steep grade toward North Hudson, Wis. At the depot they crashed into another freight train, killing its engineer, George Trider. The engine and several cars were badly damaged, the loss being estimated at $40,000.

Governor Foster has received telegrams from the Governors of Indiana, Massachusetts, Wisconsin, Tennessee, Arkansas, Illinois, Virginia, Alabama, Missouri, Georgia, Kentucky, Mississippi, New York, Nebraska, Vermont, Florida, New Jersey, West Virginia and Wyoming Territory approving the suggestion in reference to fixing a day to be observed as a day of prayer for the recovery of President Garfield.

The Hon. Phineas W. Hitchcock, ex-United States Senator from Nebraska, died in Omaha on the 12th, of general debility, augmented by exposure in the recent extreme heat. He was 50 years old and a classmate of General Garfield.

Six lines of railroad now enter Denver, and three more are soon to be added.

A statement prepared in the contract office of the Post Office Department shows that the Star Route service has been cut down $1,200,000 up to date. The Second Assistant Postmaster General says that the reductions in the Star Route service cause little complaint, and will be remedied where the complaint is just. Ten per cent. will have to be restored.

The Women's Silk Culture Association of Philadelphia is planning for an exhibition of the silk productions of the United States during the coming Autumn. The art schools will be invited to send exhibits of painting and embroidery on American silk, and manufacturers everywhere of American silk are assured that an opportunity will be given to them to display exhibits under the most advantageous circumstances. It is expected that the fair will be held in the latter part of October, and continue two weeks.

A little boy in West Virginia sent his pet fox to Baltimore to be sold for the benefit of the Garfield fund. He wrote: "Be careful that he don't gnaw his way out of the box. Sell him for Mrs. Garfield Tell her I sent it, and that I hope she will like my idea. Tell her I hope Mr. Garfield will get well. N. B.—I paid $1 for the chain and box. Please send me one-fifth of what it sells for, as I want to buy a pig."

Gen. John C. Pemberton, who commanded the rebel forces at Vicksburg during the memorable siege which ended in the surrender to Gen Grant July 4, 1863, died at Penllyn, Pa., on the 11th inst., at the age of 64 years. Gen. Pemberton was a native of Pennsylvania, having been born in Philadelphia in 1817. He was appointed a cadet in the West Point Military Academy in 1833, and was graduated in 1837, ranking 27 in his class.

A Dakota ranchman became convinced that life was not worth living, but desired to hear all that could be said on the other side before committing suicide. His only companion at the ranch was a boy, whom he gave one hour in which to dissuade him from his purpose. The youth used all the influence he could think of, and read some appropriate passages of Scripture, but failed to change the man's mind. At the end of the hour the misanthrope shot himself.

The Michigan State Supreme Court, Tuesday, rendered a decision in a grain gambling case. A party having lent another money with an agreement to share the profits in an attempt to "corner" wheat, the lender sued to recover the money. The Court held that a combination to artificially affect the price of any necessity of life was illegal, and that the money advanced to purchase such contract cannot be recovered.

The Troy Times says a game of base ball was played at La Salle, Ill., on Sunday last, at which the Rev. Moses Gunn, of that city, opened the exercises with prayer, and delivered an exhortation to the contesting nines. At the conclusion of the game the reverend gentleman indulged in another refrain, tendering his services as chaplain and umpire on the following Sunday, which were accepted.

"Like a Fearful Dream."

"I have been so much better this Summer," writes a lady who had used the Compound Oxygen. "Every time I think of it I feel as if words would not express my pleasure or my thanks to you for what you have done for me. I shall never forget it. *It seems like a fearful dream, when I think of two years ago. I dreaded to have night come, for I knew there was no rest for me*, but that I must bear the pain and sickness as well as I could until another morning, which I dreaded to see, for I was so weak it seemed as if I could not see even my own family. Sometimes I wished I could stop breathing just to get a little rest. *Now it is so different. I sleep good the most of the time, and am well compared with what I was then.*" Our Treatise on Compound Oxygen, containing large reports of cases and full information, *sent free*. DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

The exports of live stock from Ireland to Great Britain were unusually large in June, amounting to about 100,000 head, mostly horned cattle, with a considerable number of sheep, swine and horses. The cattle were "stores" and fat beasts in about equal proportion. The animals were shipped from 18 ports, but mostly from Dublin, Belfast, Cork, Waterford and Derry.....The British Dairy Farmers' Association will hold its yearly fair at London Sept. 16—20. Liberal prizes will be offered for butter and cheese and American dairymen are invited to exhibit their products.....A severe plague that lately broke out in Siberia, has traveled westward as far as St. Petersburgh, Russia, where it is very destructive to horses and fatal also to human beings. It is spread chiefly by the sale of the hides of diseased animals by the ignorantly reckless peasantry.....The appointment of Hon. L. S. S. West as British Minister at Washington to succeed Sir Edward Thornton is gazetted at London.....Alfred H. Moore of Philadelphia owns $75,000 worth of dogs.....Negotiations were closed at Peoria, Ill., Wednesday last for the purchase of 60,000 acres of land on the line of the Little Rock and Fort Smith railway by the Catholic colonization society.....The army worm invaded Long Branch Wednesday, millions coming from the north. Hollywood, Mr. Hoey's place, is devastated.....Prof. C. V. Riley is appointed entomologist of the Department of Agricultural, *vice* J. H. Comstock, resigned, to take office August 1.....Reports of the cotton crop from Georgia, Florida and Virginia are to the effect that it is later than last year and in average condition. In Louisiana, South Carolina, Mississippi and Arkansas the crop is from 10 days to two weeks late. Considerable drought is reported—The first bale of cotton of the season of 1881, raised by Mrs. H. Hausman of Dewitt, county, Tex., was received at Galveston Saturday the 9th and sold at the exchange for $425.....Since 1871 the Virginia peanut crop has grown from 225,000 bushels to 1,600,000 bushels.... ...A granger war against the barbed wire manufacturers is threatened in Iowa. The farmers of the State some months ago held a convention, presided over by the governor, to protest against what they called the "barbed wire monopoly." A committee was appointed to wait upon the owner of the patent and see if some compromise could not be made. This has failed, however, and a company, called the farmers' anti-barb-wire-fence association, has been formed with a capital of $100,000 to fight the question in and out of court. Over 200,000 persons in the State are said to be interested in the movement.

There are now 200 persons connected with the Land League imprisoned in Ireland under the Coercion Act, including one member of Parliament, one priest, one magistrate, several town councilors and many poor-law guardians.....The sale of Queen Victoria's yearlings has of late years generally brought forward a very inferior lot of animals. This year, however, the contrary was the case; the yearlings, although the majority of them were small, realized an average of nearly $1,000 apiece.....There is reason to believe that in a few years carp will be abundant in this country. The fish that were put in ponds in Morris County, New Jersey, last December, all lived through the Winter and are thriving finely. They have increased from two inches in length to six inches. They find their own food and bid fair to multiply rapidly.....Australia suffers from both animal and vegetable plagues. It has groaned under a rabbit pest and a kind of watercress, which somebody thought would be "such a good thing," but which has served admirably to choke up streams; and now it is in mortal dread of the lantana, a shrub resembling a gigantic raspberry bush, which was imported as a garden ornament from France. Birds like the seed, and scatter it in all directions, and the shrub threatens to grow densely and become an insufferable nuisance..... According to the best information, there are about 4,600,000 sheep in Texas. This will probably be increased 20 per cent. during the coming lambing season, bringing the number up to 5,500,000. Valuing them at $2.50 each would make the total valuation of sheep in Texas $13,800,000.....At a late meeting of the California State Viticultural Commission it was determined to issue treatises on the various vine pests, remedies, translations on vine culture, etc., to be prepared under the direction of the chief executive officer and the committees on phylloxera, vine pests and diseases of the vine, these to be published from time to time in pamphlet form, and finally incorporated in a bound report at the end of the year. These pamphlets will be circulated free to those of the public desiring them.....The Monthly Bulletin of the American Jersey Cattle Club has been discontinued with the June issue. Mr. Geo. E. Waring, Jr. Secretary or the Club and Editor-in-Chief of the Bulletin, says its publication absorbed too much of the funds of the Club.....With regard to the Canadian crop prospects, the Toronto Globe published, on July 13, crop reports from all parts of the Dominion, which it summed up as follows:—"The general result obtained from the reports is that the harvest, as a whole, will be by no means equal to the splendid harvests of 1877, 1878, 1879 and 1880, but will be superior to that of 1876. Wheat is the only cereal in which a deficiency in the crop is threatened. Fall wheat is 12 per cent. below the average crop; Spring wheat is in a much better condition than Fall wheat, but 3 per cent. less than an average crop. Rye is an unimportant crop, except in certain localities. Barley, oats and peas all promise a bountiful yield, and the acreage, as well as the quality, is far above the average. The good promise in these crops will go far toward attoning for the anticipated shortage in wheat. The hay crop is somewhat below the average, but not greatly so. The figures relating to the corn crop show the effects of the unseasonably cold weather which marked the month of June; not more than 84 per cent. of an average crop is expected. The reports concerning potatoes and roots show a very favorable condition of these crops. The apple crop is a long way below the average. The maritime Provinces appear to have good promise for their staple crops—hay, oats and potatoes."..... A cablegram on the 13th announces that "the Italian Senate has passed a bill to prevent the spread of phylloxera"—a bull against the comet!—"and to attempt the acclimatization of the American vine."..... The French Vegetarian Society agitators say that vegetarians are never hungry or thirsty. Yes, that's the newest kind of "News." Agricultural? Why, yes, of course, vegetarian—vegetables—don't you see"..... Large quantities of coarse Spanish wine, after being handled at Bordeaux, are sent to England for good French wine.....Some of the New Jersey farmers will appeal to the Legislature for protection against English sparrows. They think that a bounty ought to be offered for every dead sparrow.....Enormous damage and loss were inflicted on crops and stock by severe storms in many parts of Minnesota and Iowa, last Monday, the 11th.....Early in the month the Army-worm was destroying Alfalfa fields in Chico, Cal, ...Los Angeles County, Cal., has shipped 282,186 pounds of honey, against about 1,250,000 from San Diego County.....Mushrooms are extensively cultivated in the Mammoth Cave, Ky..... .....After a discussion on the value of the University of California to the farmer and viticulturist, the following resolution was adopted:

Resolved, That it is the sense of this Board that the Agricultural Department of the State University has been ably conducted, and has already been of incalculable benefit to the farmers of the Pacific Coast, and indirectly to all its industries, that its weakness lies only in want of adequate appropriations of money to maintain and conduct its work, and that the agriculturists of the State be urged to accord to the University a cordial and zealous friendship and support.

The Secretary was instructed to transmit a copy of this resolution to the Board of Regents..... Country papers in Pennsylvania are asserting that whortleberries, in many places in that State, are infested with poisonous bugs.....The well known trotting mare, American Girl, was badly gored by a bull on Tuesday, the 12th inst, at Ottawa, Canada.....The trotter, Maud S., beat the best time by a quarter of a second at Pittsburg, on Wednesday last, making the mile in 2:10½.....Bush fires are doing an immense amount of damage in all directions about Quebec. Canada, according to a telegram of the 14th.....Volunteer Junior, a valuable horse, and one of the most promising stock getters in Ontario, died in Welland, Canada, on Wednesday, from lockjaw, which resulted from a kick..... Scarcely an average yield of crops is expected in Germany, according to the latest official estimate. .....Thirteen hundred sheep, with their shepherds, were recently overwhelmed by an avalanche near Brigel, in the Grisons, Switzerland..... .....The Agricultural Gazette (Eng.) of June 27, summarizing its crop reports from various parts of the Kingdom, says that as to the wheat crop opinions are very various. Upon the whole it thinks the impression made by these reports is favorable. The crop is late and in some places it is thin, but generally there is a prospect of a fair average yield. Of Spring grain the barley is generally looking better than the oats, which have suffered from the wire-worm, and are in many places patchy.....It is estimated that there are upwards of 600 commercial florists establishments within a radius of ten miles from City Hall, New York, and that probably $10,000,000 are invested in their lands, structures and stock.....The students at the Iowa College Farm, last year, made all the sugar they used from Orange Cane.

WASHINGTON, July 15.—The returns to the Department of Agriculture on July 1 show an increase in the condition of cotton since the reports of June. The average condition is 95, against 100 at the same time last year. The following are the reports by States: Thirty-four counties in North Carolina average 94; 19 counties in South Carolina average 93; 57 counties in Georgia average 98; 13 counties in Florida average 90; 32 counties in Alabama average 102; 39 counties in Mississippi average 94; 18 counties in Louisiana average 96; 61 counties in Texas average 89; 32 counties in Arkansas average 92; 18 counties in Tennessee average 105. The plant is generally reported small and 10 days late. Hot and too dry weather is almost universally noted, but, except in Southern and Western Texas, little injury was reported from that cause at the date of the returns. Alabama and Georgia each report a better condition than last year, while Texas and Arkansas are lower. Insect injuries are seldom mentioned. The condition of the wheat crop, as reported July 1, is much better than it was on June, 1, and averages 83 for the whole country. The Atlantic States fell off slightly as compared with the returns for the same time last year, but the large wheat region north of the Ohio River and west of the Mississippi returns a low condition compared with 1880. Michigan reports only 64 per cent, and Illinois 60. Ohio and Indiana are below last year, but report a fair prospect. Missouri and Kansas make great complaint of damage from insects. In the Spring wheat States Iowa alone returns a condition much lower than last year, namely 72. The increase of area planted in corn is nearly 2 per cent over that planted in 1880. The average condition of the crop is not so high as the last two years, and is 90, against 100 last year. In all the North Atlantic States the crop is backward owing to the cold, wet Spring, but in the States south of the Delaware River and on the Gulf of Mexico it is reported as fair. Texas, however, reports serious injury from drought. In the great corn-producing region bordering on the Ohio and Mississippi Rivers the average is below last year's, particularly in the State of Iowa, which only reports a condition of 77, caused by the cold Spring and too much rain. In Illinois and Missouri the condition is reported "very favorable."

San Francisco, July 15—A dispatch from Portland says that the crops throughout the valley and in Southern Oregon are greatly in need of sunshine, and that the bright weather which now seems to be promised is welcome. The whole crop east of the Cascade Mountains will be nearly 100,000 tons, of which about 75,000 tons will be exported. The supplies this year will exceed those of last year from 30 to 40 per cent.

A telegram from San Francisco this morning says the Produce Exchange of that city reports there still remains in the State, of the crop of '80: 12,248,278 centals of wheat and 134,592 barrels of flour. (A cental is 100 pounds) This is considered a low estimate; but it is the largest surplus of wheat ever carried over.

Special Despatch from Detroit.

The demand of the people for an easier method of preparing Kidney-Wort has induced the proprietors, the well known wholesale Druggists, Wells, Richardson & Co, of Burlington, Vt., to prepare it for sale in liquid form as well as in dry form.—*Inter-Ocean.*

Lydia E. Pinkham's Vegetable Compound is a remarkable remedy for all those painful complaints and weaknesses so common to our best female population. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, billiousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

Feeble Ladies, aged persons, weakly children, persons of sedentary habits, all need Hop Bitters daily.

Premature Loss of the Hair

May be entirely prevented by the use of BURNETT'S COCOAINE.

THE superiority of **Burnett's Flavoring Extracts** consist in their perfect purity and strength.

CROPS AND MARKETS.

MONDAY, July 18, 1881.

THERE is a great deal of difference in the various crop reports throughout this country, even from the same sections, and the same may be said, to a less extent, of European advices both by mail and cable. Our Agricultural News Department furnishes all the official crop reports of this country, issued during the week just over. From those of the Agricultural Department, which alone take in the entire country, it will be seen that the outlook for all the principal crops has considerably

improved of late, so that the wheat crop is now put at only 17 per cent. less than last year's, and the corn crop at only 10 per cent. less. Advices from several of the great wheat and corn-growing States, however, do not altogether confirm this favorable view. The official estimates from the Boards of Agriculture of the following States report the following shortages in wheat as compared with last year's crops: Ohio, 12,000,000 bushels; Illinois, 37,000,000 bushels; Michigan, 14,500,000 bushels; and Iowa, 17,000,000 bushels, or a total shortage in these four States of 80,500,000 bushels. It is by no means likely, however, that this ratio of decrease will be maintained in the other States. In fact, as we have already stated, the total yield must be larger this year than last in some Sates. Views with regard to the wheat crop of this State vary greatly, some insisting that there will be fully an average yield, and others maintaining that there will be a decrease of as much as 20 per cent. Our neighbors of the Dominion, too, are likely to have a short wheat crop, Fall wheat being put at 12 per cent., and Spring wheat at eight per cent. below the average; but barley, oats and peas will be fine crops, much above the average in yield and acreage; while in corn the shortage is likely to be as much as 16 per cent., though next month and the rest of this may do much for corn so far North as Canada. The Winter wheat harvest is now over in Tennessee, Kentucky, Virginia, Maryland, Delaware, West Virginia, Ohio, Indiana, Illinois, Missouri, Kansas, and is progressing in New Jersey, Pennsylvania, New York, and the Southern parts of the other States which grow Winter wheat, and it is probable this week will complete the Winter wheat harvest. Last Thursday, July 14, there were numerous reports in the Produce Exchange here that the wheat threshing was in may places disappointing; but these reports came chiefly from Chicago. The generality of reports throughout the country, however, say that threshing shows the new grain to be unusually good, though the yield is not always so satisfactory. The excessively warm weather of the two last weeks is said to be injuring the Spring wheat considerably, and a great number of severe storms in quite a large number of places in the Spring wheat region, have also done vast local damage to that and all other cereals. On the whole, we do not yet see any reason to modify our previously expressed opinions of the crops.

With regard to crops across the Atlantic, the last Mark Lane Express—that of the 11th—says: "The sudden and violent reduction of the temperature about the middle of the week has unfavorably influenced all maturing crops. A white frost was reported on Friday night. The copious rainfall has, however, greatly favored the Spring sown crops." A cablegram of the 12th says: "The Austrian harvest promises to be fully up to the average." Another cablegram of the same date says that the French agricultural journal, the *Bulletin des Halles*, of Paris, reports: "The wheat crop will be fair in the southeast of France, poor in the south, good in the west and center, fair in the east, good in the northwest and north and poor in the northeast. On the whole, it cannot exceed an average crop, and it may be slightly under it. The best crop cannot exceed the average." This is a trifle less rosy-hued than previous French reports; but the *Bulletin des Halles*—the best market reporter in France—is generally trustworthy, though conservative, in its crop reports. A cablegram from Berlin on the 14th, says: "There is every prospect that the harvest will be much worse than it was last year. There appears to be a prospect for a general harvest in all crops valued at only from one-half to two-thirds of an average yield." This applies probably to Prussia, chiefly, but with its accessions of territory in 1866 and 1870 Prussia now embraces most of Germany, and last year's crops there were by no means good ones—not enough for home use, the German exports of all breadstuffs to Great Britain in '80-'81 having been only 512,976 cwts. against 2,210,361 cwts. in '79-'80 and 3,337,627 cwts. in '78-'79, while Germany imported from France 143,000 cwts. of flour and 127,002 cwts. of wheat, besides a much larger quantity from this country. Unless the above report, therefore, is either greatly modified in its evil gist, or restricted to a small section, Germany, despite Bismarck's late heavy duties on imports of foreign cereals, must use a great deal of foreign breadstuffs in '81-'82. This, however, is far away the worst report we have had from Europe. The new wheat will hardly come into market in Great Britain before September 1, but in Southern France the harvest is already in full blast, while it is completed in Spain whence mail reports are somewhat unfavorable; in Algiers, where the crops were good, but the belligerent troubles disturbed harvesting; and in Egypt, where the harvest was fair.

During the past week breadstuffs here have shown an upward tendency, though across the Atlantic prices were either stationary or a shade lower. Winter wheat and Indian corn were particularly stiff and were extensively dealt in—wheat mostly on speculative account, and corn chiefly for shipment, although for speculative purposes also to quite a respectable aggregate. Trade in Spring wheat was limited, but prices were firm. New Winter wheat came into the Baltimore market two weeks ago and a few odd lots of it brought fair prices in this market last week.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail and lakes, on canals and on the Mississippi River was as follows:

	1881. July 9. bush.	1881. July 2. bush.	1880. July 10. bush.	1879. July 12. bush.
Wheat	15,619,976	15,970,746	10,979,880	11,701,587
Corn	15,528,581	14,511,347	17,240,688	11,757,399
Oats	7,465,147	8,333,491	2,779,775	1,489,490
Barley	171,611	193,974	156,213	380,475
Rye	128,684	136,071	129,583	329,979
Total	38,913,979	39,149,631	31,286,138	25,658,940

It is thus seen from the difference between the visible supply in the different years, that farmers must have kept back a good deal more than usual of their wheat and oats from last harvest; and a considerable quantity is said to be still on their hands. This is especially the case in California and Oregon where lack of transportation facilities forced farmers to hold their wheat last season or sell it at a heavy loss. The amount still on hand from last harvest on the Pacific Slope is put at over 24,000,000 bushels. Henceforth, counting in flour as wheat, all the unsold old crop will, of course, come into competition with the new crop and affect prices. Last week, however, there was a pretty heavy falling off in the receipts of breadstuffs at this port, as will be seen by the following table made up to Friday evening, July 15.

RECEIPTS OF BREADSTUFFS AT NEW YORK.

	W'k end'g 8th.	W'k end'g 15th.
Flour, barrels	107,350	111,000
Wheat, bushels	1,303,600	939,500
Corn, "	2,053,250	1,576,000
Rye, "	2,500	2,700
Oats, "	489,000	312,250
Peas, "	1,200	18,700
Malt, "	89,200	48,000

The exports of breadstuffs from this port ending with Friday from the previous Friday, were

	W'k end'g 8th.	W'k end'g 15th.
Flour, barrels	45,500	88,000
Cornmeal, barrels	3,250	5,800
Wheat, bushels	540,060	647,300
Corn, "	978,900	1,149,000
Rye, "	9,100	7,800
Peas, "	2,300	3,550
Oats, "	3,200	6,350

Although there was a large increase of exports, as may be seen, yet the hoard of wheat in warehouses here increased during the week, 467,450 bushels; that of corn 321,500 bushels; and of oats, 93,750 bushels. Some demand arose during the week for oats for the French market, contracts having been made for 16,000 bushels for Havre at 6½c. freight per bushel of 32 pounds. There was a severe break in rye; and barley, being out of season, was utterly neglected. Flour went up 5 to 15c. per barrel and corn meal, from 5 to 10c. per barrel. Millers and others who buy cereals for prompt sale are strongly urged across the Atlantic, not to buy more than they actually need in order to keep down prices until the present harvest comes into market. Our greater promptitude in bringing our crops to market gives us some advantage over Russia and most of our other competitors; but not as much as might be thought, owing to the fact that contracts are generally made ahead, and thus Russian exporters, by making contracts now for future delivery, help to fix prices for our products already in the market. Heavy buyers in late Summer and Autumn do not want all their supplies at once, but arrange for them to arrive during the season, so that a great deal of the purchases made in our markets for future delivery—"option"—are *bona fide*, although a majority of them are undoubtedly speculative—mere gambling on a rise or fall in the meanwhile. The approaching danger of a fall in prices of agricultural products arises mainly from the tendency to rush them at once to market so soon as they can be got ready for sale. Even with a very short harvest, this practice would be sure to overload the market for a time, and thus reduce prices; speculators would then hold the goods and realize all the profits from subsequent rises. Yet much can be said in favor of the farmer who sells his crops as soon as he can, at *paying figures*.

(St. Louis Chronicle.)

Advice is cheap,—dreadfully cheap. But we must be true to our instincts of humanity and tell our suffering friends to use St. Jacobs Oil, and surprise their rheumatism and their friends also at the result. J. D. L. Harvey, Esq., of Chicago, says: I would be recreant to my duty to those afflicted did I not raise my voice in its praise.—*Adv.*

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, July 16.

Cincinnati.—WHEAT in good demand. No. 2 Red Winter, $1,16@1 17; receipts 17,000 bushels; shipments, 24,500 bushels. Corn strong; No. 2 Mixed, 51c. Rye firm. No 2, $1,05@1.07. Pork firm at $18. Lard higher at $12.40. Bulk meats quiet, but firm; Shoulders, 6¼c; Clear Rib, 9¼c. Bacon strong; Shoulders, 7¾c; Clear Rib, 10c; Clear Sides 10¾c. Butter dull and unchanged. Sugar firm and unchanged. Hogs steady; common and light, $4.90@6.50 packing and butchers' $5.90@6.85; receipts 1,500 head; shipments, 855 head. CHEESE.—Fancy creamery sells at 23@24c. prime do. at 21@22c, choice Dairy at 15@17c. prime to choice Western Reserve at 15@16c. prime to choice Central Ohio at 12@14c. and common do at 9½@11c. per lb. prime factory is firm at 8@8½c. while lower qualities range down to 2c. per lb. EGGS have met a light demand during the week, and prices declined to 9½@10c, but under small receipts the market closes firm at 10@10½ cents per doz. for fresh. POTATOES are in only moderate local demand and are selling readily at $2 25@2.50 per bbl. for prime to choice Early Rose. CABBAGE continue strong under a light supply, at $1.65@1.75 per bbl., and 3 00 per crate. ONIONS.—Prime to choice sell at 3.50@3.75 per bbl. but Bermuda are dull at $1.00 per bushel crate. TOMATOES are in better supply; prime to choice sell at $2.50@3.00 per bushel in crates and stands. HOPS are in good request, and prices are steady for prime to choice Eastern at 22@24c per lb. HEMP.—The offering are light, but there is only a jobbing demand. Rough Kentucky sells at $125 per ton from store. Single dressed sells at 8c. and double do at 10c. per lb from store. SEED.—There is little demand and prices are not much better than nominal. Clover is jobbing at 8c. per lb. Timothy at $2.65 and Hungarian Grass at $1,00@1.05 per bush.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 16, 1881.

BEANS AND PEAS.—Small receipts of beans together with the late free export sales have had a good strengthening influence upon the market for standard white beans of fine grade; poor lots or stock that shows indications of not keeping sound in hot weather dull and rather at buyers' option. Green peas quiet at $1.50@1.55. Southern B. E. peas have a small call at $3@3.10 ₱ 2 bu. bag.

Marrow beans, prime, $2.43¾; other, $2.25@2.35; medium, prime, $2.40; other, $2.20@2.35; pea, $2.30@2.50 white kidney, $2.35@2.45; red kidney, prime, $1.55@1.60; fair to good, $1.40@1.50; black or turtle soup, $1.30@1.35.

Receipts for week, 1,840 bush.
Exports do. 1,190 pkgs.

BEESWAX.—The demand is small but there is not much stock here and the market is steady and firm at 23½@25c.

BUTTER.—The Summer trade helps out admirably, but with the falling off that must ensue as the hot term advances, nobody predicts a steady continuance of the present comparatively high rates. There are some worthy opinions that intimate that there is considerable risk ful speculation both here and in the country. Much depends upon the eventual wants of shippers, but home buyers begin to point to the known liberal cold storage, especially if a seller attempts to use a "light supply" theory. The market is off about ½c. since last week for State and Western, which has to be perfect to make the upper figures. Only choice fows ladle-packed makes 18c. The weather is warm and butter loses a showing value at such a time.

Creamery—Western, good to prime, 21½@22½c: State and Penn, 22@23½c.; poor, 20½@21c.; sweet cream, 22½@23½c.: State pails and h'f tubs, choice, 21c: fair to prime, 18@20c.; Welsh tubs, 18@21c.; poor State, 16@17c; firkins yellow, 20@22c: Western imitation creamery, 17@20c.; dairy fine 19c.; other, 15@18c.; factory or ladle-packed, best, 17@18c.; other, 13@16c.; very poor Western, 11@12c.

Receipts for week, 43,240 pkgs.
Exports for week, 12,756 do.

CHEESE.—Our dairy friends should be delighted with the marvelous movement that has attended cheese during the past two weeks. Receipts have run heavy—never larger than for this week—yet right in the midst of hot weather trade has kept up an active jump with prices wavering only slightly, compared with many former similar surroundings of the market. The fact is a good many orders had to be filled and all demands have included a call for fine grades and a good scale has been established for even serviceable lines. About 40,000 boxes remain unsold but it is confidently thought they will be wanted for early steamers. Ohio and Wisconsin have done well, skims are better.

State factory, choice, colored, llc. do. white, 10¾c; fair to prime, 9½@10¾c; poor to fair, 9@9½c.; Ohios, fair fine 9¾@10c; other 7@9¾c; Wis poor to fine 8¾@10c.; part skimmed, 6@8c.; full skims, 3@5c.

Receipts for week, 187 000 boxes.
Exports for week, 138,765 boxes.
Liverpool cable, 56s.
Steam to Liverpool, 25@30s.

COTTON.—There has been an active market attended with better prices. All interests have participated in the trading but the market obtained its start in the "covering of shorts." New crop will be a little late and old is in good control.

Quotations are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas.

STAINED.

Good ordinary	7⅞	Low middling	9¾
Strict good ordinary	8¾	Middling	10 13-16

Futures closed irregular at a decline of 17@20 points on July and August and 9@11 points on the later months; sales 106,800 bales. Prices paid:

July, 11.83@11.92c.; August 11.64@12c.; September, 10.92@11.25c.; October, 10 47@10.70c.; November, 10.31@10.48c.; December, 10.39@10.40c.; January, 10.41@10.73c.; February, 10.59@10.70c.; March, 10.66@10.72c.

DRIED FRUITS.—There is no change to note: business is moderate and prime lots are held with confidence with supporting light crop advances. It is asserted that evaporators in some peach sections will be almost idle this season, and apples will be mostly wanted green. Small fruits partake of the strong feeling.

Apples, evaporated choice, 9¼c.; fair to prime, 8@9c; North Carolina sliced, common to best 4¼@5c. Va. do. 4¼@4¾c; Tenn in bbls. 4@4¼c. do. bags 4@4¼c; State fine cut 4¼@4¾c., quarters 4¼@4¾c; Western, 4@4¾c; evaporated peaches peeled 25@28c; unpeeled 13@14c; sun-dried peeled 17@20c; unpeeled halves 5@5¾c. Plums 10@11c. Blackberries 7¾@8c. Cherries 14c. Raspberries 24c. Whortleberries 11@11¾c.

Receipts for the week, all kinds, 220 pkgs.
Exports dried apples, 900 pkgs.

EGGS—Receipts for week, 8,167 bbls.; do. last week 6 837 do. The demand has been moderate, especially for Western; buyers are shy of stock coming from a distance when the weather is damagingly hot all along the routes. Prices are steady for first class stock and large receipts are not urged.

Near points, 19@19½c.; State and Pa., 17½@18c.; Western, fresh, 16@16¾c.; Canadian, 17c.; low grades and ice-house parcels 14¾@15¾c.

FLOUR.—There has been a very fair business in low grades for export, beyond such wants only a fair regular business is reported. The market will be subject to alternations until wheat crop estimates are more decided. At the moment high figures are ruling.

No. 2, ₱ bbl., $3.10@3 75; State and Western superfine, $4 00@4 70; city mills extra, $6.25@6 50; Spring wheat do. $4.80@5.05; Spring XX and XXX, $5.25@7.00; patents, $6.50@8 50; Ohio round hoop shipping, $5.00@5.40; trade brands, $5.50@6.25; St. Louis extra, $5.10@5.50; do. double extra, $5.65@6 35; do. family, $6.40@7.25; South'n shipping, $5.40@6.00; do. XX and family, $6.25@7.50. Rye, $5.00@5.40. Corn-meal, Brandywine, $3 40@3.50; Western, $3.00@3.30.

Receipts of flour for week, 114.900 bbls.; do. corn-meal 7,250.

Exports of flour, 71,000 bbls.; do. corn-meal 6,975.

FRESH FRUITS.—The variety is large and frequently during the week berries have been forced down to preservers' prices. The offering of pears is quite good for the early date. Apples have a slow sale. Gathered reports from all points are very blue for the peach crop. The young orchards at new points of cultivation will not begin to furnish even a moderate supply.

Apples, Sweet Bough, Jersey, ₱ bbl. $2.50@3; Sour Bough, $2@2.75; Red Astrachan, south'n ₱ bu. crate, 75c.@$1; green southern do. 40@75c.; do. ₱ bbl. $2@2 25; Pears, Bartlett Sav. ₱ bu. crate $4@5; Clapp's Favorite, Norf. $3.50@4; Jargonelle, Md. ₱ bbl. $6@7; Bell., Md. $5 50@6; Burre Gifford, Md. ₱ ½-bu. crate, $1@1.25; Cooking pears, ₱ bbl. $3.50@4. Blackberries, Wilson, Jersey, ₱ qt., 10@12c.; Md. and Del 8@10c; wild, 4@7c. Whortleberries, ₱ bush. $1. Raspberries, Antwerp up-river ₱ 3-to-qt. cup, 3@4c.; natives do. 1½@2½c.; Brandywine, Jersey, ₱ pint 5@6c.; Md. and Del. 4@5c; Black Caps, up-river 2½@3½c. Jersey 2@3c. Gooseberries, green, prime, ₱ bu. $1.25@1.50. Currants, Cherry, ₱ lb. 3@4c.; red, small, 1½@2c.; black, 5@7c. Peaches, Md. Hales, ₱ crate, $1.50@1.60; North Carolina ₱ bush. crate $1@3 50; Ga. ₱ 3-to-bu. box, $2@3.50. Plums, Wild Goose, 8c. ₱ qt. 10@15c.; Beach 4@6c. Watermelons Fla. & Ga. ₱ 100. $15@25; N. C. $12@15. Nutmeg melons, Norfolk, ₱ bbl. $2.50@3. Peanuts in fair demand and steady. Pecans unchanged. Peanuts, Va. hand-picked ₱ lb. 5@5½c; fancy 5¾c; extra prime 14½c.

GRAIN.—Crop reports of wheat have been less favorable and the market has been in favor of sellers in prices without leading up to large sales. Cable rates have been discouraging and not at all in keeping with our home prices. Sales of corn have been a prominent feature with prices inducing exportation. On the whole however, a good volume of trade can be noted, especially as freight room is being largely absorbed by hurried produce, including cheese and provisions. Oats speculatively active. Rye dull; small stock to deal in.

Wheat, Spring $1.00@1.24; do. No. 2. $1.20@1.22; do. No. 3. $1.15@1.17; red Winter No. 2, $1.23@1.23½; red Winter $1.12@1.32; white Western and State $1.17@1.27. Rye, 94@98c. Oats, white No. 1, 46c.; white No. 2, 43@43½c.; white No. 3 42c; mixed No. 1, 43c; do. No. 2 42½@43c; do. No. 3 41@42c; Corn, Western mixed 57@57½c.; do. No. 2 56@57c.; do. do. yellow 58@58c; do. do. white '58@58¾c; Southern yellow 57@59c.; do. white 58@62c.

Receipts for week, wheat, bush., 991,400; corn, do 1,572,900; oats do. 291,500; rye, do. 1,092; malt, do. 48,400; rice pkgs. 705.

Exports for week, wheat, bush 450 305; corn, do. 1,197,200; oats, do. 29,978; rice, pkgs.. 1,875.

HAY AND STRAW.—Exports for week 4 016 bales hay. Receipts have been checked by low prices and pressing farm work and the market is temporarily firmer for hay. Straw quiet.

Choice retailing timothy hay 80@85c. ₱ 100 lbs.; second quality, 60@70c, do.; shipping 45@50c. do; clover mixed 40@50c; pure 35@40c. Long rye straw 70@75c; short do. 45@55c.; do. other grain, 45@50c. do.

HOPS.—There is no prominent interest. Brewers' wants seem to be small, and cheap hops, that is, cheap for the buyer, comprise the call.

State, crop of '80, choice, 20@22c; good to prime 18@19c; fair to good, 13@16c; poor to fair, 11@13c; Eastern, 11@18c.; '79's, fair to prime, 12@15c.; olds, 5@8c.; Wis, 14@22c.; Cal and Oregon 19@23c.

Receipts for week, 353 bales.
Exports for week, 38 bales.

MILK.—The weather has ruled good for use and a reasonable supply of commission cans have met fair prices. The average made was $1.42 for cans of 40 qts., prices ranging $1.25@1.60.

POULTRY AND GAME—Dressed poultry is scarce and generally bringing good prices. Quotations are thought to be rather more than the market will stand with a fair addition to receipts.

Turkeys, Phila. choice ₱ lb 16@18c.; State & West. 14@17c; Phila chickens 26@28c; N. J. 24@26c; West. 23@25c. fowls, Phila. d. p 19@20c.; Bucks Co. and N. J. d.p. 18@19c.; N. J. scalded 17@18c.; State and Western 17@18c; do. d.-p. 18@19c.; coarse 14@16c.; Ducks—Spring, 18@19c.; old, 12½@14c.; Squabs, white ₱ doz. $1.25@2.50 do. dark, $1 50@1.75.

Live chickens plenty and weak; fowls scarce and high; turkeys wanted.

Spring chickens prime ₱ lb 23c.; other 19@21c. Fowls, ₱ lb. 17@18c roosters, 8@10c.; turkeys, 13@14c.; ducks, ₱ pair 60@$1; geese, extra $1.75; other $1.00@1.50; pigeons, 25@50c.

In game there is nothing plenty enough for commercial quotation.

PROVISIONS.—Pork has shown an energetic movement quite welcome after the long pause that has prevailed. Provincial and W. I. buyers have operated very liberally, and prices feel the buoyancy that arises when stock goes out for use. Cut meats have a fair demand, though bacon is rather sluggish. Lard retains its "boom," and with settlement of contracts and cornering of spot prices are firm and high.

Pork, extra prime, $14@14.50; Western mess, new, $18@18 50; old, $16.25@16.63. Lard, steam Western ₱ 100 lbs, $13@13.25; prime city, $12 50@12 50. Hams, smoked city, 12@13c.; pickled Western, 10½@12; Shoulders: smoked city, 8½; pickled, 7½; rib bellies, pickled, 9¾@10 Bacon, long clear, 9¾@9¾. Beef, mess, bbl., 12@14c; India mess, tcs. 26@28c; beef hams bbls. $23@24.

Receipts for week—Beef, bbls and tcs. 807; pork, bbls. 15,952; Cut meats, pkgs. 15,530; lard, do 16.478. Exports—Beef, bbls and tcs. 2,241; pork, 4,261; cut meats lbs. 9 855,202; lard, 4,259,765.

RICE.—The market is firm. We quote Carolina and La. common to fair at 4¾@5¼c; good to prime at 5¾@6¾c.; choice at 6¾@7¼c.

SALT.—The quotations for leading brands are: Ashton's at $2.50; Higgin's $2.40. Holmes extra sifted $2.40; Deakin's at $1.25; Evan's $1.20. Washington's $1.25; Marshall's at $1.25; Virden's at $1.20; Worthington's at $1.20; Mediterranean at 25c.

SUGAR.—Refined quoted: Hard sugars—crushed ₱ lb 10¾c; do. powdered 10¾c; do. granulated 10¼@10¾c; do. cut loaf 10¾c; confectioners' "A" 9¾@9¾c; coffee "A" standard 9¾@9¾c; do. off "A" 9¾@9¾c; white extra "C" 8¾c; extra "C" 8¾@8¾c; "C" 7¾@8¾c; yellow 7@7¾c.

TOBACCO.—There has been a large business in seed leaf at about former prices.

VEGETABLES.—Long Island and N. J. now supply the market with potatoes and some to spare for Havana use. Prices low range $1@1.50 per bbl. The leading kinds of garden truck are abundant and cheapening daily.

Sweet corn, Jersey ₱ 100 $1.25@2.50; Green Burlington do. 75c@$1; Green peas, L. I., ₱ bag, 50c; wax beans 50c, string beans 50c; cucumbers ₱ 100 90c@$1; Norfolk, ₱ bu. crate, 20@40c; egg plant Phila ₱ doz. $3@3.50 Fla. ₱ bbl. $2@5. Tomatoes Phila ₱ bskt. $1; Hackensack ₱ bu. $3 50; Md. prime $2@3; Nfk 20@40c.; squash Norfk marrow ₱ bbl. 75c@$1; L I. ₱ basket 30@40; cabbages, Flat Dutch ₱ 100 $3@4. Wakefield $3.50@3; beets, L. I. ₱ 100 bchs $1.50; onions, Nfk yellow ₱ bbl. $3.50@3.75; Md. $3.75@4; lettuce ₱ bbl. 30@50c; carrots ₱ 100 bchs $1@1.50; radishes 50@75c; white turnips Jersey $1.50@3.50; turnips Russia ₱ bbl. 75c@$1; cauliflower, ₱ bbl. $3@4.

WOOL.—The market is rather quiet, but not more so than was to be expected after the late free business throughout the country and prices have a sturdy grip upon the points they have attained.

Ohio, Penn, and W. Va. XXX and picklock, 43@45c.; X to XX, 40@43c.; No. 2 to No. 1, 40@45c. coarse, 34@38c.; combing 40@45.

State and Western X and XX, 39@41c.; No. 2 to No. 1 38@44c.; coarse 32@36c.; combing, 40@44c.; combing unwashed 30@34c.

Va., W. Va. and Md. unwashed medium 28@31c. Ga. and Lake unwashed medium 28@32c.; coarse 23@26c; burry and slightly burry 16@23c; Cal, Spring northern, free, 34@37c.; middle counties, free, 28@32c.; southern, 23@27c.; low grade and burry, 20@23c. Fall, low grade and burry 16@21c. Texas—choice, free, 28@32c.; fair to good, 24@28c.; low grade and burry 17@20c. Pulled super 38@42c.; extra 35@38c; No. 1, 30@33c; combing, 35@40c.; lambs, 38@40c. Two washed, fair to choice, 35@44c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, July 16, 1881.

BEEVES.—Receipts for the week 13 031 head; do last week 11,414 do. Owing to unfavorable dressed beef reports there was a very cautious movement at the stock yards and a general disposition to restrict business on the part of the buyers. Good and prime cattle were held about steady, but sold slowly; medium to fair native steers of 1,150 to 1,200 lb average were in most demand and favored the seller; but very common natives and the poorer quality of Texas cattle were dull and lower—only a fraction, perhaps, at the Jersey City market place, but fully ½c. ₱ lb at Sixtieth street. The offerings included in car-loads of Ohio distillery-fed cattle, probably the last of the season. These cattle were shipped from Cincinnati during the hot weather of the early part of the week and 34 head died on the cars. The nature of the food upon which these cattle were fed during the Winter and Spring, and up to the time of shipment, is calculated to make them very susceptible to the heat, and it seems as though it would have been an act of prudence to have marketed the cattle earlier in the season. Three car-loads were light, but well fattened, and were mainly sold at 11¾c. to dress 56 lb; 8 car-loads were poor cattle, evidently the "tail ends" from some distillery, and sold at 9¼@10c. to dress 55@56 lb. Six cars of through Cherokees sold at 7¼c. to dress 55 lb; 9 cars through Texans at 8¼@8½c.; 2 cars of corn-fed Colorados at 9¾c. to dress 25 lb; 2 cars of Colorados, fed in Ohio, at 10½@11c. to dress 56 lb; and the range for ordinary to choice native steers was from 10c. to dress 56 lb to 13¾c. to dress 57 lb. Bulls were freely offered and very dull. About 2 cars of State grass bulls changed hands at $2.90@3 ₱ 100 lb, and more than 50 head will be carried over for which $3.75 was the highest price bid.

SHEEP AND LAMBS.—Receipts for the week 33,193 head; do. last week, 23,901 do. With a free supply trade was slow and only choice lots sold at fair prices. Common stock lower. Sheep quoted 4½@6c; Va., Ky. and Tenn, lambs 6¾@8c.; Penn. 8¾@8¾c.; N. J. 9@9¾c.

SWINE.—Receipts for the week 25,491 head; do. last week 17,418 do. Tone of market not strong; 6¾@7¾c. live corn-fed Western; city dressed State 8¾@9c.; do. Western 8¼@8¾c.

VEAL CALVES.—Arrivals have been larger and prices have declined; high beef helps sale.

Live N. J. prime to choice, 7¾@7¾c; do., tate, 7¼@7¾c.; poor to good 5¾@7¼c.; Mt. Hollys, 6¾@7¾c.; buttermilk, 3¾@4½c.; weather too warm for dressed; a few river quoted 10@13c.

MILCH COWS.—There have been moderate sales at $30@50 per head for fairest sort of cows; prime milkers would sell in a small way at $60@65.

FARMING FOR BOYS AND GIRLS—NO. 28.

HENRY STEWART.

Preparing Food for Stock.

THE purpose of food is to support life. It does this by restoring the waste of the body caused, in greater part, by the motion of the muscles. Every time an animal moves a limb; every motion of the heart which forces the blood through the veins; every movement of the lungs which draws in or forces out the breath; all these motions use up a certain portion of the fibrous tissue of the body, of which the muscles are formed. This lost tissue is replaced by matter contributed by the blood. The blood is restored, as we have seen, from the food which is prepared for this purpose by the digestive organs. It follows, therefore, that the more the muscles are exercised, the more food is required to replace the loss occasioned by this motion. If an animal should be shut up in the dark and do nothing but sleep, it might live for several weeks without any food. A horse has been kept without food for 43 days in a condition of perfect idleness, but when kept at work without food it was unable to rise on the eleventh day. The difference shows the amount of waste caused by the exertion of the muscles in the performance of work.

It is clear then, that even in eating the food, which is a work requiring muscular motion, a portion of the food is used up. It is precisely the same as if a steam engine should lift the coal, by which the steam is produced to work the engine, crush it and put it into the furnaces. As in this case a portion of the power of the engine would be expended in feeding the fire, and of course some of the fuel is expended in producing this power, so in an animal, a portion of the food is actually used up to produce the vital force which is expended in masticating, digesting, and assimilating it, and carrying it in its completed form, as blood, to the small vessels, the capillaries, which serve it out, as it were, to the exhausted muscles as fresh matter, to replace their wear and tear. For this reason it is necessary sometimes to prepare the food so that it may be eaten and digested more easily, and labor—which is loss—saved to the animals. As food costs money, its saving is money saved; and therefore we may well consider as a practice of economy, how far we may profitably go in saving food in this way.

There is but one limit, and that is the health of the animal. If we injure the health by our manner of feeding, no saving of food would recompense us; and in considering how we may save food by preparing it, whether by grinding it, cutting it, cooking it, soaking it in water or in any other way, this point must never be lost sight of. Grinding grain is practised because it is an economy. The meal is more easily eaten than the whole grain, and it is more easily and perfectly digested; but still it is necessary to secure its proper mastication and mixture with the saliva, before it is swallowed, or it would not be wholly digested and might be more wasteful than feeding whole grain. We avoid this danger by mixing the meal with cut fodder, and we wet the fodder to make the meal mix better with it. Some persons believe that it is better to cook the food by steaming it, but it is doubtful if the saving—if there is any at all—is sufficient to pay for the extra labor.

This whole question is one which can only be solved by experiments. We can never reach a satisfactory knowledge by reasoning upon it; and if we could in one case, another could never be decided by that one. So that the farmer must try for himself, when he understands the facts, in what way he can prepare the food for his stock, so as to get the most value out of it and yet not to spend more in labor than the saving would amount to. It is very certain that there is a great saving in grinding the grain and in cutting the fodder for horses, cows and oxen; and in grinding or cooking the grain for pigs, in many cases; but there are cases in which there is no saving. Where corn and hay are very cheap, this saving is not equal to the cost of the work done; but where grain and hay are dear, it may be well worth the labor spent; more especially when the work is not paid for in money, and there is spare time to do it. But it is very doubtful if it will pay to go further than this in the preparation of food for stock.

THE YOUNG QUERIST.

P. M., West Haven, Conn., asks, 1, to what genus of plants does the nettle belong, 2, why does the sharp prick of a nettle produce itching and swelling.

ANS.—1, The nettle belongs to the genus *urtica*, which name is probably derived from the Latin word *urere* meaning to burn. 2. The stinging hair of the nettle has a little bulbous cell in which an irritating juice is contained, and when the sharp point or hair is broken off this juice flows at once into the wound and produces pain. Under the microscope the contents of the nettle-hair may be seen in constant motion, it is said.

N. E. B., Berlin, N. Y., wishes to know when and where Mary, Queen of Scotts, was beheaded.

ANS.—On February 8, 1587, at Fotheringay castle, Northamptonshire, England.

J. A. S., Mercer, O., asks if Olive trees can be grown so far north as Ohio.

ANS.—Only as greenhouse plants. They thrive well in the Southern States.

S. M., Leeds, N. Y. wishes to know when to trim Norway Spruce hedges.

ANS.—About the beginning of August.

O. N. C., Xenia, O., asks what is the best manure for flowers and house plants.

ANS.—Liquid manure from the barn yard, diluted so that but little color remains is probably the best.

THE DRAGON FLY.
(Libellula trimaculata.)

I IMAGINE that there are very few boys and girls in the country who do not know the Dragon Fly when they see it. It may be they have not all heard that name applied to it; if so, they may call it the Devil's Darning Needle, or Spindle for all these names are used in the country in speaking of this insect. It is probably this terrible name of Devil's Darning Needle that inspires such a fear in the minds of the children whenever they see one flying about. They know that it is the office of the

FIG. 352.

needle to pierce, and if this insect has anything to do with his Satanic majesty it must have been sent into the world to pierce and sting people. But no; the bright-winged little fellow wouldn't hurt anybody for the world; so, boys and girls, you need not let that curious idea that the Darning Needle is going to fly into your ears haunt you any more. But I wouldn't say that gnats, mosquitoes, bugs, or almost any soft-bodied insect would escape so easily, for they are choice food for Dragon Flies, and it is these that they are looking for when they dart about with such swiftness and ferocity.

These insects pass the larval state in the water, and in crawling along the bottoms of pools they find their food, in the shape of insects and little pin-fishes. I just said that they crawl along the bottom, which is partially correct, but they have, so we are told, a valvular apparatus at the end of the tail by which they draw in and expel water as a means of locomotion. They probably put this machinery into operation when they "can't touch bottom," so they are never without locomotive facilities. They remain in the water several months and change their skin several times, but when the time comes for their final transformation they crawl out upon the bank or upon a neighboring plant, where the pupa skin bursts open and the beautiful winged insect becomes an inhabitant of the air. It is said that these insects are two years in reaching their perfect state, after which their wings become torn and discolored, their strength fails, and in a few weeks they die. H. M

The Puzzler.

GEOGRAPHY PUZZLE.

I was awakened one morning by a city of China, which was perched on a fence near my window. From an adjoining room I heard a division of Great Britain, and I called a river of North America to make a fire, as I felt a division of South America. On going down stairs I found that one of the lakes of North America had spilled a division of Europe on my highly-prized city of Belgium while putting on the table my breakfast, consisting of a division of Asia, seasoned with a city of South America; also a cape of Massachusetts, an island of Oceanica, a city of France stopped with a city of Ireland, and a basket containing a river of Africa and other fruits. I paid a division of Africa for my breakfast, and then I asked one of the islands of Oceanica for some sugar to feed an island of Africa that was hanging in my chamber.

☞ Answer in two weeks. RUTH.

ACROSTICAL ENIGMA.

My first and my second are seen on the mountain,
My third and my fourth in the glade and the fountain;
My fifth and my sixth in the meadows are found,
My seventh and eighth in deep forests abound,
My ninth is in the desert,
My tenth has gone to ride,
My eleventh is in Italy,
My twelfth goes with the tide,
My thirteenth you will find is in the number three
My whole is very welcome as it often comes to me.

☞ Answer in two weeks. MARY WALEY.

Sabbath Reading.

WHAT I LIVE FOR.

I LIVE for those that love me,
Whose hearts are kind and true,
For heaven that smiles above me
And waits my spirit, too;
For all human ties that bind me,
For the task by God assigned me,
For the bright hopes left behind me,
And the good that I can do.

I live to learn their story
Who've suffered for my sake,
To emulate their glory,
And follow in their wake;
Bards, patriots, martyrs, sages,
The noble of all ages,
Whose deeds crown history's pages,
And time's great volume make.

I live to hail that season
By gifted minds foretold,
When man shall live by reason
And not alone by gold;
When, man to man united,
And every wrong thing righted,
The whole earth shall be lighted
As Eden was of old.

I live to hold communion
With all that is divine,
To feel that there is union
'Twixt nature's heart and mine;
To profit by affliction,
Reap truths from fields of fiction,
Grow wiser from conviction—
Fulfilling God's design.

I live for those that love me,
For those who know me true,
For the heaven that smiles above me
And waits my spirit, too;
For the cause that lacks assistance,
For the wrongs that need resistance,
For the future in the distance,
And the good that I can do.

SELECTIONS FROM WRITINGS OF DR. E. H. CHAPIN.

THE true Church is not an institution to be kept apart from the world because the world "is common and unclean," but a vital heart of truth and love, beating with the life of Jesus, and sending abroad its sanctifying pulsations until nothing shall be common and unclean.

Christianity is, in society, like that agency in the physical world which drives suns and systems on their tremendous track, yet binds them in glittering harmony, holds them to a central order, fills them with joyful life, and illuminates them with universal beauty.

"Our life is what we make it!"—an insignificant game, or a noble trial; a dream or a reality; a play of the senses worn out in selfish use and flying "swifter than a weaver's shuttle," or an ascension of the soul by daily duties and unfaltering faith to more spiritual relations and to loftier toils,—to the company of the immortal,—to the presence of God and the fellowship of Christ.

You would feel that it was a great thing to stand upon the walls of a lonely fort, with your country's flag floating over you, knowing, perhaps, that your country's freedom depended upon your vigilant eye and quick ear. You would think it a great thing to stand upon the deck of a ship, keeping watch at night, knowing that the safety of all those on board depended upon your alertness and activity. Stand at the portals of your own soul, with the signal-flag of God's law floating over you, and feel what important results depend upon your care and watchfulness; stand upon the deck of the great social ship, watching the interests committed to you, and feel how much depends upon you. Drive every nail you drive, do everything you do, however small and significant, as though God's eye was flashing upon you.

I do not want any of that kind of respect for the clergyman that will check a man from swearing in his presence. "Oh, I beg pardon; I see there is a minister present." Never beg my pardon for swearing. If you dont care about offending God you need not trouble yourself about offending me. O, this miserable, mean kind of respect that is felt for the mere formalities and decencies of religion, when Jesus Christ is turned out of doors.

IT is not for him who excepts the spiritual interpretation of life and nature to affirm or fear any real antagonism between the world within us and the world without. * * * The work of nature displayed in all these forms of being is not merely analogous to the divine word; the work of nature is the divine word.—Dr. E. H. Chapin.

IF there be any true religion in us, it is much more likely to be discovered and drawn into actual exercise by an exhibition of the glory and grace of Christ than by searching for it in the rubbish of our past feelings. To discover the small grains of steel mixed among a quantity of dust, it were much better to make use of a magnet than a microscope.—Andrew Fuller.

THE pupils of a certain rabbi asked:—"Does a man know the day of his death so as to repent the day before?" "Not so," was the answer; "but so much the more should the man strive to grow better every day, because he may die the next. So all his days will be spent in repentance, as it is written—'Let thy garments be always white.'"

THE reason why the men of the world think so little of Christ is, they do not look at Him. Their backs being toward the sun, they can see only their own shadows, and are, therefore, wholly taken up with themselves, while the true disciple, looking only upward, sees nothing but his Saviour, and learns to forget himself.—Payson.

Implements and Machinery.

25th Year.

GRAIN & FERTILIZER DRILLS.
Complete Force Feed, Rubber Springs, AUTOMATIC CUT OFF, saving Fertilizer. Agents wanted in territory not occupied
☞ Descriptive Circulars sent on application.

"Victor" one-horse Wheat Drills
(3 and 5 hoed,)

FOR SOWING WHEAT, RYE, BARLEY, in fallow Ground or in standing corn.
Force feed; simply constructed. The five hoed is adjustable for different widths, and is just what every small farmer ought to have, saving the price of a Two-Horse Drill.
Manufactured only by EWALD OVER,
(Send for Circulars.) Indianapolis, Ind.

MATTHEWS' SEED DRILL
The standard of America

Admitted by leading Seedsmen and Market Gardeners everywhere to be the most perfect and reliable Drill in use. Send for circular. Manufactured only by
EVERETT & SMALL, Boston, Mass.

The New Buckeye Force Feed

GRAIN DRILL.
ALSO
THE NEW BUCKEYE
Combined Force Feed Grain and FERTILIZER DRILL.
AS IMPROVED FOR 1881.
Over 100,000 Now In Use.

The Buckeye has the largest sale of any Grain Drill in the world, and they are pronounced by all to be the most *perfect* SEEDING MACHINES in the country. No Grain Drill ever made gave such UNIVERSAL SATISFACTION. It is the best force-feed in the market. Our Fertilizer Sower has a positive force-feed and has no equal. Send for our circular giving Illustrations of new improvements. Address P. P. MAST & Co.,
Springfield, Ohio.

Branch Offices, 216 N. Broad St., Philadelphia, Pa.
11th St. and Clarke Ave., St. Louis, Mo.

Also manufacturers of Buckeye Broadcast Seeders, Buckeye Hand Sowers, Buckeye Riding Cultivators, Buckeye Walking Cultivators, Buckeye Plow Sulky and Buckeye Cider Mill.

PERSONAL ITEMS.

Judge Buren R. Sherman, the republican candidate for governor of Iowa, is not a brother of Gen. and Senator Sherman. He comes of Massachusetts stock.

Adelina Patti has signed a contract for a season of concerts in the United States, beginning at Steinway Hall, in New York, on November 9th. So says a cablegram of the 14th.

Senator Lamar, of Mississippi, has two married daughters and one who is still a school girl. He has also a little grandson, who is his namesake. His house at Oxford is a plain one. He is very fond of his registered Jersey cattle.

A lady in Taunton, Mass., received last week from Europe a bouquet containing, it is claimed, a clover from George Elliot's grave, a violet from Melrose Abbey, a buttercup from De Quincey's grave, a sprig of ivy from Walter Scott's old home at Abbotsford, and a bluebell from the grave of Helen Macgregor, near Loch Lomond.

The executors of Lord Beaconsfield have sent in the necessary papers for probate, and have sworn the gross assets, including insurances, at £75,000, which is reduced by corresponding charges and debts to a little over £30,000, upon which probate duty is paid; but this amount includes the valuable library, the heirlooms, and other inconvertible property.

The year 1878 was strangely fatal to Italy. The first Italian General, La Marmora; the king of Italy, Victor Emanuel; the first infallible Pope Pius IX; the first astronomer, Padre Secchi, and the first international arbitrator, Sciopis, died in less than three months. Monuments to each have now been put up and are continually being multiplied.

In the machine constructed by Herr Amadeo Gentilli, of Leipsig, the natural movements of the mouth in speaking produce action in a delicate series of levers, by which electric contacts are made and broken and the signs are regularly recorded similar to those of the Morse alphabet—a good thing for deaf people if it could be made cheap and easily portable.

The late Duke of Richmond, who was aid-de-camp to the Duke of Wellington all through the Peninsular war was shot down at Salamanca. The ball was never removed; and he carried it to his death. A few months after he received it he was able to resume his duties and was present at the after battles of the campaign and at Waterloo. Sir Richard England, then a Captain in the Twenty-third Fusileers, was shot down at the siege of Badajos, and carried also the ball to his death at the age of 83.

[Troy (N. Y.) Morning Telegram and Whig.]

Rubbing the Midnight Oil.

In the Philadelphia Times of recent date we notice an item referring to the miraculously quick cure of a prominent druggist of that city, Mr. J. M. Higgins, Germantown Road and Morris Street, who had an awful attack of rheumatism of the knee. He applied St. Jacobs Oil at night, and next morning was well and in his store as usual.—*Adv.*

THE CYCLOPÆDIA WAR.

The month of July, 1881, witnesses the completion of the largest and most important literary work this country and the century have seen. It is the Library of Universal Knowledge, large type edition in 15 large octavo volumes, containing 10 per ct. more matter than Appletons' Cyclopedia, at less than one-fifth its cost, and 20 per cent. more than Johnson's Cyclopædia, at a little more than one-fourth its cost.

Victory

Chambers's Encyclopedia, which forms the basis of the Library of Universal Knowledge (the last London edition of 1880 being reprinted verbatim as a portion of its contents), is the laborious product o the ripest British and European scholarship. It has developed through a century of Cyclopædia making, its various editions having been many times revised, in successive years, till it has come to be universally recognized, by those competent to judge, as standing at the very front of great aggregations of knowledge, and better adapted than any other Cyclopædia for popular use. It contains such full and important information as the ordinary reader, or the careful student, is likely to seek, upon about 2,500 subjects, in every department of human knowledge. Chambers's Encyclopedia, however, is a foreign production, edited and published for a foreign market, and could not be expected to give as much prominence to American topics as American readers might desire. To supply these and other deficiencies a large corps of American editors and writers have added important articles upon about 15,000 topics, covering the entire field of human knowledge, bringing the whole number of titles under one alphabetical arrangement to about 40,000. Thus the work is thoroughly Americanized, and the Library of Universal Knowledge becomes at once the latest and most complete Encyclopedia in the field, at a mere fraction of the cost of any similar work which has preceded it.

For The

Price

of the 15 volumes, complete, in extra cloth binding, $15.00. In half Russia, sprinkled edges, $20.00. In half Russia, gilt top, $22.50. In full library sheep, marbled edges, $25.00.

The superlative value and importance of this great Encyclopædia lies especially in the fact that it is brought within the reach of every one who aspires after knowledge and culture. It is *really* a library of universal knowledge. It brings a liberal education easily within the reach even of every plowboy of the country and apprentice boy of the city. Every farmer and every mechanic in the land owes it to himself and to his children that such a Cyclopædia shall henceforward form a part of the outfit of his home. To the professional man, and every person of intelligence in every walk of life, a Cyclopædia is *a necessity*.

Revolution

Of course the old and wealthy publishers who have grown rich (it is said that the Appletons have made a profit of nearly two million dollars on their Cyclopædia) from the sale of their high-priced publications are not pleased that their monopolies are broken and their power overthrown. Of course the book agents and booksellers who have been used to getting from 40 to 60 per cent. commission for selling these high-priced books are not so well pleased to sell the Library of Universal Knowledge on 15 per cent. commission, though those who are not short-sighted discover that their own interests, after all, are identical with the interests of *the people*, and their real profits, in the end, are increased, by the immense sales which result from meeting the people's wants. The majority of booksellers, however, are better pleased to *slander* than to *sell* this and our numerous other standard and incomparably low-priced publications. But the Literary Revolution has always looked to *the people*, in whose interest it is, for its patronage, and it has never looked in vain, as our more than one million volumes printed last year (this year being increased to probably more than two millions) abundantly prove. You can order the Cyclopedias directly from us, and by uniting with your neighbors and friends you can secure club rates as follows:

$10,000 Reward

To Club Agents.

A discount of 10 per cent. will be allowed to any one ordering at one time three or more sets of the Cyclopedia; and a discount of 15 per cent. will be allowed to any one ordering five or more sets at one time.

As a special inducement to our friends and patrons to go to work *promptly* and *vigorously*, each doing what he can for the dissemination of universal knowledge, we propose to distribute $10,000 in special premiums as follows, in addition to the regular discount to clubs:

$5,000 Reward to be distributed equally among the first 500 club agents who send us clubs of not less than five subscribers, after June 15th and before September 1st.

$5,000 Reward In addition to the first $5,000 to be distributed among the 500 club agents who, during the same time, send to us the *largest number of subscribers*, not less than twenty in number the amount to be distributed proportionately to the whole number of subscribers which each of the 500 club agents may send us.

The names of the subscribers must in every case be forwarded to us. The first $5,000 named will be distributed as specified as rapidly as the orders are received, and the remaining $5,000 will be distributed promptly on Sept. 1st. The names of the persons receiving these rewards will be printed, with the amounts received by each, and the list sent to all the club agents entering into competition for them. Subscribers must be *actual purchasers for individual use*, to entitle the club agent to the rewards under this offer, and not booksellers or agents who buy to sell again.

Persons desiring to raise clubs may send to us at once for sample volumes, if they desire, in the various styles of binding, paying us 75 cents for the volume in cloth, $1.00 for the volume in half Russia, sprinkled edges, and $1.25 for the volume in library sheep. Orders for the full sets will be filled by us with the utmost promptness, within our ability to manufacture, beginning not later than July 15th, orders being filled in the order of their receipt by us.

Specimen pages of the "Library of Universal Knowledge" will be sent free upon request. Descriptive catalogues of our large list of standard publications, with terms to clubs, and illustrated pamphlet describing book making and type setting by steam, will be sent upon application. Remit by bank draft, money order, registered letter, or by express. Fractions of $1.00 may be sent in postage stamps.

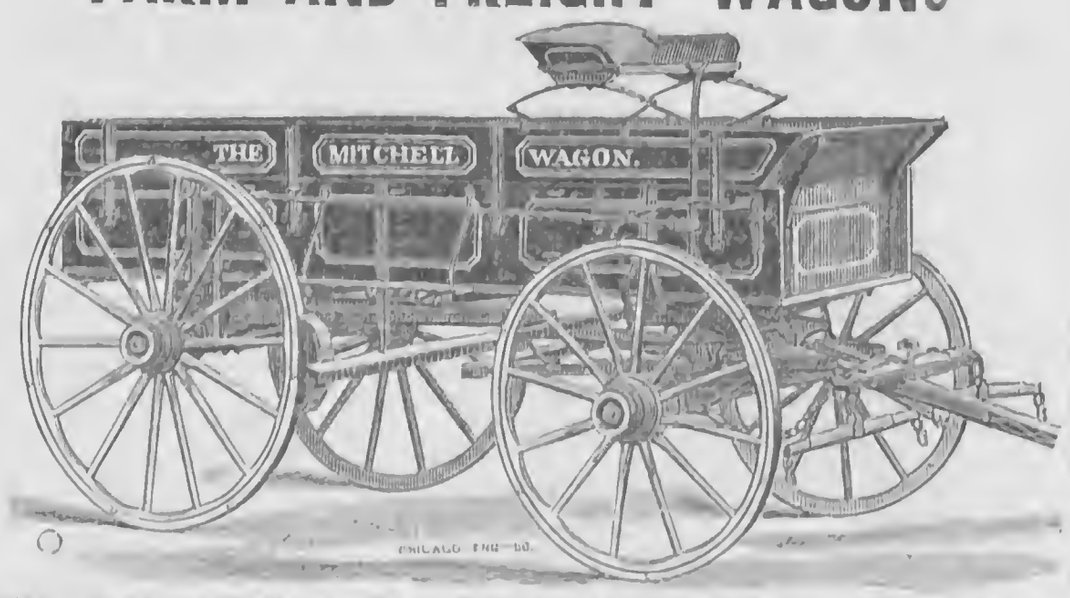
MANUFACTURERS OF

FARM AND FREIGHT WAGONS



Platform Spring Wagons, Three Spring Wagons, Four Spring Wagons Open and Top Buggies, Phætons, Sewing Machine Wagons, Buckboards.

The MITCHELL WAGON is Monarch of the Road, only the very best stock used in its construction and made by the best wagon mechanics in the world. The Spring Wagon and Buggy Department is entirely separate from the Farm Wagon shops. And for the manufacture of this class of work we have facilities unsurpassed. Send for Catalogue and Illustrated Price List.

MITCHELL, LEWIS & CO., Racine, Wis

The request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

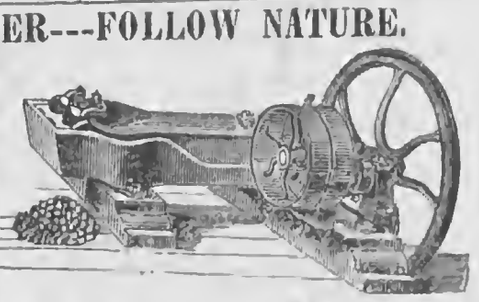
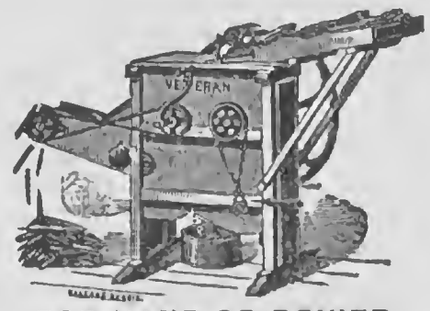
CHEAPEST AND BEST FERTILIZER---FOLLOW NATURE.



Which USES GROUND RAW LIMESTONE in MAKING THE SOIL. There were no Lime Kilns around burning lime when the good **Limestone Farming lands** were originally made. Every Farmer can prepare his own Fertilizer with an **ordinary Horse Power** by using **FORSTER'S COMBINED CRUSHER & PULVERIZER,** which takes a lump of Limestone three to five inches square, and Crushes and Pulverizes it in **one operation,** same as Burr's. Farmers use the Ground Raw Limestone, and drill and sow it just as it comes from the machine. W. W. Reed, of Erie, has tried it 6 years, and says it shows a profit over Bone Dust of $1.26 per acre; over Phosphate of $4.28 per acre; over Guano of $9 70 per acre; over Salt of $5.50 per acre, **and that it will last twice as long.**"—John G. Bear, of Montgomery, Lycoming Co., says: "I believe it to be the cheapest and best Fertilizer in this country. *It is worth three times as much as Burnt Lime, and with this machine does not cost half as much as Burnt Lime to make.*"—H. C. Falls, New Castle, Pa., says: "I used the Ground Limestone last year with great satisfaction as to results, and cannot too strongly recommend it for farm and garden purposes Where I dropped my corn on top of it, the corn came up first, and was strong and thrifty—the Limestone drawing the moisture to the roots. Used in place of Paris-green on Potatoes, it kept the Bugs away and made the plants thrifty and strong; being washed into the ground, it benefited the Potatoes in an astonishing manner. Address only **TOTTEN & CO., Pittsburgh, Pa.** ONLY MAKERS.

Veteran Corn Sheller



FOR HAND OR POWER.

Just the thing for Mill, Farm and Plantation.

Power and Hand Corn Shellers of all sizes and to suit all wants.

Floricultural.

THE JAPAN ROSE—ROSA RUGOSA.

SAMUEL PARSONS, JR.

The interest in the mixed border that contains a general collection of hardy flowering plants is becoming a distinct feature of the horticultural taste of the present day. The abounding, if not superabounding, fancy for bedding plants—coleuses, centaurias and the like—is, comparatively speaking, already checked somewhat, and employment is given more and more to a general collection or border of hardy herbaceous plants, wild flowers, blooming first one and then the other throughout the season. I believe far more of the numerous beautiful varieties of bedding plants will be used in the future than in the past, but bedding plants in a more advanced condition of horticultural taste, will not be used so exclusively as is often the case at the present time. A more discriminating taste will serve to have more or less of all the different classes of plants suitable for the lawn.

One of the most interesting plants for the mixed border is the rose, and among the kinds that succeed best—for roses are, as every one knows, much exposed to mildew, rose bugs, etc.—I want to call attention to the comparatively new Japan rose, Rosa rugosa. The first feature of this plant that strikes us in June is the appearance of its flowers. They are single, of a lovely rosy-pink color, and in one variety even white, and not numerous. It is the single-flowering quality, however, that strikes us as most peculiar. Accustomed, as we are, to innumerable varieties of roses, hybridized into every conceivable form and combination of petals, it is refreshing to happen once more on a single-flowering species that resembles the lovely wild roses that we pluck by the wayside. It is a question whether many would not confess, if they were disposed to be frank, that they really preferred these single flowers generally to the double ones. Nor are the singleness and color of the flower of the Rosa rugosa its only charming features. The shape and set of its petals and charming yellow stamens, imbedded in bright, healthy foliage, are equally attractive. But we are too much inclined to dwell exclusively on the charms of the flower of a plant that is also attractive in other ways. And herein lies one special value of Rosa rugosa—while it is essentially a flowering plant, with all the beauties of a rose flower developed in a high degree, it is also at the same time a charming shrub by right of its foliage. The leaves, more rounded and serrated than those of other roses, and of a dark, rich, healthy green, are never, to my knowledge, dimmed with mildew or blight of any kind, or injured by insects. These leaves are close-set and vigorous, and the general habit of the plant is strong and rugged in a striking degree. There are altogether a richness of hue and an evidently hardy, enduring nature that make it a plant of the very first rank for the mixed border or general shrub groups, or even for occupying isolated single positions. It is, to all intents and purposes, a new plant, and seldom found on any lawn, although it has existed in rare collections nearly 40 years. Lately, however, it has been gradually emerging from its obscurity and obtaining the recognition it has so long deserved.

[This rose, as will be remembered, has been of late referred to several times in these columns. Our illustration is re-engraved from the London Garden or Gardeners' Chronicle—we are in doubt which.—Eds.]

CHINESE WISTARIA.

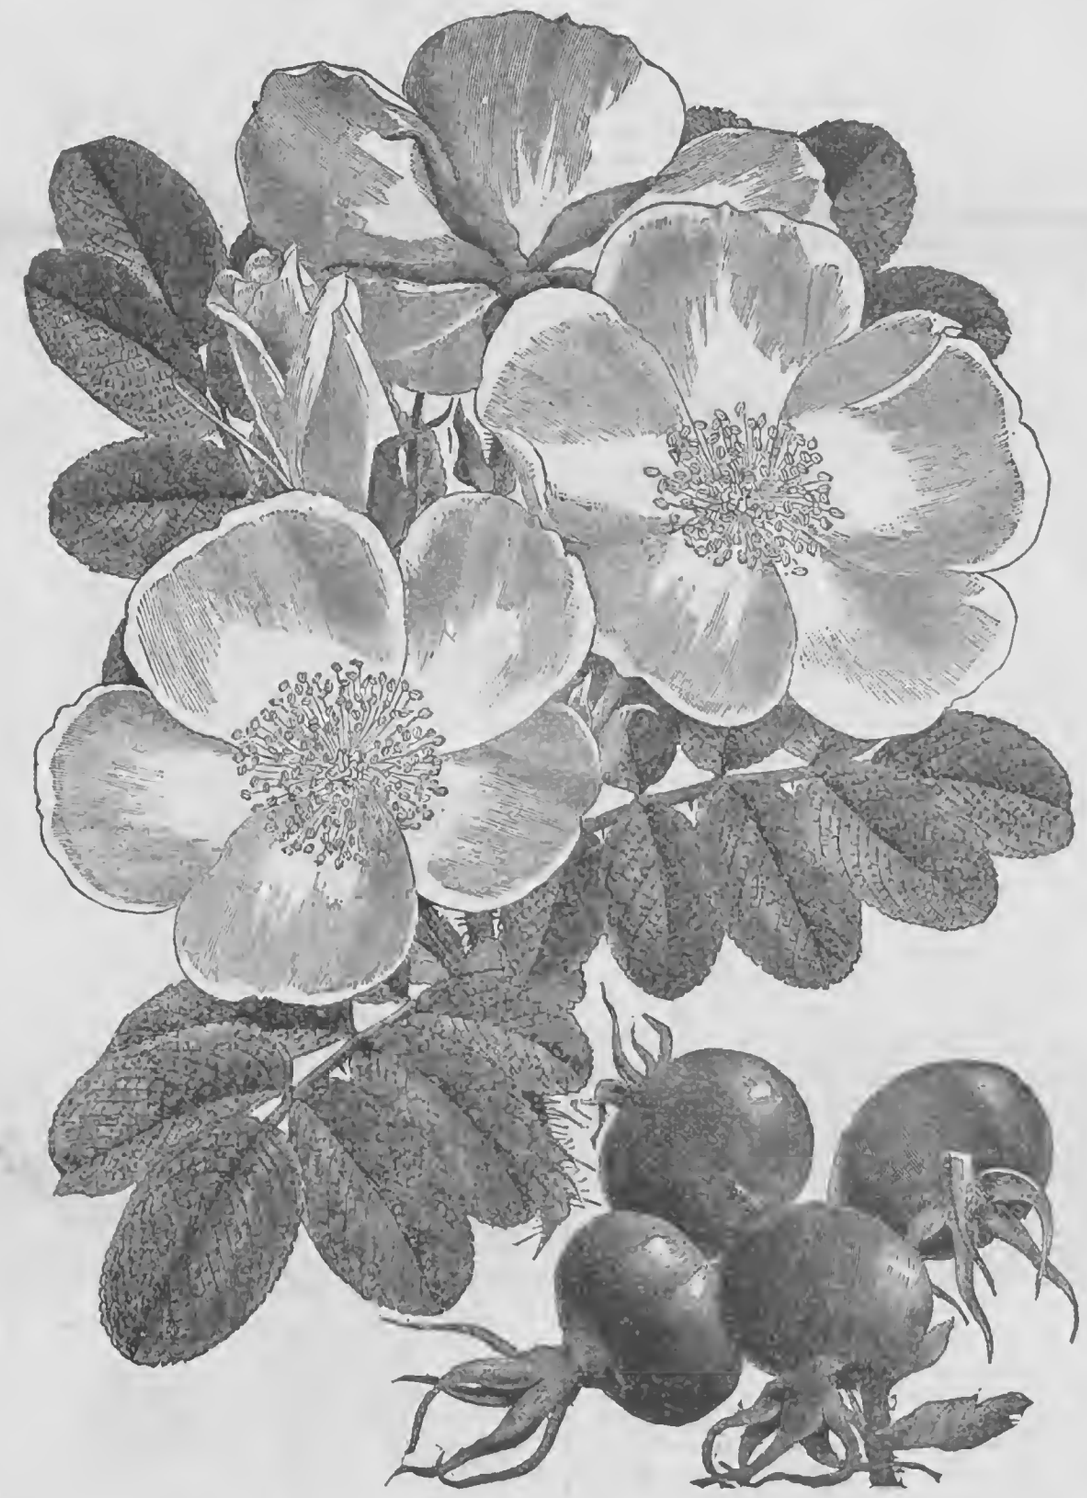
Hardiness a Relative Term.

PROFESSOR J. L. BUDD.

In the notes from the Rural Grounds I have just noticed the statement that the standard specimen of Chinese Wistaria is killed to the ground. In our trying climate I have grown it in nursery rows and on trellis for a number of years and have not known it seriously injured. During the past month I have noticed several fine, strong plants on trellis, in the central portion of Iowa, on which scarcely a terminal branch was injured during our past terrible Winter. On one vine, on the grounds of Capt. C. L. Watrous, of Des Moines, I noticed a number of very large and well filled pods yet clinging to the vine in June. I mention this to give an opportunity for saying that the term *hardy* may have a varied meaning. The hardiness of a plant depends often on its habit of determinate growth and the perfect ripening, in Autumn, of its wood cells. Plants native to the hot, dry portions of northern Europe and Asia may thrive perfectly in the hot, dry Summer air of Iowa, and the advent of severe frosts in Autumn finds them prepared for zero weather. On the other hand, in the moister and cooler air of New York or Michigan the leaves of such plants may less perfectly do their work of storing the cell structure, causing them to be ranked as half-hardy or even tender.

I had an opportunity to take lessons in this direction last week in Michigan. Around Lansing, and on the grounds of the Michigan Agricultural College, I was surprised to find such Chinese plants as Diervilla Japonica, Forysthia, Spiræa prunifolia, Spiræa callosa, Hydrangea paniculata, Lonicera confusa, Aralia cordata, and Prunus triloba, far more seriously injured by the past severe Winter than in Central Iowa. On the contrary, plants indigenous to moister climates, such as cotoneaster, cytisus, hibiscus, and apple, pear, plum and cherry trees from the south of Europe, endured the Winter far better in Michigan than on our prairies.

Ag'l College, Ames, Iowa.



ROSA RUGOSA AND FRUIT.—Fig. 353.

Horticultural.

SOME OF THE NEWER STRAWBERRIES IN THE WEST.

PRES. T. T. LYON.

This fruit has, this season, ripened here somewhat later than usual. The crop has not been as large nor the fruit as perfect as is commonly the case. The markets, consequently, have not been so overloaded as to seriously affect prices. Hence growers of this fruit are jubilant.

Crystal City was our first ripe berry, the first specimens having been picked on June 6. It is hardly likely to take a high position, except for earliness.

Metcalf ripened with the foregoing; but it has only its earliness to recommend it, while it is too small and unproductive, as compared with the foregoing.

Duncan is yet the best, with me, of very early strawberries. Its season may be put with those before named, or a day or two later. The plant, however, is so vigorous and regularly productive, even under unfavorable circumstances, that I esteem it decidedly the most valuable very early berry of my acquaintance. To this I may add that the firmness, large size and high quality of the fruit add greatly to its value, and may even render it desirable to lead the market as the opening variety.

Shirts commenced to ripen about June 14, and maintained its character as productive and a strong grower. The fruit also is large, dark-crimson or scarlet, and of fine quality—too soft for remote marketing. Much to my surprise, both this and Monarch of the West growing in adjacent rows under the same conditions, although they withstood the last Summer's sun satisfactorily, have suffered more severely from the past Winter than any other of the older standard varieties growing near them, among which I may name Sharpless, Seneca Chief, Wilson, Charles Downing, Duncan and Cumberland Triumph.

Crescent has shown its usual ability to produce both plants and fruit; but it must certainly, with me this season, yield the palm of productiveness to

Champion (Windsor Chief), which has this year exceeded itself.

Sharpless has shown its usual vigor, coming through the Winter unscathed, and producing a fair crop of fruit, mostly of fine, large size; but I regret to say that they were generally hard at the tips, apparently the result of a slight drought just before the season of ripening. Other varieties in adjacent rows were little, if at all, affected from this cause.

Marvin is said not to withstand the sun at the East. With us, however, this has not been a difficulty, although it cannot be said to be as strong as Sharpless. It is only a moderate producer of plants. It has suffered from the severity of the past Winter, though to a less degree than Shirts and Monarch of the West, in adjacent rows. Its first matured specimens were gathered this season from the 20th to 23d of June, but specimens may now (July 16) be found upon the plants in various stages of unripeness. Our exemption from Summer injury may be due to a lacustrine climate and a consequent exemption from extremes of heat. Be that as it may, my plants, though on rather light soil, are as fresh as could be desired under the excessive heat and bright sun of the past month. The past Winter with us has been decidedly exceptional, and, whatever Eastern planters may do, we at the lake shore may venture to plant the Marvin extensively for the market.

Woodruff's No. 1 is a berry originating at Ann Arbor, Michigan, and has now fruited with me two years. I am not confident that it will be found very desirable, although it is productive and of good quality. The fruit is long, conical and pointed, and has the rare peculiarity among long berries of ripening fully and even first at the tip. It ripened this season on June 18.

Woodruff's No. 2 from the same source, is said to be a cross of Jucunda upon Agriculturist. The fruit is of fine size and quality, in form truncate-conical to oblong-ovate; considerably elongated—a peculiar form; and, like the foregoing, it ripens first at the tips.

Red Jacket, President Lincoln, New Dominion, and a few others have this year shown much promise; but, considering the peculiarity of the season I omit further notice of them till they can be observed under less exceptional circumstances.

Cumberland Triumph has done wonderfully well, and has established itself yet more firmly in my confidence as a highly desirable berry for the table, and a profitable one for the good cultivator and for a near market.

MINER'S GREAT PROLIFIC has developed hardiness, size, productiveness and vigor enough to commend it for general market planting, and it only lacks hardiness and firmness to commend it to the first place as a market berry.

So. Haven, Mich.

STRAWBERRIES—THE BIDWELL.

THE past season has been a very favorable one for the growth of strawberries and the yield was exceptionally large, affording an excellent opportunity for comparing the productiveness of the different varieties as well as deciding the question of firmness. Although the continued wet weather was detrimental to the development of aroma in some of the higher flavored varities, it was interesting to observe the varying capabilities of those most generally grown for market, and experimenters may begin to draw the line closer, so as to exclude a great many kinds which have neither size, flavor nor habits of bearing to commend them over those that are old and well tried. In fact, when we consider the wonderful strides in advance marked by the Bidwell, Longfellow, Oliver Goldsmith, Shirts and Seneca Queen, it seems like folly for men who are engaged in the business of raising and disseminating plants to sound the praise of inferior kinds, and herald every new-comer without first thoroughly testing its merits alongside of its peers, in conditions wholly unpampered by tender care and treatment, leaving to their inherent qualities and natural vigor the right to rescue them from oblivion. [Surely, that is what the RURAL is doing. EDS.] Failing then to establish a superiority in some important particular, no berry however much of a pet, should be allowed to swell the already impracticable list and add to the perplexity of buyers.

It was under this most natural test that the Bidwell, in competition with over a hundred others, came to the front, and stands preeminently in the first rank to-day as a market and garden berry, exceeding, with improved cultivation, the most liberal expectations of its friends. I have seen it in all stages of growth till the close of its present fruiting—July 2d—which extended over an entire month, and the last two quarts were as handsome, large-sized berries, ripened as evenly to the tips, as any picked during the 31 days preceding; and, although familiar with its fine table qualities, I was surprised at the briskness and delicacy of flavor which characterized it to the last.

Can as much be said of any other strawberry? The foliage, a healthy, dark green, stands up well under all conditions. The plants form immense, compact stools; and the enormous quantity of large, regular-shaped, bright-looking berries which they ripen perfectly, astonishes every one who has seen them.

In this connection I would suggest that there are often too many kinds grown for profit. With one or more of the above-mentioned sorts as a staple crop, the Duchess for early and Hervey Davis or Memphis for late, there would be a succession of fruit, which, in this State, could not be equaled.

And, buyers, beware of a multiplicity of names. I can call to mind a number of instances where, undoubtedly, two or three well known names sell the same stock of plants. And above all things, be careful of whom you buy. A nurseryman who, after working for years and spending large sums of money to secure a certain stock, and finding it inferior after all, has the moral courage to tell you, "It has not done well with me, I would not recommend it," thus leaving thousands of worthless, profitless plants on his hands, may be trusted implicitly when he praises anything, as it is fair to presume he does so for its intrinsic value. W. C. S.

RURALISMS

WITH me the first raspberry to ripen was the Doolittle Black Cap, and next the Caroline, with perhaps a day's difference between them; and almost at the same time the New Rochelle. These three kinds, therefore, may be placed as very early. The next to ripen was the Cuthbert, a single ripe berry having been picked on July 9th, a fair mess having been picked from the Doolittle and the Caroline on the 4th. The Montclair is still later than the Cuthbert, no ripe fruit having yet (July 9th) been picked. The different kinds are all in near proximity to each other. Ripening in this way, the season is quite prolonged. The productiveness of the Caroline is so remarkable that I cannot help alluding to it again; and the New Rochelle is but little behind it. If anybody supposes that these plants are growing in a rich soil, he is laboring under a mistake.

WHY can we not have more articles like those from Mr. Parnell, Mr. Augur, "A. P.," and "Notes from the Rural Grounds?" They have a special value for all of us after a Winter like the last. A. P.'s notes on his experiments with the RURAL seeds, etc., are interesting, and I should be glad to see more like them. After taking as much labor and pains as the editor does to give seeds and plants to his subscribers, it must be a pleasure to him to know that pains are taken to grow them. [Horticola should look over the 'Everywhere" Department more carefully. We have only feared that we were giving too much space to the reports with which our readers are constantly favoring us, and which are always welcome.—EDS.] I fear, however, that the little boys and girls over in the juvenile department are far ahead of the big boys and girls in this respect, which, however, speaks well for the future.

How much wrangling, to say nothing of ill-feeling, might be prevented by fair and manly statements like those of Mr. Waldo F. Brown. He "hopes the Professor will accept his apology," and I think there can be no doubt about that. How much better this than to know you are wrong, and "stick to it?"

I HAVE been thinking that the winter-killing of the Japanese maples may have been owing in some measure to the fact that they had been grown in pots till the roots had become matted into a mass almost as hard as a stone, with very little earth left to sustain them, their chief dependence being upon the daily waterings. I know that such balls of roots are being constantly moved in the Winter, and that plants otherwise hardy are in this way not unfrequently winter-killed before new roots have been thrown out from the old ball, and this, under the circumstances, is a very slow process. It is often years before they recover from this stunting system. This cramping of the roots, moreover, weakens the constitution of the hardiest plant, familiar examples of which might be named; but I alluded to the subject chiefly for the purpose of eliciting an expression of opinion or experience from the readers of the RURAL. The subject is sufficiently interesting.

THIS, so far, has been an excellent season for testing artificial or commercial fertilizers. It has been my experience that they are of very little value without a fair supply of rain, and this from the very nature of their composition. We have had, thus far, an abundance of rain, and I shall be greatly disappointed if the readers of the RURAL do not send in, at the proper time, carefully-prepared statements of their experience. We shall have, of course, the results at the Rural Farm and at the experimental stations, and these will be valuable; but the stations are altogether too few and wide apart to satisfy the expectations of the general farming community. Perhaps the editor already has his attention fixed on this important subject.

I AM a little puzzled to know why that excellent early pea, the Alpha, should be so uncommonly sweet this season. This has been the case, not only with me, but wherever I have seen it or heard it spoken of. The moist weather has been unusually favorable to the pea, and it may be that this, in connection with the intense heat when the sun did come out, has had the effect of developing the saccharine principle in an unusual degree. Perhaps other kinds may be sweeter than usual, though I have not yet noticed it. HORTICOLA.

NOTES FROM THE RURAL GROUNDS.

Early Sunrise Pea.

MANY new peas of extraordinary merits are yearly brought out in England. The most notable of late years have been the Telephone and Telegraph, which, however, prove to be the same. Generally speaking, these pea novelties when cultivated here lose their distinctive character, and of all the English varieties introduced during many years the Champion of England still holds the first place. The Telephone, however, during three years has held its own well, and, as we have stated, proves to be of unusual excellence, while the vines are strong, free from mildew, and the peas large, tender and sweet. Last year a new pea was offered in England and was advertised under the name of DAY'S EARLY SUNRISE. We give the announcement as found in the catalogue of Daniels' Brothers, of Norwich:—

EARLY SUNRISE (Day) (see illustration). Large-seeded, first early, dwarf, white, wrinkled Marrow, of strong and robust habit. It is very hardy and extremely prolific (the haulm being covered with large well-filled pods), while, as the peas are large and very sweet when cooked, it is very desirable either as a market variety or for gentlemen's gardeners' use. It is especially free from mildew, and has proved itself extremely useful for late sowing. Per half-pint, 1s. 3d.; pint, 2s.

MR. JOSEPH FORD,

Gardener to H. R. H. the Duke of Edinburgh, says:—"It is of splendid quality, very robust, and as early as Ringleader. A large wrinkled Marrow as early as this requires little recommendation, and is what all gardeners have long wanted."

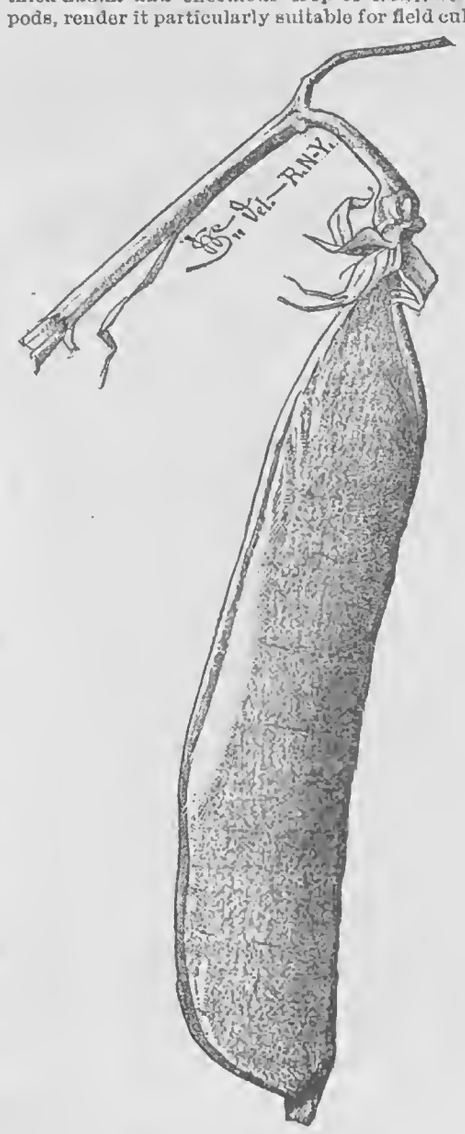
MR. T. HOSSACK.

Gardener to the Marquis of Conyngham, also tried it, and writes of it:—

"Your Early Sunrise Pea is a strong grower and great bearer. It is of splendid quality, yet comes in with our very earliest sorts. Being a Marrow, it will be a great acquisition to our early crops, while it is also very useful for late sowing."

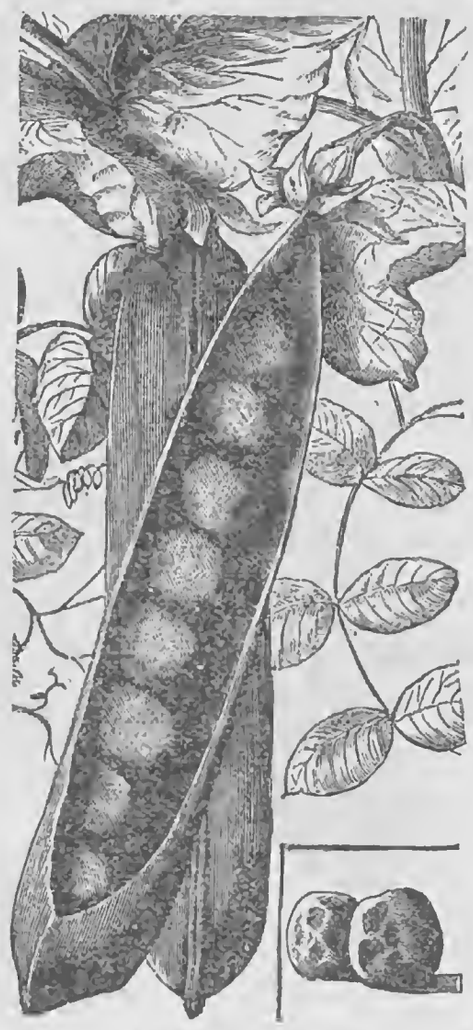
A large market grower, Mr. Joseph Collard, of Hardacre, having, by desire, tried it, reports:—

"It surpasses anything I have ever seen or grown as a first early or general market variety. The short, thick haulm and enormous crop of large, well-filled pods, render it particularly suitable for field culture."



DAY'S EARLY SUNRISE—FROM LIFE—FIG. 354.

One-twentieth of an acre of this pea was sown May 10. They were ready to pick July 10. It will be seen that in this climate it is not a very early pea, but should take an intermediate place between the early and the late. The leaves are rather small, though the stems are strong, growing about three and a-half feet high. The pods, as shown in our engraving, are of medium size, containing from four to five peas of good size, which are of fair quality. Thus far there seems to be nothing remarkable about the Early Sunrise. But we have to add that it is as prolific as any kind of



DAY'S EARLY SUNRISE—FROM ENGLISH CATALOGUE FIG. 355.

pea we have ever raised. The single pea (Fig. 354) is an average of our crop; Fig. 355 is reengraved from the catalogue above referred to.

GARDEN NOTES.

THE ALPHA POTATO I am very much pleased with. I have grown it for the first time this season, and I can cheerfully recommend it to all who desire an excellent early potato. I obtained a bushel this Spring and planted them on April 14, using Forrester's Potato Fertilizer, and the crop is all that could be desired. The vines are maturing now while those of the Early Rose, grown alongside, are quite green. On being cooked, the flavor is found to be excellent, with a dry, white flesh. The tubers are of medium size, smooth and white, with a trace of red near the eyes. The stalks or vines average 14 to 16 inches in hight. As a variety for garden culture where early potatoes are desired this kind is without an equal [Did they yield well?—EDS.]

ROSA RUGOSA, the Ramanas Rose of Japan, is, when well grown, a very desirable addition to our ornamental plants for lawn decoration. Grown in a deep, rich soil, with an annual dressing of well rotted manure, it will soon attain a hight of five or six feet, with large terminal clusters of rosy crimson flowers which are about three inches in diameter. They are produced very abundantly in June and also at intervals throughout the Summer months; being succeeded by large red berries which are a great addition to the ornamental character of the plant. This rose is best grown as a standard with a single stem, 10 or 12 inches in hight, before it is permitted to branch. Do not prune it severely, but pinch back the young shoots occasionally during the season of growth, so as to keep the plant in shape. See illustration, page 497.

COBÆA SCANDENS is one of the most beautiful and useful of our climbing annuals. Strong plants set out early in May in good, rich soil, often grow 30 to 40 feet in a single season, besides the branches which are freely produced. If the plants are carefully taken up and potted just before frost, they will be found to be very useful for the decoration of the greenhouse as well as the window garden.

Queen's Co., L. I. CHAS. E. PARNELL.

Strawberries.

I had a pleasant visit to a neighbor's farm lately. He has fruited 22 varieties of strawberries this season and nearly all of them seem to do well under his system of cultivation. I picked some of the largest and finest-flavored berries I have ever seen from his bed of Sharpless. He regards the Col. Cheny as one of the finest berries he raises. The Green Prolific is smaller, of fair quality, but it is too soft for market. The Glendale, contrary to his expectations, proved no later than the Kentucky and resembles this variety in many respects.

Addison Co., Vt. GARDENER.

Field Crops.

CORN CULTIVATION.

Reasons for Various Methods.

S. RUFUS MASON.

THE RURAL for July 2 has "Notes from the Rural Farm" on page 435, in which are several important queries and conclusions from home practice. I offer the following remarks:

Hilling up corn is necessary in heavy, solid clay soils, as the only mode of letting the sun's heat down into the cold soil around the corn roots. On such soil flat cultivation would not answer. Root-pruning is, to a certain extent, a misnomer; few, if any, roots are cut off, but the frequent close cultivation checks and prevents the full development of surface roots and stimulates the downward ones, acting upon the plant exactly as if the upper roots were really cut off. The engraving, No. 317, does not represent this operation at any stage. Root-pruning begins at the first cultivation, never exposes any roots to the air, is never performed when the ears are formed, as all cultivation ceases long before then. Hilling does not support the plant, and I never heard any one say he thought so. High winds (and we have ample experience with them here in Nebraska) never prostrates corn till the ears are so large as to make the plant top-heavy, and so by their leverage they help the wind to tear out the roots from the soil softened by the accompanying rain. Flat culture is suitable to sandy land, as that is warmer than clay; it is also necessary on hill-sides as not presenting gullies inviting heavy rains to wash.

Check-row culture is required on weedy land, as it enables the cultivator to reach all weeds by cross work. Drill-rowing is only advantageous on very clean land, kept so by repeated harrowings before the corn is up and till it is six inches high, and where the farmer can attend to it constantly till July 4th. It is not necessary to make drills further apart than checks, but they must run North and South. Root-pruning will not answer in shallow soils with rocky or impenetrable subsoils; but here, where our soil is from two and one-half to four feet deep, it is a benefit. When we have a hot, moist May and June, if we do not root-prune, the surface roots are scorched by the fervid July sun, and the leaves curl, much injuring the crop.

Fig. 318 shows the roots only as they grow here in a wet, cold Spring, when they rise to

the surface in search of warmth, and possibly as corn grows on thin soils in the East. Corn has as much natural instinct as an animal, and accommodates itself to the season, if its changes are not too sudden, and to almost any sensible mode of cultivation, if steadily pursued; but the work of a fickle-minded farmer will demoralize a corn crop more quickly than any other crop I know of. "The great crops of Indian corn produced by plow cultivation and hilling up" were no doubt grown on the cold, heavy soils of the Illinois bottoms, and if flat culture had been employed there would have been no corn. "The narrow belt" in drill corn, on which the plants grow, must be kept clean by horse culture; our corn cultivators do that nicely. We never use the hand hoe in any field crop. There is a wonderful amount of good, solid schooling to be had at the tail of a corn cultivator in a 60-acre corn patch. If economy is a valuable item in life, there is no better place to learn and practice it; it doesn't pay to be extravagant while growing corn to sell at 10 cents per bushel. Corn is an extremely succulent plant, a too great profusion of roots grows a large, delicate stalk, very watery, growing late, setting its ears late, getting caught by frost and yielding a small crop of soft nubbins. "Root-pruning" obviates all this, if practiced at the right time with great judgment. We "corn-crackers" don't believe that much practical or useful knowledge can be obtained from the limited area of a one-half-acre corn field.

Dodge Co., Neb.

TOBACCO NOTES.

TOBACCO, being by nature a tropical plant, requires hot weather to produce its best development. When grown in the Northern States, therefore, it is important that the growth should be stimulated as much as possible in its earlier stages, in order that it may accomplish its development during the hot weather of midsummer.

AN experienced tobacco farmer stated, at a recent meeting of the Chemung County Tobacco Club, that he was told, when he first commenced to grow the weed, that "he must draw all the soil from between the rows, around the plants, at the second hoeing." He followed the plan for a number of years, but finally tried the effects of level culture, and, to his surprise, he found the plants not hilled grew fully as well as those hilled up at great cost for labor. Of late years he has done away with the "hilling-up" process.

A TOBACCO RAISER ought always to bear in mind that there is quite as much in the quality of tobacco as in the quantity. A small, poor plant will usually be destitute of many, if not of all, desirable qualities, and must bring a correspondingly small price, which sometimes is below the cost of production. A large, healthy plant, grown with an abundance of suitable food, will generally produce leaf of desirable qualities that sells readily at a price which will be remunerative to the grower.

A GOOD crop of tobacco cannot be grown without thorough cultivation. Clean and deep culture is essential to success. The roots of the tobacco plant are naturally very fibrous, requiring a loose, mellow soil for their natural growth; therefore it is clearly to be seen how important it is to keep the soil in a loose, mellow condition with hoe and cultivator. A common mistake is in not cultivating deep enough. The shares of the cultivator should be run deep into the soil. Thus not only the surface proper is pulverized, but the soil to a considerable depth, which allows the rootlets to spread out and penetrate a greater area of soil than could otherwise be possible.

I HAVE the past season used a small quantity of the Maryland "Tobacco Food"—a special fertilizer for tobacco. Two hundred pounds were first applied upon the first half-acre prepared for the plants. It was scattered along the rows evenly, after which it was covered by the ridges. I am now able to see a decided gain in the growth of the portion of the piece where the first lot was applied. The first setting consisted of about an acre, set May 27, about half of which was treated as above stated with the fertilizer. The rows thus treated show a marked difference in size of plants, in favor of its use. Another sack of 200 pounds was applied to another portion of the field, but later, so that its effects are not as yet visible. I have also applied the Swift-Sure Superphosphate and some hen manure to portions of the field, the effects of which I will speak of in due time.

TOBACCO does not deteriorate in quality when the same soil is used for many successive years, if enough manure is annually applied. Mr. John Brand, a noted tobacco grower of Chemung County, has planted a field with tobacco for 12 consecutive years, each succeeding crop proving to be of better quality than the previous one. He manures with stable manure, applying it at the rate of 15 large two-horse loads to the acre each year. The soil, however, in this field consists of alluvial, sandy loam. With clay soil the case might be different. For the benefit of the farm it is usually advisable to change the tobacco field every three or four years and substitute a rotation, ending with a seeding with clover. Thus, the various fields of the farm pass through the same thorough cultivation, which destroys all noxious weeds and reduces the soil to the finest possible tilth.

G. G., JR.

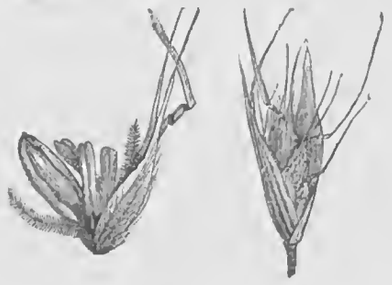
Chemung Co., N. Y.

TRITICUM REPENS,

Couch, Quitch, Scutch, Quick, Quack or Rye-Grass.

I NOTICED in a late RURAL an application for seed for Quack Grass! As I have just had a sweating job digging out "Quack," along the garden fence, as it was encroaching rather too freely into the vegetable department, I again read the article asking for seed of the pest. I was amused that any person in a sane state of mind, should want "two sacks or bags of the seed, and offer to pay therefor the price of timothy seed!" I don't believe that any respectable seed dealer would allow it to be brought to his warehouse, if it should be offered to him *gratis*. I doubt very much if seed of this "pest," has ever been collected or offered for sale, unless some scamp would offer it as some new forage plant far superior to the "Rural Branching Sorghum," as it may be cut half a dozen times in a season and yet only grow the more vigorously, *and last forever and a day*. I would much prefer to have patches of Canada Thistles in my fields as these I can easily destroy. All I would have to do would be, when the fields were in pasture, to sow some salt over them and the cattle would soon make an end of them.

Many years ago, receiving some trees from Flushing, Long Island, I saw a strange-looking grass come up from the roots of a Pyracantha shrub. There was at that time in the meadow a hill-side on which no grass would grow to make a sod. Thinking this vigorous-growing grass might take root, I foolishly took up some roots and transplanted them on this barren spot, to keep the ground from washing. Of course I did not then know what "Quack" was; but I have found out all about it since to my cost. On this barren spot it flourished and in a few years spread round more than was "bargained for." It got into the orchard, meadows, and along fence rows and in clearing ditches in the meadow it was dragged to low places, etc.



FLOWER.—FIG. 357.

If your correspondent really desires to have this pest on his ground, his best plan would be to go where it is growing, dig up some of the roots, run them through a straw-cutter—as Mr. Meehan, Editor of Gardeners' Monthly, recommends for propagating the blackberry—sow the cut roots on freshly plowed ground, harrow the ground afterwards, and I'll warrant he will get enough plants to satisfy him, and he will have enough to last him a life-time, I consider this "Quack" the worst pest that was ever created.

T. B. G.

Columbia, Pa.

[We are much obliged for the opinions and experiences of our readers. We do not agree with our friend as to this grass—as we shall one day attempt to show.—Eds.]

COMPRESSED OAT GRASS—DANTHONIA COMPRESSA.—FIG 356

Poa pratensis.

Mr. Hillgard makes a handsome showing for Poa pratensis (Kentucky Blue Grass), and I rejoice to hear that this eminently excellent and beautiful lawn and pasture grass carries its usefulness over so wide an extent of our vast territory, and that it can be so well supplemented in the hot season, in the South, by Bermuda Grass. But why do you call it "blue" when it is so intensely green—the greenest of our grasses? Poa compressa is fitly called blue in comparison with P. pratensis, being but grayly viridescent, and parching on dry, thin soils in hot weather about equally with it, never dying out, however, and supporting grazing animals as long as they can nip off the least bite, green or dried. We call the pratensis "Spear Grass" here (Pa.), probably from the round, erect, cleanly, tapered culm, and the trim lanceolate form of the panicle at its summit. June Grass and Green Sod are other names for it. An enterprising neighbor sent to Kentucky for seed of their famous Blue Grass, and sowed it on carefully-prepared ground. Grass spires shot up quickly, but when they bloomed next season they were precisely the green grass of every road-side and common in the neighborhood. His first conclusion was that the Kentucky seed had all failed, and that native grass appeared in its stead, and he was a good deal exercised in mind over the substitution until he was shown Kentucky Blue Grass and Pennsylvania Blue Grass, as both were on his own ground. The only hurt that Poa pratensis takes here is from shade. It does not flourish out of sunlight. It will even kill itself by a thick mass of second-growth blades left unpastured or uncut too long, in August and later.

W. G. W.

Tyrone, Pa.

Compressed Oat-Grass—Danthonia compressa.

This is not very common in many localities. It grows in dry hills in New England and farther south. As the illustration shows, it is taller than the other species heretofore mentioned. The leaves are fewer and very long and narrow. It forms a good turf and makes a fair pasture. I cannot learn that any one has given this grass a thorough trial, and it may be questioned whether it is worth much notice.

PROF. W. J. BEAL.

THE RURAL BRANCHING SORGHUM.—I sowed a few seeds in a box in March, in the greenhouse, and planted them out after danger of frost was past. Each plant now has a main stem four to five feet high, tasseled out and in full flower. These will ripen seed, no doubt, in good time. There are plenty of sprouts, or suckers, from the roots also.

T. B. G.

Columbia, Pa., July 8

[The dwarfness of the plant is due to its having been started in a box in the greenhouse. If not cut back, the stalks will grow at least nine feet high before blooming.—EDS.]

Farm Topics.

PRESERVATION OF BREWERS' GRAINS.

PROFESSOR F. H. STORER.

SOME cheap and easy method of preserving brewers' grains has long been needed, and striven for; and during the last few years renewed attention has been given to the subject by European inventors. Several plans have been suggested and some of them appear to have found favor in the eyes of competent critics. There are good reasons why these endeavors should be welcomed and encouraged by farmers as well as by the brewers, for the discovery of a really economical and efficient method of preserving this kind of fodder would be a decided gain for agriculture. The amount of brewers' grains actually produced in the world is something enormous, and, as things are now, much of this "waste product" cannot be utilized to the best advantage, during the warm weather of Summer, at least.

Many farmers living at a distance from breweries will naturally derive immediate benefit from the use of the preserved grains as soon as they are to be had; but, more than that, the mere fact of their being procurable would undoubtedly serve as a spur and encouragement to the use of other kinds of concentrated foods. It happens to be a well-known fact, admitted by everybody, that brewers' grains are excellent fodder for many purposes. They are used freely by farmers wherever they can be bought. Indeed, little if anything, can be said against them except their liability to spoil, and the fact that, in the fresh state, as ordinarily sold, they contain more than three quarters of their weight of water. It is true, withal, that the milk of cows fed with grains that have become sour is itself peculiarly liable to turn sour on keeping; hence any process which may serve to keep the grains sweet in hot weather ought to be welcomed both by the producers and the consumers of milk. Furthermore, there can be no doubt in anyone's mind that the merit of the grains must depend upon the nitrogenous constitutents of the barley from which the starchy portion has been well-nigh completely removed by the operations of the brewer. There is consequently good reason to believe that if the dried grains were to be had at a reasonable price they might serve an important educational purpose by familiarizing

many persons with rational systems of foddering.

It is a matter of common observation both that milkmen take very kindly to the use of brewers' grains wherever they have access to them, and that men who have once had practical experience with the use of this kind of food are thereafter much more ready than they were before to employ shorts, and oil-cake, and cotton-seed meal, and the other nitrogenous reinforcements to rough fodder, which so greatly enhance its value. It is not improbable, even, that the use of flesh-meal, and fish-meal for foddering purposes, instead of for manure, might follow as a consequence of the introduction of dried brewers' grains to the American markets. Methods of drying, baking and ensilaging the wet grains have been suggested. Indeed, it was proposed many years ago to dry them in the malting kilns, and an excellent product was actually obtained in this way though at too great a cost for profit. A more recent method is to whirl out as much as possible of the water in a centrifugal machine into which hot air is subsequently admitted so that the remaining moisture may be dried off. The product is then pressed firmly into cakes which are said to serve admirably as fodder. A still newer method, recently patented in Berlin, consists in baking the grains to a sort of bread after they have been worked up to a kind of dough by the addition of other matters appopriate to the purpose. The German patent commissioners are said to have accepted the plan, as being novel and worthy, and a company has been formed for working the process in Germany. The product of the baking is described as a brown, porous, friable substance which smells like new bread and even tastes somewhat like bread. It softens readily in water, and may be fed either mixed with cut-feed or given to the animals as a drink. It is readily eaten by cows and their milk keeps without souring as long as good milk should.

With regard to ensilaging brewers' grains, it has recently been urged that the product keeps best when mixed with an equal volume of chopped straw at the time of packing. In a case described in a recent journal the walls, but not the bottom, of the silo were cemented. The bottom of the trench was simply covered with straw to shield the grains from dirt, and alternative layers of the grains and of chopped straw of equal bulk were thrown in. Each of the layers of grains is forked into, and incorporated with a layer of the cut straw, and the whole is firmly trodden, and covered in, and weighted with, a couple of feet of earth. When thus prepared the grains are said to keep perfectly well. It was remarked that the silos were built in soil that was not completely impermeable, and that in some earlier trials where the floor of the silo was cemented and the mixing with cut straw was less thoroughly done, the grains did not keep so well. It is held to be important anyway to have an abundance of cut straw in the mixture, especially towards the bottom of the pit.

SOUTHERN OHIO NOTES.

How to Make Profit from Raising Grain and Feeding Cattle.

WALDO F. BROWN.

It is in hot, rainless, dewless seasons such as this that good farming tells. Meadows sown on strong land or top-dressed with manure made a fine crop in spite of the drought. So, wheat that was put in early and in good condition, is up to or above the average in spite of an unfavorable Fall, a hard Winter and an intensely dry Spring. The corn that was planted the first ten days of May on well prepared soil that had been thoroughly cultivated, is not as yet seriously injured.

The great curse of our farming here is it "muchness." Grain, grain, grain, without rotation, fields growing ten or fifteen grain crops in succession, and when a hard Winter, a severe drought, rust, or chinch bug comes, the wheat or corn has not vitality enough to resist, and a failure is the result.

It would seem as though many farmers had never calculated where the profit in farming comes from. It certainly is not from average crops. Our statistics extending over a period of about 20 years, show the average of the wheat crop to be about 11 and of the corn 34 bushels per acre, and the farmer must be good at "figgers," who can "cipher out" any profit on such crops. There is a fixed expense in growing a crop, no matter what the yield, and if it will not sell for enough to meet it, the less land we plow the better, for when we seed land in grass or clover, and pasture it, there is so little expense that a much less income from it than from grain gives a profit, and the land, instead of growing poorer, is improving.

I believe I have learned the secret of profit in feeding cattle, and also how to make the most out of pasture land. It is to take advantage of the season of growth, which is late Spring and early Summer. I believe that double the increase of weight in a given time can be made with cattle on pasture at this season, when grass is fresh and sweet, and making a rapid growth, and there are no flies to trouble. Another thing which is in its favor is, that when the stock is to be sold in June the pasture can be stocked twice as heavily as if the same stock must be kept all Summer. With good judgment in buying and selling, there can often be twice as much profit realized in six weeks' pasturing as is usually done in as many months, and it is certainly better for the land than if tramped and pastured till late in the Fall and left bare for Winter.

In order to get this large gain and consequent profit, I think it absolutely necessary that the cattle should be grain-fed for a few weeks before turning to grass. They need not be put on full feed, but must have enough grain so as to begin to improve in condition and show that they are thrifty. March is a favorable month for buying cattle for two reasons: 1st, they are generally cheap from the fact that many farmers find themselves over-stocked and must either buy feed or sell stock; and 2nd, cattle bought at this season and well cared for will not shrink in weight, but begin at once to gain, while if bought from the pasture in the Fall the shrinkage often amounts to 100 pounds or more each. I think there is more demand and a better market for beef at the season of the year when these cattle come into market, than at any other. The start they get from the month or six weeks' feeding brings them in ahead of grass beef, and at a season when the butchers are troubled to find stock enough to supply their wants. My account book shows a profit of $16 a head, on an average, on the cattle I bought in March and marketed in June, and I estimate $12 of this for six weeks pasturing, and as good pasture will carry, for this short time at this growing season, at least one full-grown animal to the acre, this is a fine rent for the land. The cattle I have managed in this way were two-year-old heifers, but I think I should have done better with larger cattle, as they brought a better price. So thoroughly convinced am I of the profit of this method that I shall keep no cattle except my milch cows either in Winter or Summer, but save all my grain and hay for March and April, and either let my pastures stand empty or take in stock to pasture for others after selling off my cattle. I was first led to experiment on this plan by the experience of an Illinois feeder who has been very successful since he adopted this plan. I have been in correspondence with him for three years and have been very much interested in his success. I will, if desired, show what he has done. [Please.—EDS.]

Dairy Husbandry.

THE DAIRY COW.

HENRY STEWART.

Management of a Heifer.

WHEN a calf has reached the age of nine or ten months, she may be introduced to the company of the bull. Some forward calves have been known to be in breeding condition at five months, and have become cows at the age of 14 months. This early breeding is not advisable, and it is therefore well to avoid the company of the bull until the calf is at least nine months old. A dairy cow should be bred at an early age, for the reason among others that it encourages precocity and aptness to milk liberally, and, as a matter of course, lengthens the profitable life of the cow by making an early beginning. When the calf has become pregnant, it is a heifer and upon its treatment until it becomes a cow, which occurs when it drops its calf and begins to milk, depends very much of its future usefulness. There are three important points to consider: the feeding, the discipline and the health of the animal. These three points successfully managed, make up the value of the cow.

The feeding should be such as to maintain a constant, uninterrupted and healthful growth. The course which has been recommended for the calf is right for the heifer, but the quantity of the food may be judiciously increased. As the young animal grows, its own requirements increase in a progressive ratio, and a regular increase of its ration may safely be given. The warning point of danger in excessive feeding is shown when an animal eats its food with reluctance; when its general appearance denotes that it is out of order; its muzzle dry; its dung hard, of a disagreeable odor and dark color; its skin rough and coarse and its demeanor dull and listless. A frisky young animal, with bright eye, moist muzzle, sleek coat, always ready for its food may be considered as doing well, and while it is making a satisfactory growth it is well to let well enough alone. Oats and bran with a little linseed meal furnish the most wholesome food for a heifer, in addition to grass or hay. The Summer food may be pasture, and even in the best pasture, two quarts of oats and bran mixed and a pint of linseed meal will be well paid for in the increased value of the heifer.

A considerable element in the value and usefulness of a cow is the capacity for the digestion and assimilation of food. This is a matter, not of natural ability, but of education and training, and, like all other training, it requires to be secured by slow and gradual steps. If a calf is stinted in food and the capacity of its stomach and digestive organs is economized, it may be healthy, but it will not acquire the habit of eating largely, and become a large animal. So, when a calf becomes a heifer the training in regard to feeding should be continued and the food be gradually increased until there is established a habit of eating and digesting as much food as can possibly be consumed healthfully. Rules cannot be laid down for quantities of food, for what one animal can eat and still ask for more, would dangerously gorge another. The owner of an animal must make a study of its capacity and watch it, and, understanding the principles upon which the practice of feeding is based, apply them to each particular case with as much good judgment as he can. In a dairy, every cow will probably differ in respect to appetite, and, which is most important, the profitable use to which the food may be turned; and each dairyman will do well to become thoroughly acquainted with his cow in this respect and not make the bushel basket his only guide in feeding.

The discipline of a heifer will make her gentle, kind, docile, easily manageable and contented. Persuasion is a good thing, but a whip is a better—at times. All young animals will be willful, and their wills must be curbed at the first opportunity. It may never be required afterwards if it is used rightly. Every dairy should be provided with a sharp raw-hide. If a heifer needs punishment to restrain some budding vice or propensity to evil, the punishment should be short, sharp and decisive. A raw-hide stings, but does no injury except when used so as to strike an eye, which should be avoided most carefully. The young animal *must* be subordinate and learn its inferiority, or when full-grown it may be dangerous. The first lesson taught to a heifer should be to lead by the head; the next, to be handled. She should learn to lift any foot that may be required at a touch; to turn around by pressure on the hind-quarters in either direction; to submit to handling of the teats and udder. Nothing teaches these better than a daily or occasional brushing and carding when tied up. After each lesson she may be patted and stroked on the neck and will always be ready to lick her owner's hand, even after having been punished for a fault. The worst fault to be avoided is that of kicking. This is always caused by fear, and fear is avoided by having the heifer tied up when convenient and handled quietly and gently. If an effort is made to kick it should be punished at once with a sharp cut of the raw-hide on the offending leg. Inconvenient faults are, refusal to stand quietly when desired and running from its owner. These may be avoided by familiarizing the heifer (and the calf previously) to these duties by giving it a little salt, sugar or meal, in the hand, occasionally and teaching it to come at call and to follow.

Health becomes a habit and is secured by training. Attention to the feeding, watering, cleaning, pure lodging and avoidance of dangerous exposure, will make a robust animal, which will be rarely subject to ailments. A strong constitution is built up by attention to sanitary rules as much as a stout body is built up by generous but judicious feeding. Good, wholesome, clean food, generously supplied, but not in excess; pure water in abundance; a clean skin, free from vermin; pure air and comfortable lodging will secure a good constitution, and may even counteract hereditary failings in this respect. One of the most important points in this regard is the management of the heifer when approaching maternity. The greatest danger is over-feeding and the undue stimulating of the milk organs. It would be safe to gradually reduce the feeding at this time and, if possible, to have the heifer come in when she is upon good grass, so that all the organs are in a cool and relaxed condition. For two months previously the extra food may be gradually decreased, and grass only in the Summer, and hay only in the Winter, be given for two weeks previous to the arrival of the calf. At this time it would be advisable to prepare a separate pen for the heifer in which she could have her calf. As to this, however, nothing more than has been said in regard to cows in the same condition need be mentioned here.

The Herdsman.

NOTES BY A STOCKMAN.

IT is a common opinion that domestication has had the effect of weakening the constitutions of our domestic animals and has rendered them more subject to disease than their wild progenitors. This is by no means justified by facts. That wild animals are hardy and robust may be due to the fact that all the weak ones die young and only the strong are able to reach maturity. But the wild races are really the means of infecting our domestic animals with parasites and parasitic diseases. The liver fluke, which produces a deadly disorder in sheep, and which last year more than decimated the English flocks, is disseminated far and wide by deer, rabbits and other animals. The wild hogs of Europe are affected with trichinosis, and partridges die by thousands from the gape worm. A recent case is recorded of the infection of a whole village on the banks of the Jordan by the flesh of a large wild boar which was affected with trichinosis: 124 men, 103 women and 35 children, in all 262 persons, became diseased, but of these only three men and three women died.

This case proves that domestication does not produce trichinosis, and has not the effect of spreading disease unduly; and, further, it shows that this particular disease is by no means the dreadful pest that some believe it to be. When but two and a small fraction per cent. of persons affected die, and in a Turkish village where medical help is the poorest in the world, the disease is by no means so bad as some others that the public treat with very little regard. The truth is, that under domestication our live stock is not only greatly improved in value, but it is more robust and less disposed to disease than wild animals are.

It ought not to be omitted to state that the body of this wild boar was eaten in a very partially cooked state. The head was sent as a present to a neighboring village and was thoroughly cooked before it was eaten. Not one person who partook of the head suffered any inconvenience whatever.

The breeding and rearing of horses is attracting a good deal of attention. The recent sale of the Preakness yearlings, when 38 one-year-olds brought $25,602, the highest price being $4,100, and the Alexander sale of 36 animals of the same age for $36,265, with $5,650 and $3,250 as the leading prices, have called wide attention to the profit of breeding good horses. Kentucky has the monopoly of this business, as it had for many years the monopoly of breeding Short-horns. In this regard it may be said "it is not the place but the man" that makes success; and why should not other States compete with Kentucky in rearing horses, as they have, in rearing cattle?"

The profit in rearing a three-year-old colt that will sell for $100 only is much greater than in rearing a steer that sells at that age for $50. Just now horse flesh is the most profitable stock that can be produced. There is a steady demand for horses both for working and for driving, at very remunerative prices. The bug-bear of over-supply need not stand in the way of enterprise in this direction.

The great point that should not be overlooked is the breeding of good stock. It costs no more to feed and rear a $300 colt than one worth but $50. The cost of the sire is the only difference. This is now a seasonable matter to make a note of.

Another very important point is the use of only sound mares. The whole country is infested with unsound horses. Spavins, ringbones, founder, roaring, blindness; diseases of "wind, limb and eyesight," are far too common. And, as a rule, these come from breeding mares so diseased. By the veriest neglect and carelessness, and in some cases ignorance of the ill effects, very poor mares are permitted to breed; and to save a few dollars the cheapest and poorest service is sought. This is a wasting of opportunity and a squandering of one's resources. But it is consistent with the practice which permits stock to perish for want of food or water in rigorous seasons, or which sends the good heifer calves to the butcher, rather than spend a few dollars extra in feeding and rearing them to improve the stock of cows.

Byron once sarcastically alluded to the "spasms of public virtue" from which he suffered detraction, perhaps well deserved to some extent. Public opinion, it is true, often goes off prematurely and fails to hit the mark if it does not do mischief. This vice is very apparent in regard to public exhibitions of speed on the track; in fact—not to put too fine a point upon it—in regard to horse racing. Now I must confess to a liking to a well contested trial of speed. As a boy, ambitious to excel, I have entered the lists and have experienced the pleasurable excitements of victory. It is a human attribute and it is reckoned a manly ambition to indulge in athletic sports and the race between a couple of urchins, a pair of college crews, a gang of pedestrians, or a number of horses, furnishes a popular, pleasurable and innocent excitement. The race-

course and the trotting match have undoubtedly done much to foster the enterprise of horse breeding, and to cultivate the demand for good horses. This is a gain to agriculture and to stock interests, and seems to me to be worthy of encouragement.

But, unfortunately, the gambler and pool dealer have forced themselves into the ring and have contaminated the otherwise innocent amusement. How to eliminate this evil has been a difficult task with some agricultural associations whose members have been desirous to encourage the exhibition of horses. It can be done, no doubt easily done. There is a way to permit tests of speed in a legitimate manner at agricultural fairs and to give the horse the benefit of all the advantage that may result from it.

By-and-by the programmes for agricultural fairs will be made up and it might here be made an occasion to urge earnestly upon the managers of these affairs to sturdily cast out these nuisances and to give the noble horse his due share of place and room at the fairs in every legitimate and harmless manner, by entirely separating the trials of speed from every approach to betting or gambling. Horse racing is very popular, and the pecuniary advantage that may accrue from this popularity may be gained without any drawback or injury to the public morals.

Miscellaneous.

What Others Say.

A WRITER in the Mark Lane Express says that for roaming on the prairies of America and over the great runs of Australia and New Zealand, the hardy and docile Merino has not yet been beaten. It is a curious fact that their domestic sheep, tame enough at home, become quite wild when let loose in large "mobs" in the great sheep-producing colonies, while the Merinos, used to almost uncontrolled freedom, know how to use it.

SKILLED LABOR ON THE FARM.—The Editor of the New England Farmer heard a large farmer say recently, that if he could hire a man to work for him that could fill his own place on the farm, so that he could be relieved from some of the responsibility of management, he would pay him as much wages as he was then paying three of his ordinary men, and he was not paying low wages by any means. As mere brute force in workmen is growing less and less in demand, from year to year, as steam and horse-power machinery takes the place of hand labor, so the demand for really skilled labor must increase, and this is quite as true of the farm as of the shop and factory. Young men who aspire to any position in society now, whatever occupation or calling they adopt, must understand that it is good workmen that are wanted. While ignorant, inefficient laborers are always in full supply in every department of industry, it is one of the rarest things to find a first-class workman unemployed. Good workmen are not only needed, they are really indispensable.

SAYS Dr. Hoskins in the Vermont Watchman: "Are we not compelled to believe that the stinginess of the people is a chief cause of the inferiority of our schools? It is a wasteful, a fatal stinginess. A good many besides the editors are not awake as they ought to be to their true "pecuniary interest." The five cent piece is so near their eyes that it hides the dollar in the distance."

DAY'S EARLY SUNRISE PEA.—On June 15 we (the Gardeners' Chronicle of England) received a liberal sample of this pea from the raiser, Mr. John Day, Jun., Ash, near Sandwich, and found the quality excellent, superior indeed to any other early pea we have eaten this season. Mr. Day informs us that they were grown in an exposed field, without a hedge round it, the seeds being sown in November last, and the peas picked on June 13. In the same field and under the same conditions the best strain of Sangster's No. 1 was sown three days earlier, and each was ready for picking at the same time. Early Sunrise, however, made one-third more per bushel in the market than the others, being so much finer and superior in quality. [Sangster's No. 1, is known here as Daniel O'Rourke.—EDS.]

LOSSES OF BEES LAST WINTER.—The American Bee Journal publishes some valuable statistics on the losses of bees last Winter from which we make a few extracts. The tables are compiled from reports on 521,230 colonies or about one-sixth of the whole number of colonies of bees in America. In the following table the first column of figures denotes the number of colonies in the Fall; the second the number that died; the third, per cent of loss.

In bee houses	15,864	3,299	.21
In cellars	91,171	29,734	.33
Protected	145,883	67,338	.46
Total	252,917	100,271	.39
Unprotected	268,313	229,741	.85
Grand total	521,230	330,012	.63

All that were left on the Summer stands, but which were well packed with chaff, leaves, sawdust, straw, or otherwise, are included under the heading "Colonies Protected;" while those left on the the Summer stands with chaff cushion or other slight protection (or none at all), are classed as "Colonies Unprotected." No bees in box hives were wintered in a bee house; 10,656 colonies in box hives were put into cellars, where the losses amounted to 4,393, or 41 per cent. Only 4,704 were protected, and of these 2,016 perished (43 per cent.), while 13 times as many were left on summer stands unprotected, and 93 out of every 100 unprotected colonies perished. Another valuable lesson is taught by the following comparison: Colonies of bees protected by being placed in cellars or bee houses, or by being packed on the summer stands, number 252,917: of these, 100,271 died—39 per cent.; 268,313 colonies were wholly unprotected, but the loss was 229,741—85 per cent.—or nearly thirty thousand more than double the number that died, out of a like number protected! As to kinds of hives used the following table is instructive:

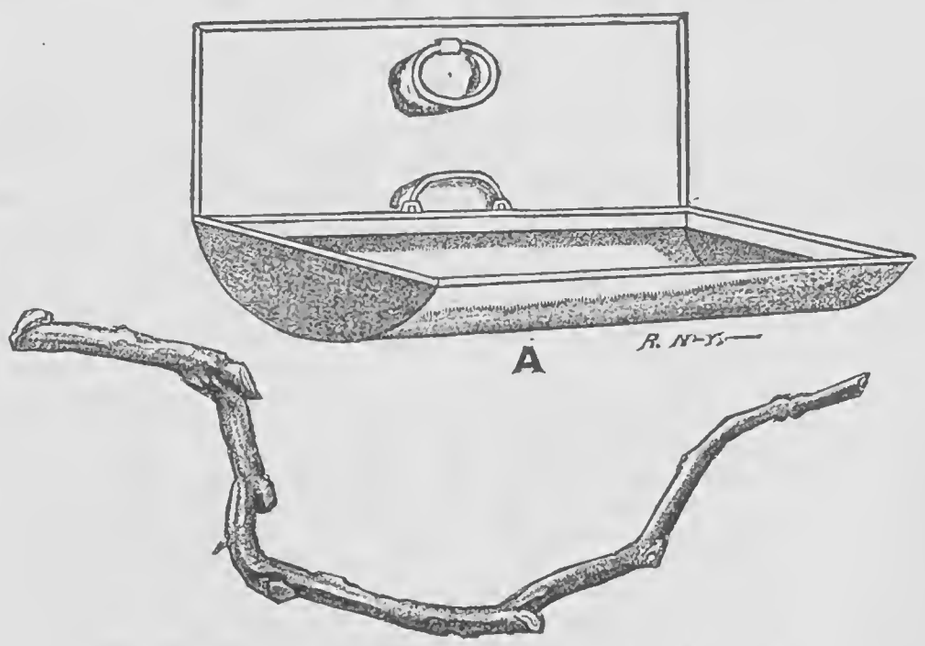
Box hives	211,732	187,705	.89
All frame hives	309,498	142,307	.46
Langstroth	196,957	83,965	.43
Other frames	113,541	58,342	.51
Grand total	521,230	330,012	.63

It will be readily seen that while the average percentage of loss in box hives is 89, in all the frame hives it is but 46—an unanswerable argument in favor of frame hives.

SELLING MILK IN BOTTLES.—H. Stewart, of Bergen Co., N. J., tells, in the Country Gentleman, how he persisted for a year in endeavoring to establish a custom for milk put up with every care in Warren milk bottles, sealed up and carried under ice to the customers, and how and why the laudable enterprise proved a failure. As to the "why," he attributes it to the indifference and neglect of customers, who often failed to return the bottles, sometimes returned them broken or minus the rubber rings, and very generally unrinsed, with soured milk dried on the inside, making them very troublesome to clean. Many refused the bottles, not wishing to have the trouble of preserving and returning them. Mr. S. tells the story simply and with seeming fairness. He says that he would prefer the bottles, as the milk is then already measured and packed, convenient for prompt and clean delivery, like the general stock of a modern grocery. But the general experience, he says, coincides with his, and proves that the losses are too great, and that, in short, it doesn't pay.

ROSA RUGOSA AND ITS VARIETIES (see Fig. 353).—"I must say these plants are too little known, otherwise they would be more largely grown; and, possessing three very distinct characteristic qualities, viz., beauty in flower, in foliage, and in fruit, they should be recommended to all true lovers of gardening. They also make good single specimens on the lawn, on the tops of mounds and like places. The fruit when ripe is delicious, and I believe largely used as a preserve in its native habitat." So says a writer in the London Garden.

PRESERVING EGGS.—Mr. Henry Stewart gives the New York Times an instructive article upon the subject of keeping eggs from the time they are cheap and plentiful until they are scarce and dear. The man in any business who makes the most profit is the one who lessens most the cost of his product. And the poultryman who will get rich next Winter and make the least boast of it is he whose hens are now laying each four or five eggs a week; and these are carefully packed away while perfectly fresh so as to come out next Winter equal in all respects to the new-laid, and selling at nearly the prices of fresh. Perhaps some persons may consider this a questionable business. But is it? Eggs sell on their merits; and if, by preserving them so that in six months they are in every respect equal to new-laid eggs, in what respect does this differ from preserving Summer pears or grapes in ice-cold store-rooms for sale six months afterward; or canning honey for future sale; or other similar methods of holding over surplus products for future periods of scarcity?—always excepting, however, any attempt to deceive the purchaser by untruthful representations, and always disposing of the eggs as preserved ones and not as fresh. There are several methods by which eggs may be perfectly well preserved for six months, and this is the season for putting these into practice. To relieve the market of its surplus now, and also to relieve it of its scarcity in the Winter, would tend to equalize prices, to raise them now and to moderate them then. But, as the preserving requires both care and regular attention in the Summer time and some little neatness and skill, and the majority of persons are averse to taking the requisite trouble, there will probably never be a sufficient quantity of eggs kept over to have an effect upon prices in the directions referred to.



CONTRIVANCE FOR CATCHING THE POTATO BEETLE.—FIG. 358.

The common methods of preservation all depend for their effect upon closing the pores of the shell and excluding air from the perishable interior. It is also especially requisite that the eggs be treated while they are perfectly fresh, for if decay has begun it cannot be arrested by any known process. The most popular preservative is lime, used in the following manner: A tight barrel is half filled with water, into which are stirred slaked lime and salt, at the rate of half a pound of each for each pailful of water. Some dealers add four ounces of saltpeter to the half barrel of pickle. The eggs, perfectly fresh and gathered twice a day, are placed in a shallow dish and carefully let down into the pickle, in which they settle to the bottom, always with the small end downward. The barrel will be filled when it is half full of eggs, the equal proportion of pickle making up the difference. A cool place for storage is required to keep the eggs. The pickle has a certain corrosive action upon the shells after two or three months, but to avoid this the eggs may be smeared with lard before they are put in the pickle.

Another method used for domestic purposes is as follows: The eggs are placed in a convenient willow basket or net, and are immersed for five seconds in a boiling solution of five pounds of common sugar to a gallon of water. The heat sets the albumen in a film on the inside of the shell and the sugar closes the pores. The eggs are then packed, small ends down, in a mixture of two parts of dry bran and one part of finely powdered charcoal. The French, who produce and keep enormous quantities of poultry, have several methods of keeping the eggs. All of them, however, are alike in respect to the materials employed. These are oils and wax. One of the best of these processes is as follows: Four ounces of bees-wax are melted with eight ounces of olive oil. When the mixture has cooled to a safe temperature each egg is dipped into it and wiped with a soft cloth to remove the excess. The eggs are then packed in boxes in powdered charcoal, freshly burned, and have been thus kept perfectly fresh for two years. Fresh charcoal is desirable because of its excessive affinity for oxygen, which it absorbs and occludes within its pores, thus keeping the eggs free from contact with the only agent of decay that is to be feared.

Paraffine is odorless, tasteless, colorless, harmless and cheap; it is a mineral wax or fat, and may be used instead of bees-wax or oil with equally good effect. As it melts and becomes liquid at a little over 100°, it is easily applied and easily removed when the eggs are boiled for use. Fresh charcoal finely powdered is at least four times as effective a preservative as the lime pickle. Dry salt has been recommended for keeping eggs, but it is totally useless where the air is at all damp, as it is in a cold cellar. Water glass—soluble silicate of soda—has been used by the Germans for keeping eggs. This is a clear liquid, of the consistence of syrup, and, when smeared over the shell, soon dries into a thin, hard, glassy coating, entirely impermeable to the air. Eggs are to be packed with the small ends downward, because in that position the yelk is suspended exactly in the center of the egg and does not touch the shell. When it touches the shell and air reaches it, decay instantly begins. One stale or broken egg will spoil a whole barrelful. The packing should be so placed between the eggs that no two shells come into contact. An even and cool temperature is necessary. A changing temperature causes disturbance of the air among the packing, and starts a molecular action in the egg, which is favorable to, if not productive of, decomposition.

A MAN is known by the company he keeps out of.—Independent. . . . . "How much butter do you suppose I have sold this year?" "All you made," was the reply of the neighbor who knew his miserly habits. . . . . It is a mistake to assume that a rose by any other name would smell as wheat.—Yonkers Gazette. . . . . Every lie, says Owen, must be thatched with another, or it will soon rain through. . . . . A Georgia editor says:—"Gold is found in thirty-six counties in this State, silver in three, copper in thirteen, iron in forty-three, diamonds in twenty-six, whisky in all of them, and the last gets away with all the rest." It is so, more or less, with all the States of the Union. . . . . Mr. J. S. Woodward says, in the last Report of the Michigan Pom. Society, that in selecting a location for grapes on the farm of course there is a choice. The grape, to show the best results, should have a soil with more or less clay; but they do fairly well on almost any soil, *if it is dry*. Remember the grape is nearly as sensitive as the peach to having *wet feet*. Unless your soil is naturally dry, see to it that it is made so by a few deep-surface ditches, or, what is better, under-drains, put deep. . . . . Mr. Woodward also said that he did not wish to say anything against quality in the grapes, but that quality is not everything. "What is the good of quality without grapes?" he asked. . . . . For farmers' use we want *certainty*. . . . . The first thing to be looked to in selecting a vine is its *leaves*. These are more important than all else combined. We want the leaf healthy and able to withstand the attacks of both insects and diseases. Next, see that the vine is a strong grower. But if it have large, thick and persistent leaves, it can hardly fail in this respect.

Entomological.

A HANDY "BUG-CATCHER."

WITH the pan I use for catching Colorado beetles any one can do as much work as three or four people collecting the pests according to the ordinary method of hand-picking. The pan Fig. 358, is made of tin, and any tin-man can fashion it. It is a box or pan, two feet long, one foot wide and six inches deep. The bottom should be round, or cylindrical, so that the rim of the pan can be got close to the ground when the vines are small. Stiffen the edge with wire. On the inside, at the top, solder a rim or flange about three-quarters of an inch wide. This should slant downward somewhat, as its object is to prevent the "bugs" from crawling out when once they have got in. On one side of the pan solder or rivet a handle such as those on common tin milk pails. On the same side as the handle solder a shield of tin 18 inches high and of the same length as the pan, slanting backward a little. The edges should be stiffened with wire. About four inches from the top of the shield, and in the center, solder a loop or ring large enough to admit the arm to the shoulder. In using, insert the left arm through the loop and grasp the lower handle with the hand, then, holding the pan close up to the vines and near the ground, with a crooked stick, like the one represented, gather the vines over the pan, giving them a smart shake against the shield and over the pan. A good, active man, with this contrivance can "bug" an acre of potatoes effectively in two hours. G. W.

[In the above description, unaccompanied by any drawing, we infer that the two handles are to be placed on the inside of the tin shield, but could they not be on the outside just as well, yet occupying the same relative position? We would suggest that braces from the upper corners of the shield to the ends of the box would add greatly to the strength of the "bug-catcher." EDS.]

RURAL SPECIAL REPORTS.

Arizona.

PHŒNIX, Maricopa Co., July 14.—The principal crops here are barley and wheat. Corn is not cultivated to any extent; what is raised is principally for green corn for the table; the country is too dry for this crop. Sorghum grows exuberantly and is cultivated considerably for fodder and sirup. There are no extensive orchards; all kinds of fruits flourish except, perhaps, apples and pears. Every sort of vine yields abundantly. All our products are consumed in the Territory except those of our mines. F. A. H.

Arkansas.

BEEBE, White Co., July 14.—It will be three years next March since I came here, and I am satisfied that the big stories told about this part of the country are not true. The soil will not produce such crops as some correspondents report. It takes just as much labor to prepare the ground for our oats, corn, millet, etc., as it does up North, and we only get half as much of a yield per acre. Of oats I get from 15 to 20 bushels per acre, and of corn from 12 to 20 bushels. On old ground millet will not do well unless manure is used, and we have nothing here to make manure of. Cotton is the only crop on which money is made, and but little is made on that. Flour is from $8.50 to $9 per barrel on credit, $6.50 to $7 for cash; best grades still higher. I do not think this is as much of a stock country as some make it out to be. There is nothing here for stock to eat but bushes. I have tried to raise grass ever since I came here, but it is killed out by drought or severe Winter weather. I brought two good cows with me from the North which would make four and a-half pounds of butter a week each, but here I cannot make butter enough from them to use. Hogs are never killed here until they are two or three years old, as the people say they do not get their growth before that age; but the reason is, they haven't corn enough to fatten them sooner. Some feed a little corn about two weeks before killing, to harden the meat. I was told that peaches never fail here, but this season there are none. Strawberries, half a crop, and blackberries none. Apples are very good. I have shipped some early ones, but late ones do not do well. Sheep up North are just one half larger than here; so is everything. The people think the wolves kill the sheep, but I tell them it is the dogs, of which the white farmers have about four each and the blacks still more. The people are very clever, but ignorant. They go to town on Saturday to get the news, but do not take the papers. Some want free schools and some want none, and the teachers are all poor. I have never worked so hard as I have since I came here, and we have not made over 50 cents per day in a year. It costs about one-third to get stuff to market in St. Louis. Last week we had two nice rains, which helped corn very much H. B.

California.

PENRYN, Placer Co., July 15.—We do not raise enough wheat or corn here for home consumption. All kinds of orchard fruits are good crops. Berries are not up to the average, except blackberries. Prices of fruits of all sorts have ruled low. E. W. B.

PENTZ, Butte Co., July 17—The wheat crop in this section is light. The Ennobled Oats turned out good. I sowed six pounds (which I raised last year) broadcast on about one-sixth of an acre and harvested eight bushels. The straw very heavy and the heads fine. W. H. S.

SOQUEL, Santa Cruz Co., July 15.—The wheat crop in the vicinity of Soquel is not an average compared with last year; the same is true of barley. Very little rye is grown. Oats are mostly cut into hay. Owing to the extremely wet season the farmers could not get in their usual grain crops, and as a last expedient planted corn as late as May 25, which crop never looked better. The majority of corn growers rarely market their corn, but feed it to stock. In San Francisco fruit dealers are in the hight of a busy fruit season, with an abundance of everything, at better prices than usual, owing to an increased demand for canning. R. H.

Dakota Territory.

FARMINGTON, McCook Co., July 14.—The acreage of wheat is at least one-fourth greater than last year and the outlook is very promising. Oats are looking well and bid fair to give a good yield. Barley is an excellent crop and does well in this locality. I have 10 bushels sown upon last year's breaking and can ask for nothing more favorable. Corn, as a general rule, is not very flattering owing to poor seed, late planting and unfavorable weather. I have several different varieties and fields, all of which are excellent; Blount's White Prolific and Chester Co. Mammoth are just "booming." I have also white and yellow dent, Calico, etc., the present bad outlook for corn is owing more to the negligence and carelessness of the farmers in general than to anything else. Some expect a crop without any exertion. An unusually large amount of flax was sown this season and it promises to be a good crop. I think it is safe to say that the acreage of all kinds of grain compared with last years is one-third greater. We have a new country which is rapidly settling up. Three years ago there was little or no grain raised in neighborhood. No orchards; some have a few young trees that are doing well and I think fruit trees will do well here. We have the finest wild fruit I ever saw, in abundance along the Jim River and various other streams. Small fruits have not been much introduced here, but there are those that have some started and they are doing well. Strawberries are of an excellent quality; that is, those that grow wild, and they are only in places that have not been burned over. I have also seen tame ones that were excellent. There are some who approve of burning off the surplus grasses annually. I am not a practical farmer, but I do not approve of the burning process. I have derived more knowledge on agricultural and horticultural matters through the columns of the RURAL than from any other source. It has helped me in very many respects; some simple advice on what might be considered small things has benefited me more than ten times the amount of subscription price. W. S.

SPRINGFIELD, Bon-Homme Co., July 12.—The acreage of all kinds of crops is much less than it would have been had not the season been so backward. The yield of wheat will not exceed one half crop. Barley and rye and flax little better. Oats look well but will be short in straw. Corn late, much of it thin on the ground on account of poor seed. Looks well. Small fruits have done well. There are but few orchards old enough to bear. M. C.

Florida.

MARION Co., July 17.—There is no agricultural association in this county, so that statistics of the areas under different crops are mere guesses; or, at best, estimates. I would say, however, that in this county 500 acres of oats were harvested this year, giving, on an average, about 15 bushels per acre—which is very fair for our lands. No wheat, barley or rye. Rye would yield, comparatively, as well as oats, but there is more uncertainty of a crop. Of oats, Georgia and Mexican rust-proof alone are worth sowing. The corn prospect is the worst for many years, owing to unseasonably cold weather in Spring and a severe drought in May and June. Probably the crop will not average five bushels per acre. The area of the crop is probably 10 per cent. greater than last year. Peaches promise a fair crop. The peach-tree is usually short-lived here, but the fruit is very fine. The tree is sometimes troubled with worms, but the fruit, never. The orange crop will be greater than last year, owing to the increase of bearing trees; but the yield per tree will not be so great. J. L. W.

Indiana.

SANDBORN, Knox Co., July 13.—Since my report to the "Crop Special" of the RURAL, the crops here have changed a good deal, so that what I truly said then with regard to them would not be true now. A quarter of the wheat crop is threshed and turns out to be only from a quarter to a third of an average crop, and that of poor quality. Corn is generally good; hay is good, but there is no market for it. This is in the great Winter-wheat belt, the two adjoining counties being the "banner" wheat counties of the State. "H."

Iowa.

EAST DES MOINES, Polk Co., July 14.—Hereabouts there has been a more general failure of all crops, except oats, than has ever before occurred—causes, late planting, defective seed and wet weather. W. T. L.

DAVENPORT, Scott Co., July 18.—The total yield of wheat will be much less than last year in this county. Owing to several successive failures of the crop many farmers have entirely abandoned its cultivation and others have reduced the area formerly given to it. Sea Island and Odessa are the favorite sorts. The Winter sort was all killed. The acreage under barley is greater than last year, as it is the sort of small grain mostly raised here. It was greatly injured by rains in the latter part of June and the beginning of July. Though the quality will be inferior, the yield will be good. Early-sown oats are good; but late-sown are thin—acreage about the same as last year. The outlook for corn is poor owing to late planting, bad sprouting and cut-worms. Acreage about the same as last year. C. W. L.

Kansas.

RENO Co.—Kansas is a wheat-growing State remarkably adapted for it by nature. The elements for producing strong straw—indeed all plant stocks—are very abundant in our soil. Very little headway can be made mowing here with a scythe, the silica, or silicates, so permeate the stems of the grass, millet, wheat, etc. In 1878 this State came into prominence as a Winter wheat producing State. In 1879 a hail storm in this county destroyed what the early drought had left of our wheat, and 1880 was like '79—we had a long-continued and severe drought and but a very little wheat was grown to spare in Western Kansas. Rains came last Fall and with a favorable Winter and mild Spring our prospects for this year were early recognized as being very good and many placed our average yield as high as 20 bushels per acre. The immense rains that came early, accompanied by warm weather, caused rust to make its appearance about the time when wheat was in bloom, which, of course, interfered with our crop. This was followed by an almost unprecedented development of chinch bugs; fields were literally alive with them, at least on some varieties of wheat; on the May wheat worst of all. These influences—rust and chinch bugs—weakened the straw and it early began to fall, and ere it was ripe enough to cut, large fields were straw-fallen to a degree to almost defy machinery except the mower. On the 25th of June came a hail storm of terrible severity accompanied by severe wind and an enormous rainfall—10 inches on the level—and the wheat remaining uncut—probably three-fourths of all in the county that was in the line of the storm—was destroyed, as was everything else. Fields of from 25 to 100 acres, that would have made an average yield of 25 to 30 bushels, were threshed out and beaten into the earth. All these untoward things tend to diminish our crop. Some Spring wheat was sown but the rust and wet weather destroyed it. The principal varieties of wheat grown here are May Walker, Turkey, Fultz, Mediterranean and some little Clawson. The Fultz and Mediterranean were free from rust and chinch bugs on my farm. The finest berry I have seen this year was in the last named. Wheat is largely cut here with headers. Self-binders and harvesters, etc. are also used. Harvest begins about the 1st of June and lasts through the month. We are in a state of great uncertainty as to what to do in regard to sowing for next year. The chinch bugs are so numerous that we fear the entire destruction of wheat another year. Large fields of corn that escaped the hail storm are now black with bugs. The railroad monopoly causes us to take a small price for our wheat, as a rule—from 40 cents to 75 or 80 cents; it is worth the latter figure now. Would it be any more than simple justice to place railroads under control of law enough to give us uniform *fair* rates and prevent extortion and monopoly? J. W. MEC.

Michigan.

KALAMAZOO, Kalamazoo Co., July 10.—In traveling between Albion and this place on the railroad, I only saw two good stands of corn and three good fields of wheat. People generally, however, are feeling in good spirits over Fall prospects. W. K.

Missouri.

CHARLESTON, Mississippi Co., July 12.—The drought which had prevailed since the first week of May ended on the 21st ult., after damaging the early potato crop 40 per cent., and the corn crop, 25 to 30 per cent. With a good season, however, from now until September 1, we shall have good crops; otherwise the horn of plenty will not be filled to overflowing. The wheat crop of this county in quantity is a good average, and in quality the best ever harvested. Our farmers made greater efforts than usual to secure the best seed. M. V. R.

New Hampshire

KEENE, Cheshire Co., July 13.—The weather is very warm and farmers are pushing haymaking rapidly. "B."

New York.

CHENANGO Co., July 15.—Haying is advancing rapidly, many farmers having finished. The yield is good, especially in the Unadilla Valley, where the crop is seldom better. In Madison County I noticed, a few days ago, that the crop is light, especially on old meadows. The hot weather is pushing the drowned corn vigoronsly; the crop now promises finely. The potato beetle is as rampant as ever, though Paris-green is a valuable sedative. Oats look well. Wheat is nearly ready for the sickle. The long-continued east wind, or some other cause, has checked the fruitage of the orchards, which blossomed full. Apples will not be plentiful. E. J. R.

FISHKILL, Dutchess Co., July 17.—We are still having an abundance of rain and the country is looking fine. J. G. B.

Ohio.

CAMDEN, Preble Co., July 13.—Weather very hot and terribly dry. Our corn is beginning to curl up very badly. Pastures are getting burned out and are quite brown. My Blount Corn is tasseling. The Rural Sorghum is doing well. It is too dry for the White Elephants; they have been blossoming for two weeks. The Washington Oats are good; Mold's Ennobled Oats are quite a failure. W. M.

Oregon.

BROWNSVILLE, Linn Co., July 12.—Wheat acreage fully an average; outlook good for a large yield—Club, Sonora and White Winter. Oats and barley have an average acreage, and promise large yields. Corn but little raised. Orchards, average yield. J. B.

Pennsylvania.

ANNVILLE, Lebanon Co., July 18.—Wheat is now harvested; it is about 75 per cent. of last year's crop; quality on an average good—Mediterranean and Fultz. Oats promised to be an extraordinary crop. The corn prospect is very good. Early potatoes pan out immensely; acreage larger than last year; worth about 50 cents a bushel. Apples promise an ordinary crop; so do pears and grapes. J. A. B.

Texas.

ARCOLA, Fort Bend Co., July 16.—This is the Texan sugar belt. Owing to the severity of last Winter the cane stubble was nearly all killed, and it will take three years to make a full crop of sugar here. Corn is burning up in the fields; we have had no rain for eight weeks. What corn there is has made only nubbins, and there is not half a crop at that. Cotton is doing well, and this is just the kind of weather to have for it. It is well formed and has commenced to open. The acreage is about the same as last year; but the crop is fully 10 per cent. better. The Rural Branching Sorghum is just splendid; it is now over 10 feet in hight, with 19 branches to the hill. I want to let it all go to seed, which I hope it will do here. F. W. P.

DAYTON, Liberty Co., July 10.—No rain for a month, and corn is suffering severely. Cotton is beginning to shed its squares. My RURAL flower seeds have all perished under our broiling sun, and the White Elephant is going the same way. I tried watering, but it did no good. The Rural Branching Sorghum is doing splendidly, the dews feeding its roots through its mass of leaves. G. G.

Vermont.

HUBBARDTON, Rutland Co., July 18.—Wheat in this section is good; I never saw it looking any better at this time of the year—mostly Spring wheat—and the prospect is now that the crop of 1881 will be more than an average one; it will certainly be more than last year's if no mishap befalls it. The oats are looking well now; the crop will compare favorably with last year's. Rye is good, although it was winter-killed in some places; taking it all in all, the crop is a fair one, though there was not so much sowed last Fall as usual. The apple crop will fall far below an average. Grapes will be good. All small fruits are light. E. G. S.

Virginia.

FORT MITCHELL, Lunenburg Co., July 19.—The wheat harvest is over and the farmers are in the hight of thrashing. The yield is over an average; quality generally very good. The oat crop is very poor, many fields being hardly worth cutting owing to a severe drought. The corn crop looks well and a full crop is planted. There will be rather over half a crop of tobacco which is rather late owing to drought at planting time. Cotton looks well; it is rather a new crop with us; but owing to the very low price of tobacco large numbers of the farmers have tried King Cotton, some on a large and some on a small scale. Owing to dry weather the hay crop is short. Gardens late and poor. The Washington Oats received from the Free Seed Distribution have been harvested and the yield was very heavy. The Rural Branching Sorghum is about four feet high and outbranches anything we have ever seen in these parts in the shape of sorghum or corn. It is a perfect wilderness. How is it for sirup? [So far as we know no practical tests have ever been made in getting sirup from it. Eds.] It doesn't seem to me it will do well owing to the immense number of small branches, but it must be fine for hay or ensilage. The apple crop is the heaviest for many years. The peach crop is a total failure in many places: on high ridges, however, the crop is good. J. L. T.

NEW MARKET, Shenandoah Co., July 15.—The Telephone Pea has done wonders, I am highly pleased with it. We have had hot, dry weather for the past two weeks, the thermometer ranging from 85° to 101° in the shade. On July 2nd we had a very destructive hail storm. P. S. W.

The Querist.

ANSWERS TO CORRESPONDENTS.

Churning—Asparagus Culture.

Inquirer, Crawford, asks, 1, how long should butter be churned after particles of butter appear on the sides of the churn; 2, what do we personally know of the German or Dutch asparagus; 3, directions for the planting and field culture of asparagus.

ANS.—1. Sometimes particles of butter appear in the churn some time before the cream is fully changed into butter. In some milk and under some circumstances, particles of butter will even form in the milk pail from the agitation of the milk during milking, and the cream of such milk will produce particles of butter long before the bulk of it is changed. It is also very uncertain how long the cream should be churned after the small butter begins to form, as this depends upon a variety of circumstances, as temperature, condition of the cream, the food of the cows, etc. It is a matter of practice for

which no strict rule can be laid down, any more than the time occupied in churning can be restricted to rule. The rule should be to examine the cream as soon as the peculiar "slip-slop" sound is heard, and to take no notice of scattered particles of butter that may appear, but when the fine butter begins to form all through the cream to turn the churn slowly, by which the fine butter is gathered more quickly and in better condition than by quick churning. It may take five minutes, or less, or 15, or even more, to gather the butter; but the time may be shortened in Summer by putting some ice water in the churn, and in Winter by adding a little warm water. 2. Nothing. 3. Plow deep and thoroughly pulverize the land. A sub-soil plow is desirable. Select a sandy loam if possible Plant in rows *not less* than three feet apart, the plants one foot apart or more—not less. One-year-old roots if well grown are best. Salt is considered an excellent dressing for asparagus unless the plantation is near the sea. The field may be dressed with any quantity of manure. We are of opinion, however, that a reasonable quantity—say 20 tons to an acre—answers just as well as the immense amounts sometimes used.

A Drag Rake for Hay.

"Subscriber," Stanwood, Kansas, asks for a plan of a drag rake for hay.

ANS.—The drag rake is made as follows:—A stout pole is bored at intervals of six inches so as to receive rake teeth one and a-half inch thick and four feet long on each side. These should be of tough wood, either white oak or hickory. The rake teeth are tapered and pointed at the ends so that they will easily slide over the ground. The rake head is about 11 feet long,

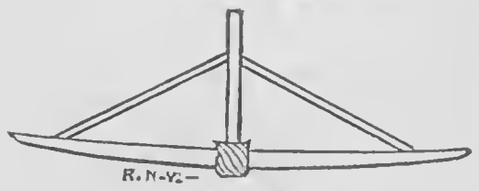


FIG. 359.

and when finished appears as shown at Fig. 363. The end teeth are of extra strength, and are braced to a post set in each end of the main bar, as shown at Fig. 361. The bracing is required to strengthen the post, because the weight of the draft comes upon it. A center post is fitted in the middle of the main bar and two strips are bolted to the end and middle posts, as shown at Fig. 359. The ends of the drag consist of gates made as shown at Fig. 360, and hinged strongly to the end posts. Each of the end gates has a stout ring fitted

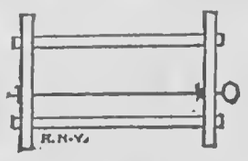

FIG. 360.

to it, as shown, and the bolt should pass through the rear post and be secured there by means of a washer and nut. The ends swing around on their hinges so that the rake, which is a double one, may be drawn either way. A horse is hitched to each end and is ridden by a boy; the rake gathers up its load and is drawn to the stack or barn, when the horses are swung around, drawing the ends around at the same time, and the rake is drawn out from under the load, leaving it ready to be forked up to the stack or in the windrow. The drag may be eleven feet long and eight feet wide, that is, four feet on each side; the center may be four feet high. It will hold 500 pounds of hay, when filled.

Quack Grass—Migration of Swallows.

G. C. B., North Rochester, N. Y., sends grass for name, which is very tenacious of life and is there called "Dog Grass," and asks, 1, how to exterminate it: 2, where do swallows go in winter. A learned neighbor of his says they go into the mud.

ANS.—1. The grass is a kind of wheat often alluded to in this journal. Its name, botanically, is Triticum repens. Couch, Quitch, Quick, Rye Grass and Quack are some of its many "common" names. If a field infested with this, be planted to corn and well cultivated during the season, the Couch Grass will have been killed, root and stem. There is one thing to be said against suffering this grass to get a foothold upon one's farm, viz, it is *hard* to get rid of. But, as we hope to show some day, there are many things to be said in its favor. We have just cut one old field, three-quarters of the grass upon which was "Quack," and harvested two tons (or nearly) per acre therefrom. 2. There are more than 50 species of swallows, differing more or less in shape, habits and time of migration. None of the 50 go into the mud in Winter, so that that learned ornithological neighbor of yours must be, for once, in error. The cliff swallows, however, have occasionally been found hibernating in the inmost recesses of their nests instead of migrating southward, like the rest of the genus. They all go as far south as the Tropics where swallows are seen in the greatest numbers in our midwinter season. The barn swallows start southward in large flocks by the end of August or the first of September on some fine morning, following the shore or course of rivers. They reappear in the Southern States from the middle of February to the first of March, a few at a time, reaching the latitude of New England in mild seasons by the middle of May. The white-bellied swallow or house martin comes the earliest of all in Spring and generally leaves the last or almost the last.

Cow Milkers.

S. C. B., Deadwood, D. T., having heard about a newly patented "cow-milker" with which a friend's friend is reported to have milked 100 cows a day, asks as to the merits of this and other milking devices.

ANS.—There have been many so-called milking machines and devices for drawing milk invented and puffed into transient notoriety, but all have failed. We suspect your friend's friend never milked 100 cows with a machine, and that there is some misunderstanding about it. The cow can't be made to submit to any machine. The engraving here given represents a milking machine of which some thousands were sold by profuse advertising about three years ago. It consists of four silver tubes to be pushed into the teats, each attached to a rubber tube, and these are gathered together at the end as shown. The cows, and owners who used these machines regularly, came to grief, for the tender mucous membrane of the teats and udder, which is as sensitive as the peritoneal membrane of the abdomen, became inflamed by the contact of the tubes: and garget and other troubles supervened. Here is the difficulty. The writer in pursuit of knowledge and experience devoted two good cows to experiments with these machines, and persevered to the end with them with the effect of completely ruining one old cow, and nearly spoiling a young one in less than two months. The milk flows perfectly well, but the irritation of the tender membrane is a serious evil. Other machines, operated by air pumps which cause suction and are intended to milk a whole dairy of cows at once, have been introduced, but the thing wont work and the pipes and tubes and attachments to the teats give endless trouble and bother. We know of none of these milking devices in use at the present time; but know of many that were discarded very soon by dairymen who would gladly have made them successful if possible.

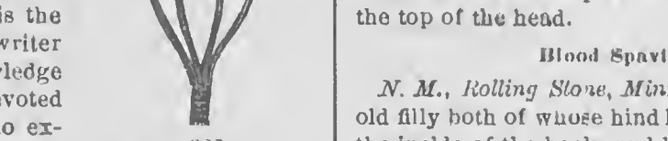

FIG. 361.

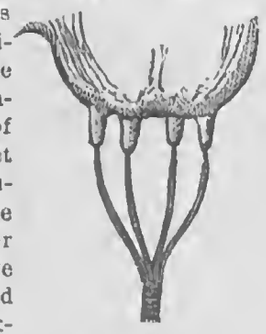

FIG. 362.

Treatment of a Young Calf.

J. B. R., Rouseville, Pa., says:—"I have a calf eleven weeks old, that has as yet eaten no grass. It is in good health apparently, and lively, though somewhat thin in flesh. It gets about two quarts of corn and oats chop and bran mixed with skimmed milk nights and mornings. Its teeth appear to project, so that their edges come outside of the upper jaw when its mouth is closed. They are somewhat loose, and the calf is continually rubbing them against the board fence. What should be done under the circumstances, if anything?"

ANS.—This calf has been perhaps over-fed with grain. A young animal requires judicious feeding and before any grain is fed it should begin to eat hay or grass. The looseness of the teeth indicates disordered digestion and an inflammatory condition of the system. It would be better to give the calf a little fine grass or clover wetted and dusted with the chop and bran, and withdraw the clear meal until it eats the grass with relish. A calf of this age should eat at least a bushel basketful of grass or clover daily, and until it takes this naturally and with good appetite it would be well to give only a small quantity of meal. Grain food should not be the base food for a young animal, but only the additional ration added to the base food to increase its nutritiveness, and the grain should be given with care to see that it is healthfully digested and assimilated.

Ailing Pigs.

A. J. B., Belmont, Miss., says that his hogs, and especially his small pigs, have of late been attacked by a disease in the ear, which becomes completely raw inside; the green fly then "blows" on the place and the hog dies soon afterwards; sometimes it holds its head to one side, as if it had the blind staggers, and our friend asks for some preventive and remedy.

ANS.—The cars should be cleansed with soap-suds and then the parts affected should be touched with a mixture of carbolic acid and water in the proportion of one drop of acid to twenty of water. The sore should then be smeared with gas coal-tar, which will keep the flies away. The smearing with coal-tar should be repeated every two or three days until the ears are healed. The gas coal-tar is healing and antiseptic, and may be a sufficient remedy without the application of the carbolic acid. Staggers may be relieved by bleeding in the neck followed by an active physic—a pint and a-half of linseed oil or a pound of Glauber salts. Bran mashes should be given afterwards for a week. If horses are liable to this trouble, their heads should be shaded in hot weather with a canvas or cloth hood, which may be stretched on a wire frame-work and attached to the bridle and suspended a few inches over the top of the head.

Blood Spavin.

N. M., Rolling Stone, Minn., has a one-year-old filly both of whose hind legs are swollen on the inside of the hock, and he asks what is the remedy.

ANS.—This is a case of blood spavin, an ailment to which young horses are peculiarly liable. It has no relation to bone spavin and is usually comparatively harmless. As treatment a persistent application of cold water will generally be effectual in the early stages, followed by cooling lotions—equal parts of alcohol and water, or a pint of brandy mixed with half a pint of water, applied as a lotion. In later stages a strong infusion of bayberry bark should be applied and, lastly, brandy and salt should be perseveringly applied.

Watering Trees.

H A. P., Zanesville, Ohio, asks whether it is advisable to water deciduous shade trees and evergreens a great deal in Summer. A neighbor of his waters his trees thoroughly every night all through Summer.

ANS.—Generally we do not think it a good plan. The earth becomes hard over the roots and air is excluded. When trees are newly set out and evidently suffering for moisture, the best way is to remove the surface earth and give the roots a good drenching. Then replace the surface earth and cover with leaves, old manure, straw or hay This will carry the plant through the drought, and it will thrive better than if watered every night according to your neighbor's practice.

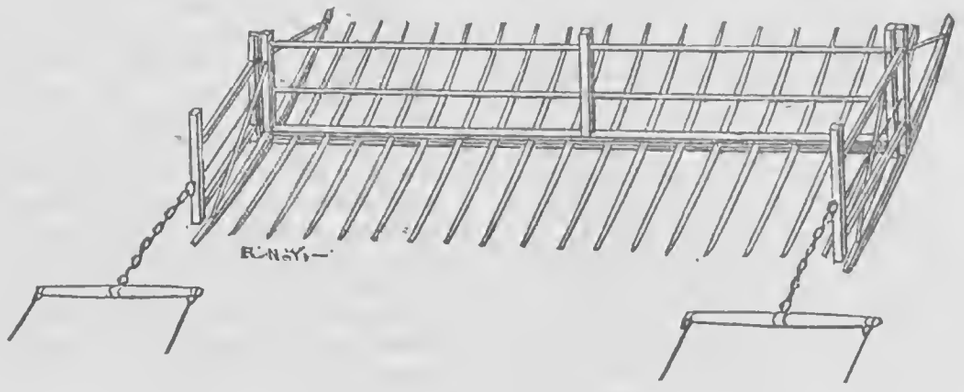

FIG. 363.

Information Wanted.

J. C. Dyson, Washington, Ga., writes: "The RURAL's correspondents, Messrs. Holmes and Sweetland say that the herd or fence law in Iowa is the poor man's friend. An election on which the question of establishing a herd-law depended has just been held here, and has resulted in the defeat of the proposed law by a vote of nearly five to one, the majority being swelled by all the poor men—negro and white. I would therefore like to know something about the provisions of that Iowa herd law which is a boon to the poor man. A good law of the sort would be worth thousands of dollars to farmers here; but they can't have it because the poor man thinks it would curtail his privileges—or rights, as he deems them"

Miscellaneous.

W. H. P., Mt. Eaton, Ohio, in the RURAL of June 9, complains of some White Russian Spring Wheat which he ordered from a N. Y. seedsman and which came to hand poor and shriveled. It came up nicely, but after a time stopped growing and he asked whether its stoppage was due to the fact that the seed was shriveled or to the climate. We replied that in our experience wheat grew fairly well from shriveled seed, but that the grain was smaller; and the heads longer. Our friend A. M. writes, from Bay City, Michigan, that the trouble was due to the fact that White Russian is a Winter wheat, and having been sowed in Spring it will not mature until "after it has encountered the frosts of Winter." White Russian wheat, however, is a Spring variety, although it is often sown in Fall in some parts of the country. As W. H. P. sent for White Russian *Spring*, however, it is highly probable he got the Spring sort, so that the above "explanation" of the trouble will not "explain" it. We have raised both kinds of White Russian wheat at the Rural Farm, and have succeeded in changing the Spring into a Winter variety.

S. F. B., Buckeye Center, Ill., has a grape vine, 43 years old, that has never borne a grape though it blossoms every year. It is a fast grower, the vine increasing from 14 to 20 feet per season, and he asks, 1 what will make it bear fruit; 2 a remedy for light on fruit trees; 3. where can Tree Peonies nght and at what price.

ANS.—The blossoms are probably sterile—that is; they have no stamens. If you would procure pollen from other vines and dust it upon the blossoms as soon as fully open, we think such blossoms would bear fruit. This is neither so impracticable nor difficult as it seems. 2, Nothing that we know of. Saw or cut off the branches as soon as it appears. Wash the stems (trunks) with lime and whale-oil soap. 3 Tree Peonies cost from one to two dollars each; of most nurserymen.

"T.," no address, asks whether it would not be well to bind grain with cord after it has been cut with the cradle, in view of the great use of cord binders now in connection with reapers, and the loss of time in binding the sheaves with straw bands.

ANS.—So far as our experience goes, and from what we can learn from others, there is nothing cheaper than straw for hand-binding. Twine at present costs from 20 to 35 cents per acre.

M. W. H., Roanoke, Ind., asks, 1, when is the best time to sow turnips; 2, what is the best kind.

ANS.—1 In Indiana all turnip seed, with the exception of Rutabaga, may be sown up to September 1. 2. The best turnips, such as White Egg, Red top Strap-leaf, Golden Ball, etc., do best sown about the middle of August. Rutabaga should be sown in the latter part of July to August 1.

J. H. G., Hart, Neb., is preparing ground for artichokes, but his neighbors say "Don't get 'em; they'll spread over the whole country," and he asks whether there is any danger of their doing so, and which is the best kind.

ANS.—The artichokes are hard to get rid of when once established, the root-stocks spreading out in every direction. That known as the Large Globe is preferred.

W. H., Van Wert, Ohio, asks why Potato Onions are rotting at this season, while in the bed—the bulbs are as large as hulled walnuts, and both the sets and the large ones are rotting alike.

ANS.—This passes our understanding. If we were on the spot and familiar with all the circumstances, we would, possibly, be able to fathom the mystery.

C. P. H., Evansville, Wis., asks whether there is any strawberry that doesn't have runners, but multiplies from the roots, and, if so, whether it is hardy.

ANS.—None that we know of, except the Bush Alpines. Mammoth Bush comes the nearest. After hot Summers the Alpines often fail.

Mrs. M. H., De Ruyter, N. Y.—They are as good as any. You should have sent your *full* name. Inquiries of that sort we prefer to answer by mail.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JULY 26.

W. F. B.—F. W. P.—T. T. L.—W. F.—H. H. C.—M. W. J.—B.—E. J. R.—E. W. B.—H. S.—P. H. B. A. B. A.—W. K. E.—L. H.—S. T. R.—D. L.—S. R. M., you should *try* our methods of corn culture on a small plot. THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, JULY 30, 1881

IN deference to many requests we shall defer, until the Fair Number, the publication of the names of those who take the wheat prizes. Engravings of the best heads will also appear in that number. Heads may therefore be sent so as to reach this office as late as August 20th—not later.

WE find that peaches of ordinary size and inferior quality were selling July 23, on Broadway, (N. Y.) at $1.50 per dozen.

OUR friends will have to hurry up their wheat specimens. Please be particular to write the name of the wheat on the outside of the box and give the name and address of the sender. Five heads are required.

THE Chicago Grain Receivers' Association has reduced the commission on the sale of flax-seed from two to one per cent. in store and one and a half per cent. on the railroad track. In view of the large increase in the cultivation of flax in the West, this reduction is as just as it decidedly is expedient. The larger amount of sales will reimburse the operators for the curtailment of their commissions, while had the higher rate been maintained, probably flax growers would have patronized a less exacting market.

A NEW GRADE OF WHEAT.—At a late meeting of the Grain Receivers' Association of Chicago, a resolution was introduced to request the Railroad and Warehouse Commissioners to establish a grade of No. 2 Southern red winter wheat covering all the No. 2 red winter wheat that may come from the States of Illinois, Indiana, Missouri, Kansas and Nebraska. It was urged that red winter wheat grown further north was not as good as that raised in the above area, the latter being intrinsically worth from five to ten cents per bushel more, and that grain inspectors could easily tell the difference between the two sorts. Very properly objection was made to depreciate sweepingly the more northern wheat by branding it geographically, and the resolution was amended so as to refer to the quality only irrespective of the place where the grain was raised. It is to be hoped that while this classification will raise the price of one grade, it will not lower that of the other.

THE GREAT ATLANTA SHOW.—The total number of entries for exhibition at the great Atlanta Exhibition down to July 18th, was 1,086, and their character shows the all-embracing nature of the exhibits, only two entries having been hitherto made of the same kind of articles. Among agricultural exhibits the most prominent hitherto are: cotton gins, cotton presses, cotton-seed cleaners, fertilizers, plows, harrows, cultivators, an agricultural steam engine and various food products. The buildings are being rapidly pushed to completion and Secretary Ryckman, now in this city, says they will be ready to receive exhibits by August 15, and that the Exhibition will certainly open on the date fixed—October 5. There is to be a large exhibit of foreign goods and two steamers are now under charter to leave Liverpool on August 15 for Savannah with articles for the show; while other exhibits will follow either on specially chartered vessels or by the regular lines. Now that the project of an international exhibition here has collapsed and the Boston Grand Show is likely to remain where it is now—in the clouds—let us turn all our attention to the making of this Southern show a grand success.

MISSISSIPPI GRAIN TRANSPORTATION.—Hitherto the great impediment to the development of grain transportation on the Mississippi River, for export *via* New Orleans, has been the apprehension that grain shipped by that route is likely to become heated. The recent experience in transporting grain from St. Paul and St. Louis to the Crescent City, however, have exploded this notion. Of 30,000 bushels of wheat lately shipped from St. Paul for Liverpool to be transshipped at New Orleans, the weigher at that point reports that the entire loss was only about 66½ bushels, of which only a bushel and a half was injured on the barges; whereas the loss from western points to this city is said to average nearly one per cent. To still further lessen any existing risk, a new system of ventilation has been introduced by the St. Louis and New Orleans Transportation Company. This consists of a funnel from the deck to the grain room and of openings above water on each side of the barge, through which air passes into and through a space between the hull and a lining to the storage department. A stiff current of air passes through the funnel and intermural space all the time, and it is said that a cargo of corn or wheat will keep fresh and dry all Summer on the water in barges ventilated in this way.

RIVER TRANSPORTATION seems to be about to have a good effect in cheapening freight rates by rail to the seaboard from all points on the Mississippi River, and consequently from all points west of it, from which there is water transportation to the Father of Waters or transportation by railroads terminating at the river, as at St. Paul and St. Louis. The great through lines from the trans-Missouri country will doubtless so arrange freight rates to their termini at Chicago and other points, that it would not pay to ship by them to the Mississippi freight to be transmitted on barges to New Orleans. Neither farmers nor speculators, however, should insist on reaping great immediate advantages from cheap river transportation, lest their unwise greed should check or defer its development. Arrangements were lately made at St. Louis to send five barges up the Missouri to Kansas City, the boats to start on telegraphic notice that the merchants of that place had their grain ready for shipment. On the announcement of the prospective arrival of the barges, however, the price of grain at Kansas City rose at the rate of two cents a day until it was higher there than at St. Louis, and the proposed trip of the barges was abandoned, and as they lost a good cargo to New Orleans while waiting orders for Kansas City, the proprietors are hardly likely to be anxious to renew the project.

SOFT WHEAT.

AMONG millers, especially in the Northwest, there is a growing agitation against soft wheat. A local paper reports that all the millers at Minneapolis lately refused to buy a load of Lost Nation because they had resolved to grind no wheat so soft. The flour from Minneapolis and other milling points in Minnesota has obtained its superior reputation principally because it is made of such very hard wheats as Fife. While this and other hard wheats will not yield so much per acre as soft varieties, mill-men can make a higher grade of flour from them by the "new process" and are therefore willing to pay a better figure for them. Quite a considerable number of mills in Western Wisconsin will not, it is said, buy Wisconsin wheat, because it is deemed too soft, preferring to send grain buyers into Minnesota for their supplies. Of late years farmers of the latter State have been tempted to grow soft wheats more extensively than formerly, and consequently the Minneapolis and other "high grade" mills in the Northwest have lately been buying heavily in Dakota where a new grade, "Hard No. 1," gives great satisfaction, while the soft grain is being shipped in bulk to the Eastern markets, mostly for export. It would seem that if the miller cannot ordain what sort of wheat the farmer shall grow in any other way, he will, wherever he can afford to do so, go so far as to refuse to buy soft wheat.

LOSS OF BEES LAST WINTER.

ANY process by which we may arrive at the causes of the great loss in bees during the past Winter, will be greeted with joy by the apiarist. The best way to ascertain what these causes are, is to consider the conditions as to location, kind of hive, protection, etc., under which the colonies were placed during the severe cold of Winter, and then make a comparison of the results as shown by the number and strength of the colonies that were alive in the Spring. In another column will be found statistics bearing on this question.

From these reports, received from all parts of the country, at least two important facts are evident—first, that it is profitable to carefully protect the hives in Winter, and, second, that frame hives are superior to all others for Winter use. The first fact is shown, as nearly as may be, from the summary that out of 268,313 unprotected colonies, 229,741 were lost; while of the 145,883 protected colonies but 67,238 succumbed to the cold. The second fact is shown by the statement that of 211,732 colonies in box hives, 187,705 were lost, and of 309,498 colonies in all frame hives, 142,307 were lost. That is, the average percentage of loss in hives is .89, and in frame hives but .46. It is probable that these figures are as nearly authentic as can be obtained, being derived from so large a number of reports and, being such, they are worthy of consideration.

IMMIGRATION AND THE PUBLIC LANDS.

THE total number of immigrants to this country during the year ending June 30 last, was 660,239, against 451,902 for the twelve months ending June 30, 1880—an increase of 208,337. This is the greatest tide of immigration that has ever flowed to these shores, and if each newcomer added only $500 to the wealth of the country, the aggregate would, in six years, overtop the national debt, if the rush continued equally large. A very large proportion of these are going West, many of them with the intention of "homesteading" so soon as they can legally do so. Besides a fair opportunity to win a livelihood or a fortune, the United States offers to every adult among them who "declares his intention" of becoming a citizen, 160 acres of unoccupied public land in any State or Territory possessed of land subject to entry, on condition of actual settlement—dwelling upon and cultivating the soil embraced in the entry. At the end of five years of continuous residence on, and improvement of, the land, he can receive a patent for it, though the final title will not be issued until full citizenship is obtained. The only payment for such a bountiful grant is a petty fee amounting to $34 on the Pacific Coast and to $24 in any other part of the country. Moreover, if the "locator" wishes to purchase his homestead outright, he can do so at the end of six months, paying for his land at the rate of $1.25 or $2.50 per acre, according to the provision of the law on the commutation of homesteads. The homestead act has been in operation 18 years, though much the same system of disposing of the public lands has existed for nearly 80 years, and up to the end of the last fiscal year—June 30—the United States has donated to immigrants and others 19,265,337 acres.

THE CATTLE COMMISSION.

THE Secretary of the Treasury has appointed a Cattle Commission whose duty it shall be to investigate all cases of pleuropneumonia in neat cattle, especially along the line dividing Canada from the U. S., and along the lines of transportation from all parts of the United States to ports from which cattle are exported, and to perform other duties prescribed by the Secretary with reference to this disease, in order that cattle shipped from this country to foreign ports may be known and certified to be free from this pest. The Commissioners are Dr. James Law, of Cornell University, N. Y. the standard veterinary authority of the country; Mr. James H. Sanders, of Chicago, Editor of the National Live-Stock Journal, who in the course of his editorial duties has obtained a great deal of information with regard to the plague; and Mr. D. F. Thayer, of West Newton, Mass., one of the best authorities in the land on contagious pleuropneumonia, who has been twice instrumental in stamping it out in Massachusetts. We have several times strongly urged a measure of this sort, although we would have preferred that the Commission should be connected with the Department of Agriculture rather than that of the Treasury, for we desire to add to the importance of the former, and this cannot be done if business that properly belongs to it, is performed by any other Department. The Commissioners are to meet on August 1, to form a plan of action, and it is to be hoped that no time will be lost in setting vigorously to work. The strongest objection hitherto urged in England by those who opposed any modification of the restrictions on the importation of cattle from this country, has been that no "clean bill of health" certified to the sound condition of the animals on their embarkation here; as the new Commissioners are to take measures to furnish certificates at the various ports at which cattle are shipped, it is to be hoped that our trans-Atlantic friends may either remove or greatly modify the present embargo on our cattle.

BREVITIES.

WE have to announce that our supply of Pyrethrum roseum seed is exhausted.

IT will be noticed that F. W. P., Texas, says, in our Everywhere Department, under date of July 16, that his Rural Branching Sorghum "is 10 feet high, with 19 branches to the hill"—that is, from a single seed. See, also, J. L. T's report from Virginia.

MR. GEO. W. CAMPBELL in his horticultural report of the Paris Exposition, speaks of a new plum called Merignon, which was to have been offered for sale in 1879. He says that it is of enormous size, nearly black in color, oval or egg-shaped, and as large as a hen's egg. It is, however, rather coarse in texture, and not above third-rate in quality. We presume some of our nurserymen have obtained trees and that it will be offered for sale in this country in due time.

A SHEEP DAIRY! Yes, indeed, one has just been started at Chattanooga, Tennessee. An Austrian, backed up by "men of means," has there begun the manufacture of Schafkase—sheep cheese—a delicacy which is said to far surpass "cow cheese" in all desirable qualities. Schafkase is made like ordinary cheese, it is reported, and the Chattanooga factory has started with milk from 200 sheep, which number is to be increased to 500 or even 1,000. Mutton and wool have hitherto been the chief points held in view in raising sheep, must their milking qualities also be taken into consideration?

THE famous cow Jersey Belle of Scituate, died the other day of milk fever, having dropped a bull calf the previous day. She was dropped July 10, 1871, got by Victor (3550) out of one of his own daughters, and was considered among the best Jersey cows in this or any other country—if she was not the very best. In her seven-year old season she gave 705 pounds of butter in 365 days—a yield that made her famous the world over. Some doubt of this performance has been insinuated by the skeptical, but while mourning her untimely death we have no heart to cast a shadow on her great merits.

FROM an English "blue-book" or Parliamentary report just published, it appears that during the year ending last February, the number of live stock shipped from this side of the Atlantic to Great Britain was 242,681. Of these 1,563 were washed overboard in rough weather, 156 died from exposure, 512 were suffocated, 63 died through lack of proper ventilation, 1,327 died from exhaustion, and 3,491 were thrown overboard during stormy weather for the safety of the vessel and the rest of the freight, making the total number lost 7,112. Although the loss is thus shown to be a trifle less than three per cent. of the total number shipped, yet what a world of suffering does it not represent, and what an opening for the exercise of humanity does it not afford to shippers!

BETWEEN Kansas and Colorado on the north and New Mexico, Texas and the Indian Territory on the South, lies an unexplored tract of public land about 160 miles long and about 30 miles broad, which is within the borders of no State or Territory and of which nothing whatever is known by the Government officials. At its last session Congress passed an act authorizing the Secretary of the Interior to have this tract surveyed, and Commissioner McFarland has just completed the necessary arrangements, so that this tract will soon be open to homestead and pre-emption settlement. It is believed to contain at least one large river with a dozen, or so, considerable branches. It is thought to be rocky and suitable for grazing, but not for tillage. There will soon be no corner in our wide territory whose capabilities and attractions have not been investigated and set forth.

AMONG the many novel projects discussed in England for the relief of land-owners one at least is about to be tested—in the form of an experiment in joint-stock agriculture. A company has been organized, embracing such prominent noblemen as the Duke of Buckingham and Lord Dacre, and skillful agriculturists like Mr. Stratton, the well-known cattle-breeder, with the object of leasing single farms or groups of farms in various counties and of cultivating them according to the very best principles. Ample means for doing so are at the command of the Company whose capital amounts to $5,000,000. Each group of farms will be under the management of some one whose skill and local experience will enable him to deal in the best way with that special land. Special attention will be bestowed on dairy farming, the rearing and feeding of cattle, sheep, pigs and poultry, market gardening and fruit culture. Special rates will be obtained, where possible, for transporting the products of each group of farms to market, and whenever practicable all products will be sold directly to consumers.

THE National Cotton Exchange convened at St. Louis, July 20 and 21, and appropriated $3,550 to defray the expenses of the year 1880-1881, and recommended that an assessment of $70 be made on each member. A meeting of one expert from each constituent Exchange, and of two delegates from New Orleans and New York are to meet in this city on August 15, for the purpose of establishing a uniformity of standard. A committee of three were appointed to memorialize Congress for an appropriation to establish stations throughout the South to furnish additional crop reports, and it was decided to ask local Exchanges to use their influence to secure the passage of such a measure. The time and place of the next convention are to be determined by the Executive Committee. It was urged that the Agricultural Department and Signal Service Bureau be extended and more liberally fostered, as both are capable of being made of great use to agriculture; while owing to the parsimony which now hampers their efforts, neither is able to do much good. The present method of collecting official crop reports was strongly reprobated, and, so far as cotton is concerned, it was declared that unless a change were made for the better, it would be advisable to discontinue the publication of the reports. A change is certainly desirable, but only a change—not an abolition.

Miscellaneous.

FILTERING CISTERN.

R. J. DODGE.

Our bread and meat are no more important for our well-being than the liquids we drink. The outlay for food is so constant that purchasing all the variety of which our solid nutriment is composed has with us become a second nature, but when we see water upon every side, and are often injured by the too plentiful torrents from above, we find it difficult to realize that there may at some time be a scarcity, and are not willing to bestow much labor in laying by a store of this luxury and necessity of every day and almost every hour. Experience, however, has taught us that, although the heavenly supply is generally bounteous, its fall is so irregular that, in general, provision in time of plenty must be made for coming times of scarcity, and wells and cisterns were hence needed and constructed by the most ancient of our race.

For many years my daily drink at Montclair, N. J., was rain water, fallen upon an ordinary tin roof, covered with some sort of metallic paint, said to contain no lead, and flowing into a large cemented brick cistern, whence it was pumped into the kitchen. This cistern differed from the usual construction in this manner: across the bottom, about three feet nearer one side than the other, was excavated a trough or ditch about two feet wide and two feet deep; along the center of this depression was built a brick wall from the bottom up to the top of the cistern and having a few openings left through it at the very bottom. The whole cistern, bottom, sides and canal included, was then cemented as usual, excepting the division wall. Upon each side of the wall, at its base, from six inches to a foot of charcoal were laid, and covered with well washed stones to a further hight of six inches, merely to keep the charcoal from floating. The rain water passing from the roof into the larger division of the cistern, passes through the stone covering, the charcoal, the wall, the charcoal upon the other side, lastly the stones, and is now ready for the pump placed in this smaller part. It is much better that the water at first pass into the larger division, as the filtration will be slower, and the cistern not so likely to overflow under a very heavy rainfall. I used this cistern for many years, and was troubled only once, when some toads made their entrance at the top, which was just at the surface of the ground, soon making their presence known by a decided change in the flavor of the water.

If your house chances to be in a dusty situation, several plans will suggest themselves whereby a few gallons at the first of each rain may be prevented from entering the cistern, but I employed no such means and never felt the need of any. Should the house be small, and therefore the supply of water from its roof be limited, do not lessen the size of the cistern, but rather increase it, for with one of less capacity some of the supply must occasionally be allowed to go to waste during a wet time, and you will suffer in a drought, whereas a cistern that never overflows is the more to be relied upon in a long season without rain.

Rain-fall varies exceedingly in different places, and even in the same situation it is impossible to foretell the amount to be expected during any short period of time, but the most careful observations show us that about four feet in depth descends at New York and vicinity every year, or nearly one inch a week. If this amount were to be furnished uniformly every week, the size of a cistern need only be sufficient to contain one week's supply, but we often have periods of four weeks without receiving the average of one, and we must build accordingly.

The weekly average of one inch equals one cubic foot upon every 12 feet of surface, or 3.630 cubic feet upon an acre, weighing about 113 tons. Upon a roof 40 by 40 feet, 1,600 square feet, it would be 133 cubic feet, 1,037 gallons, or about 26 barrels of 40 gallons each. A cistern eight feet across and ten feet deep would contain 502 cubic feet; and one of 10 feet across and 10 feet deep, 785 cubic feet or 6,120 gallons—about the average fall upon a roof of the above size for six weeks; while the smaller cistern would hold 3,900 gallons or a little less than four weeks' rain-fall. The weekly supply of 1,037 gallons, is equal to 148 gallons per day or nearly 15 gallons to each individual of a family of ten. This is certainly enough and more than enough, if used as it should be; but where water is plentiful it is wasted, and in our capricious climate, whether we depend upon wells or cisterns, it is wise to waste no water at all, at least during the warm Summer months, and lay by not for a wet but a dry day.

Experience in Carp Raising.

Last Summer I saw in a paper an article treating of the German carp, and for further information it said application should be made to Professor Baird, Fish Commissioner, Washington, D. C. I applied to him for fish and got 20 on November 19. In the mean while I had prepared a place for any I might get, by scooping out a pond of about 30 rods in a depression near a small creek, and dug a ditch from it to the creek, putting in four-inch tile to supply the pond with water and placing a screen at each end of the tile—one to prevent the ingress of refuse matter and the other to keep out the fish. When the pond was "full," the deepest part was four feet. When the fish arrived they were from two to four inches long; the largest I have seen lately are about ten inches long, and all appear to be doing well. I have been feeding them with hominy bought at the grocer's and have also given them some rice. From a large creek four miles away I brought a tubful of a sort of water weed and planted it around the margin of my pond, and I think the fish feed on it. Grass and various weeds are also growing in the shallow part of the pond. During the coming Fall I shall probably extend my pond so as to include two or three acres of hitherto nearly worthless land.

Preble, Ohio. W. M.

BOOKS, CATALOGUES, ETC.

Hand Book of Insect Collecting—W. P. Manton, Lee & Shepard.—This little book of 32 pages is well adapted "to furnish the beginner in the practical parts of entomology, with reliable information in a cheap form," as its prefatory note suggests. It gives instructions on the requisites for insect catching, how to prepare insects for the cabinet, time and places to hunt, etc., etc.

The Apiarian.

MID-SUMMER BEE NOTES.

The Strength of Colonies.

In case of scanty pasturage for bees at this season of the year, there is great necessity for providing them with food in the hive. The feeding should be done regularly after sunset, and as they are more liable to be vicious when the fields fail to supply them with honey, the bees should be smoked sufficiently to keep them quiet; and then, as always, they should be disturbed as little as possible. The practice of feeding, either in Spring before flowers bloom or in the Summer intervals during the absence of the best honey-producing flowers, is a wise one, as it keeps the bees in good condition for the work before them. Cheap honey is recommended by some as a good food, but "A" sugar reduced to the consistency of honey, is quite as good. There is but little to be said in favor of feeding grape-sugar and glucose.

The Moth Worm.

Honey which is removed from the hive in hot weather is apt to be inhabited by the moth worm, which hatches from the eggs deposited in one way or another by the bee-moth. Just how, or when, this is done is not known, but it is not at all unlikely that the moth finds her way into the hive and there lays her eggs, though some say she deposits them on the bottom boards of the hive and then they are carried inside by adhering to the feet and legs of the bees. If the honey taken out is to be kept in boxes during the Summer, it should be closely watched and at the first appearance of a fine, whitish powder on the combs, it should be removed by fumigating with sulphur. It is well to smoke combs from which the honey has been extracted.

Light and Dark Honey.

It is important to keep the light-colored, as basswood or clover honey, separate from the dark-colored, such as buckwheat honey. The apiarist who expects to get good prices for his honey will be careful not to let these two kinds go to market in the same box. White honey, though it be but soiled with dark, will not command as good a price. However, nice buckwheat honey, though not commanding as large prices, is yet a source of much profit, inasmuch as, in some sections, a good supply is obtained after the white honey plants have failed.

Ventilation and Shade.

Much attention should be given these subjects in hot weather especially. The brood nest needs to be well ventilated, but the boxes for wax-working should be closed. The hives should be protected from the intense heat of the sun during the heated term, though early and late in the season it is essential that the hives be exposed to the warm rays of the sun.

Italianizing.

August is a good month for Italianizing, as the queens can be obtained quite reasonably then, and good Italian workers will be ready for the next season. Every effort should now be made to build up the colonies with young bees, even if feeding is required. Colonies thus well prepared will stand the Winter much better. J. W. D.

Literary Miscellany.

"DOG LOST."

Oh who has seen my doggy dear—he of the stubby tail—
He of the soft and liquid eyes, and melancholy wail?
No more I hear his gentle step, nor see his happy face
When licking off his dinner-plate, or running on a race?

He was as ugly as they grow upon the Isle of Skye—
And that's what makes his loss so great, and made his price so high?
So tell me now, "ye winged winds that round my pathway roar,"
Will my dear doggy ne'er come back? Shall I ne'er see him more?

He was a brown and curly thing, who ran about the house,
And up and down the stairs he'd go, as still as any mouse;
I have never seen a dog so small, so horrible to see!
And will that darling, precious thing come never back to me?

Oh, no! he's gone! My heart will break! That terrier from Skye
Has left me for some other home! The tears fall from my eye.
Alas! If I should search the world, I know it could not be,
That I should find another dog as ugly as was he.

And so I mourn my doggy lost. Good people join my wail:
He was the dearest little dog that ever wagged a tail.
He *was* so ugly! Precious dear! So blest I cannot be
As ever to possess a dog as ugly as was he!

("*U-r-r-r-r-r-r-r, Ow, Ow, Ow!*")

But stay! What's that mellifluous sound that breaks upon my ear?
It is! Oh, can it then be true! It is his voice I hear!
And now, dull Time, bring all thy woes—I care not what they be—
Since my delightful ugly pet has been restored to me.

—St Nicholas.

THE MANOR HOUSE.

Can I find a lodging in the neighborhood?" I asked, hoping the person questioned would offer to put me in his own cottage.

"Not within a dozen miles."

"Could not you take me in yourself? Give me those two nice rooms over the porch."

"How do you know of them?" he asked, eyeing me suspiciously. "Anyhow, I can't, and that's all to be said."

"Well, how if I can get leave to live in the house itself, would the family object? They never come down you say, and the place is to let. I might write and ask the Squire."

"There ain't no Squire. It's Miss Judith as owns the place, and you can't write to her."

"Then I'll write to her lawyers, or the agent, if you'll give me his address."

An artist, a landscape painter, who has come unexpectedly upon "good stuff," to use the cant phrase, is not to be turned aside from his purpose by small difficulties. While wandering through counties in search of subjects for my brush, I had stumbled, quite by accident, upon Maxted Manor House, and I was resolved to make the most of my discovery. The place was a paradise for a painter—an ancient and embattled mansion, lying half hidden in a wooded dell, but moat-encircled and strongly entrenched with its stout sixteen-feet-thick walls. It stood four-square around an inner court-yard, in which grew one or two fine old ewe trees.

Guided by the caretaker, an illiterate, somewhat surly old man, who was also gardener, I had explored all that was in view within the Manor House. From him I had extracted, as though they were his favorite back teeth, a few particulars about the place. No one had lived in it for years. Why? The Maxteds were free to do as they pleased, surely? Now it was to be sold? "No, not to be sold. Why should Miss Judith part with the property? There had been Maxteds before the flood. Well, why not? it would only depend upon which flood; they had many floods in those parts. But Maxted could not be sold. It must go to some one of the same name—there were cousins always—if Miss Judith didn't marry; but that she was certain to do. A proper beauty she was—a pure Maxted, tall and fair and merry hearted, she is the living image of the picture over there," and he pointed to a large portrait of a lady in white, long, flowing robes, her face partially concealed by a gracefully draped veil, which gave greater effect to a pair of brilliant brown eyes. I was constrained to admit that if the present owner of Maxted Manor resembled the original of that picture she must be the possessor of at least one beautiful feature.

I had some difficulty in persuading the old gardener to give me the address of Miss Maxted's agents; he would only tell me that they were to be heard of in Blueburgh, the county town. I found them out at length, at Blueburgh, but they positively refused to forward my request to occupy the Manor House. Miss Maxted did not seek a tenant, they said, and would not be pleased with them for suggesting the idea. I asked them whether I could not apply in person, and was told that Miss Maxted did not choose to be disturbed by business affairs. I was not to be balked, however, and before I left the agents' office in Blueburgh, I had ascertained the name of Miss Maxted's lawyers in London. To them I wrote, reiterating my request, but giving no reasons; presently I received a civilly worded but very distinct refusal. Messrs. Burke and Bingham were instructed to say that Miss Maxted had no desire to let the Manor House, and that my application could not be entertained. I made one last effort, I wrote to an old aunt, who was much in the great world, and who knew everybody in it worth knowing. I asked her if she had ever met Miss Maxted, and if or whether she could further my views. She wrote back to say that of course she knew Judith Maxted. The girl was a near neighbor of hers in the country—an heiress and a beauty. Her fame was widespread; she was a most charming girl "In fact," said my aunt, "she would just do for you." As my aunt had already proposed some five-and-twenty girls as exactly cut out for me, I did not put much store by this, her latest suggestion. What was more to the purpose was that my aunt had made a point of seeing Miss Maxted, and had made her aware of my wish to pay a long visit to the Manor House. What followed I had better tell in my aunt's words: "Miss Maxted shook her head very positively. 'He had better not think of it,' she said. 'If you take an interest in your nephew, you had better dissuade him from his project.' I asked her to be more explicit. For a long time she hesitated and demurred. I asked her why she never lived in the house herself. 'I can't,' she answered, as I thought rather abruptly. 'That's nonsense,' said I, thinking she had some stupid scruples as a young unmarried woman; 'you are at liberty to live anywhere you please.' 'I can't live there, at any rate; *they* won't let me.' 'That's preposterous,' I went on, knowing she was quite independent, and, having no relations, would certainly not allow her agents or people to interfere with her. 'Who are *they?*' I asked. 'The ghosts,' she replied, quite as coolly as though *they* had been the rheumatism or smoking chimneys. "But after that, my dear Henry," wound up my aunt, "of course you will give up the idea."

Yet I had not the slightest intention of doing anything of the kind. If anything, this news made me all the more keen. My curiosity was piqued, my interest doubly aroused. Should I, a full-grown man, who had seen and done most things, be frightened out of my purpose by a silly story of a ghost? What if Maxted was reputed to be haunted? The ghost would hardly interfere with my sketching; and, if I succeeded in this, my sole object in visiting the place, I should not mind a little nightly disturbance. So I wrote back to my aunt in these terms, and begged her to assure Miss Maxted that all the ghosts in Christendom, or out of it, should not drive me from the Manor House if I had but the fair owner's permission to occupy it.

I think Miss Maxted must have been piqued in her turn by her reply. She did not seem pleased that I should make light of her family ghosts; she did not say so in so many words; but in finally yielding to my request, which she did with the best grace in the world, she accompanied her consent with one or two conditions which proved to me that she wished to make my tenantry as terrible as possible. She played, as it were, into the ghost's hands. In the first place, she stipulated that I should live in the house by myself, her ostensible excuse being that she did not like the notion of having strange and unknown people about the place. She could rely upon me, an artist, to have a reverent care for the furniture and contents of the house, which, although ancient and worn, were still precious as heirlooms and from their associations. Therefore, she left the house to me, and to me alone. Moreover, she hoped I should not want to bring any servants of my own. So far as my personal comfort was concerned, the the gardener and his wife would take every care of me. I might not mind a little roughing perhaps, but the old man had once been a page boy, and had some knowledge of valeting, and his wife was equal to cooking and caring for a single gentleman. If I agreed to these terms I might enter into occupation at once.

Of course I agreed. I did not mind roughing it; that was all in the way of business, and I had done it a dozen times already in far worse quarters than a snug country house, and, instead of a gardener and his wife, had often been contented to do without servants at all. Moreover, I seemed to see below these conditions a certain tone of irony and chaff, and I was determined that Miss Maxted should not terrify me out of my purpose by insisting on my facing the nameless terrors of Maxted Manor House alone.

Shall I confess honestly at once that I did not feel quite so courageous when I returned to the place?

It was not without a certain sense of trepidation—that peculiar feeling of gooseflesh which accompanies a shiver of terror—that I crossed the hanging bridge over the moat, and passed under the old arched gateway. The gardener unlocked and then swung back with difficulty the heavy iron-studded oaken outer door; a second presented itself, and opened into the central courtyard. High up on every side rose the straight, dark walls; windows were there in plenty, but all were closed with shutters, and reflected no light; above all, on one side, the tall belfry and clock-tower soared aloft, till its pinnacle seemed lost in the clouds. A grim, unearthly silence reigned around, which was mocked and soon conquered by the sounds made by our clattering feet upon the pavement of the courtyard. My impulse up to this point was to withdraw at once from my enterprise and return without delay to Blueburgh.

But now the old gardener had made good his entrance into the house. The moment he opened the door a flood of welcome light flashed out across the passage into the court. It came from one of the sitting rooms which had been prepared for me. The gardener's wife had kindled a blazing fire on the hearth; near it dinner was laid on a small oval table, and the fire-light danced pleasantly upon glass and cutlery and snowy cloth. Miss Maxted, as I afterwards heard, had desired that I should be made thoroughly comfortable, and under these instructions the best table linen and a portion of the family plate were brought out. From the kitchen, which was at no great distance, came a most savory smell, and assured me that at least I might count upon dining well.

I threw myself into a great high-backed chair before the fire, and immediately felt thoroughly at home. Meanwhile the gardener went to and

fro, bringing in all my belongings from without. When he had finished, he asked me if I should like to see my room, and went out to ask his wife in the kitchen in what room she had made my bed. I heard their conversation every word. The old lady was extremely deaf, and the gardener was obliged to shout very loudly to make her understand.

"In the state chamber, surely," she said. "Why not, you old image?" she went on. "It's the biggest and best of the beds—the downiest in the Manor House; you ought to know, for we slept in it—"

"Only once, dame, only once."

"Well, and whose fault was it that we did not use it oftener? Yours; gaffer. You pretend to be deaf when it don't suit you to hear. But that night you heard more than I did with your capers, for I slept through it all."

"I wouldn't sleep in that room again, not for worlds. You'd better change it. Come."

"I won't. I don't want to do my work over twice, just to fall in with your tantrums. Besides, Miss Judith said he was to have it—so there! The gentleman's not like you, afraid of his shadow; so g'long and show him up to his room."

I gathered much from these remarks: first, that there was some mystery about the state chamber; last, that Miss Maxted herself wished me to occupy it—probably out of mischievous desire to try my courage—and as this notion grew with me, I felt that I was bound not to draw back.

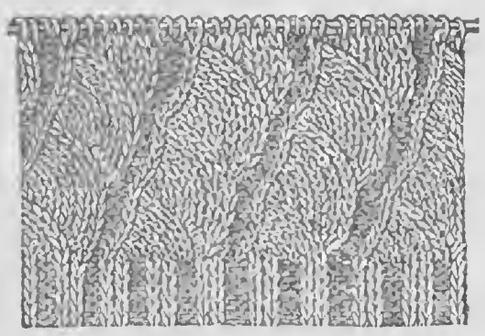

FIG. 364.

When the gardener returned and, holding a candle high overhead, led the way up stairs, we passed through those rooms *en suite* with that in which I was to dine—low snug rooms with ancient hangings and furniture, and each having two or three small windows looking upon the moat. On the other side, all the rooms had doors opening upon the corridor, and the windows of this corridor looked into the central court. The last room had a small door at the far end, up three steps, and I asked whither it led?

"To the tower staircase and so to the clock tower," said the old man carelessly; "it is locked and never used." With that we passed out into the corridor, and I found a flight of wide oak stairs leading to the first floor. Here there were rooms the counterpart of those below, and that which I was to occupy was exactly above my dining room. It was entered from the corridor and its windows also gave upon the moat. There was nothing very peculiar in my bed-room except that it had an old-fashioned air. The big bed was of dark old oak, richly carved; there was a press of the same wood; the wash-stand was of quaint shape, fitted with basin and jug and phials of some metal which, on closer inspection, I found to be silver; the floor was of dark oak; and the only carpet was a narrow rug by the bed and before the fire-place. This last was a wide, cavernous affair with large brass dogs, and on these crackled and sparkled a magnificent fire, which diffused warmth and comfort into every corner. A sweet smell pervaded the place as of new lavender and some antique perfume combined. If the ghosts loved this room they were luxurious ghosts, with a taste above brimstone and sulphur.

"I shall do very well here," I said cheerily to my conductor.

"So you ought; so you ought," he replied, but it was with an effort, as though he knew of reasons why I should not.

"There are a many more rooms," he went on, "if it happens you don't like this one. And you may not—you may not!" he went on with a dubious, mysterious shake of the head.

Half an hour later I was at dinner. Mrs. Duke gave me some very succulent soup, and a cunningly contrived stew, in which there were several kinds of game, rabbit, hare, partridge and a quantity of vegetables, shreds of cabbage, onions, carrots, broad beans and soft marrowfat peas. I had brought a case of wine with me, and after a glass I felt equal to face a whole legion of ghosts, if they wished to force their acquaintance upon me. But the evening slipped away most tranquilly; I sat and smoked, and read an odd volume and occasionally dozed. I was disturbed only by the visit of old Duke, who came about ten p. m. to ask me if I had any further commands, and at eleven I took my candlestick and went upstairs to bed. The state chamber well deserved its name, with its rich hangings, its dark, polished floor, which here and there reflected the fire-light, its gorgeous bed and general air of splendor, it was worthy to be the resting place of a prince.

Throwing another log or two on the fire, I prepared to retire to rest. There was a small table by the bedside, and on this, according to custom, I placed my candlestick and match box. I might want a light during the night. Last of all, I thought it advisable to lock and bolt my door. Ghosts, like love, may laugh at locks, but the latter are useful against living humanity; and, after all, I was alone in a strange deserted house.

I soon went to sleep. How long my slumbers lasted I could not say, but it seemed to me barely a short half hour before I was suddenly awakened by a most tremendous noise. I could not have been more startled, or have more suddenly regained all my faculties, if I had been drenched from head to foot by buckets of icy cold water.

To be continued.

For Women.

CONDUCTED BY MISS RAY CLARK.

DESCRIPTION OF CUTS.

FIG. 365.—LAMP-CYLINDER CLEANER.

It is made of soft, unbleached knitting-cotton. Make a chain of twenty stitches, join round, draw the thread through the first stitch, work six chain, and draw through both loops on the needle together; work to the end of the round.

FIG. 365.

The following rounds (twenty-two in number) are worked in the same way.

For the handle take a piece of cane 16 inches long, cover 10 inches of the cane with soft cotton-wool, and fasten it firmly on. The cover is drawn over the padding and tacked at the top, so that it may easily be taken off to wash when soiled. A chain of cotton is fastened through the handle to hang it up by.

FIG. 367.—CHINESE ANTIMACASSAR.

This novel antimacassar is composed of Japanese pictures, which are sold at most Japanese and fancy repositories, at a very low price. The pictures are each bound with olive-green sarsanet ribbon, and are seamed together at the edges like ordinary patch-work. One corner of each corner picture is cut off and the edge is bound. The border is composed of oblong pieces of cotton batiste, alternately olive-green and crimson; they are bound, joined together and fixed to the center.

FIGS. 364 AND 366.—CHILD'S STOCKING: KNITTING.

THIS stocking is suitable to be made in knitting-cotton (No. 16) and pins (No. 18) or knitting-silk and the same size pins. Fifteen stitches are cast on, and twenty rounds knitted for the inch. As the stocking may be made for a child of any size, we think these directions will be more useful than if we gave any stated number of stitches. We may, however, mention that for a stocking to fit a child from four to five years of age knitted with the pins and silk or cotton described, about 111 stitches should be cast on. The number of stitches cast on must be divisible by

FIG. 366.

ten, as that number is required to form each pattern. Eleven extra stitches are allowed, which must be knitted plain in the middle of the back of leg, so that the requisite decrease may not throw the pattern out.

For the top of stocking: Commence with the ribbed pattern, knit two and purl two alternately for about forty rounds, or two inches. After this the pattern Fig. 364 is commenced.

1st Round: Purl two, make one by turning the cotton over the pin, knit seven, pass the next stitch over the seventh knitted stitch. Repeat from the beginning of the round until you are within eleven stitches of the end; these are knitted plain. The center stitch of the eleven must be purled in every round for the seam. In order to remember to do this, tie a piece of colored cotton in the stitch in the first round. As these stitches in nowise form the pattern, we shall not mention them in the following directions.

2nd. Round: Purl two, knit one, make one, knit six, pass the next stitch over the sixth knitted stitch, and repeat from the beginning of the round.

3rd. Round: Purl two, knit two, make one, knit five, pass the next stitch over the fifth knitted one, and repeat from the beginning of the round.

4th Round: Purl two, knit three, make one, knit four, pass the next stitch over the fourth knitted stitch, and repeat from the beginning of the round.

5th. Round: Purl two, knit four, make one, knit three, pass the next stitch over the third knitted stitch, and repeat from the beginning of the round.

6th Round; Purl two, knit five, make one, knit two, pass the next stitch over the second knitted stitch, and repeat from the beginning of the round.

7th. Round: Purl two, knit six, make one, knit one, pass the next stitch over it, and repeat from the beginning of the round.

Repeat from the first round.

The decrease is commenced when you have made the leg the length required from above the knee to the center of the calf of the leg. To decrease, knit two together before and after the seam-stitch in every sixth round until you are within two inches of the commencement of the heel. These two inches are knit two and purl two every round.

For the heel, divide the stitches, leaving the same number on one pin for the heel as there are on the two other pins for the front of foot, knit and purl a row alternately until you have worked

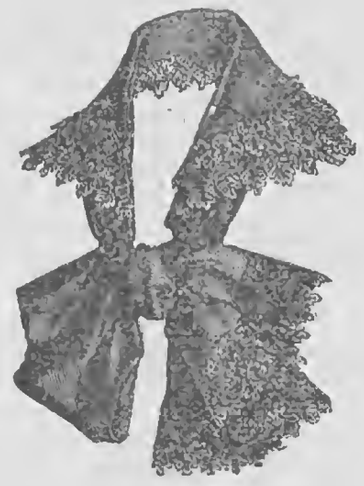

FIG. 368

the length required for the heel. The seam-stitch must be purled in the knitted row, and knitted in the purled row. For the gusset, begin with the knitted row, slip the stitch next after the seam-stitch, knit the second, pass the slipped stitch over, and knit the next, turn back, purl to the other side of the seam, purl two together, purl one, turn back. In the next row, slip the second stitch past the seam, knit the next, pass the slipped stitch over, knit one, turn back; continue in this way until you have taken in all the stitches each side the seam. Having finished the heel, pick up the stitches at the edge, beginning at the left side, with the pin on which the heel-stitches are, knitting each stitch as you pick it up. With another pin work off the stitches on the two front pins, then with another pin pick up the stitches on the right side of the heel; work half the gusset-stitches on to this pin. Now commence the gusset of the foot; knit around to the right-hand side of the back of foot, knit the first stitch, slip the second, knit the third, pass the slipped stitch over the knitted one, knit to within three stitches of the end of the next pin; slip one, knit one, pass the slipped stitch over, knit the last, the front pin is always knitted without decrease; knit one plain round between every decrease. Continue to knit without increase or decrease until the foot is within an inch of the length required; then decrease for the toe. Knit the first stitch of the front pin,

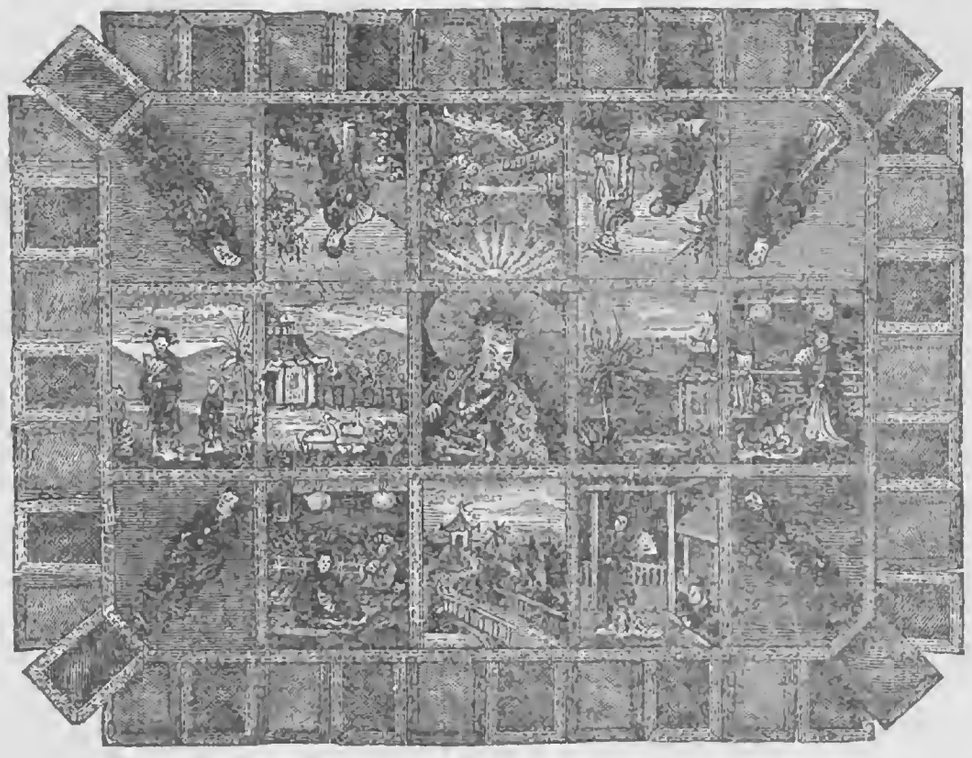

FIG. 367.

slip the second, knit the third, pass the slipped stitch over, knit to within three stitches of the end of the pin, slip one, knit one, pass the slipped stitch over, knit one, decrease in the same way at the beginning of the next pin and at the end of the last pin. Work one plain row between each decrease, until you have ten stitches on the front pin and five on each of the back pins; take the stitches from the last pin on the second, place the front and back pins together, and cast the front and back rows off at the same time.

FIG. 368.—COLLAR AND CRAVAT.

The collar and cravat are of blue satin and white lace.

FIG. 369.—FICHU.

The fichu is of cream-colored surah and lace.

HOW TO DRESS WELL AND ECONOMICALLY.

BY MARY E. BURROUGHS.

How not to look slovenly at home or shabby abroad is a problem which—to those of moderate and often very limited means—seems almost incapable of solution. In this, as in all good work, there must be a definite plan of procedure. You must decide in the first place, how much money you can afford to spend each half year on dress.

FIG. 369.

Very few women know how much it has cost them to dress heretofore; they spent just as it seemed convenient and perhaps found when three-quarters of their Spring wardrobe was provided, that all their money was gone, and they were obliged to go the rest of the Summer only three-fourths well dressed and consequently dissatisfied. You cannot decide how much you can afford unless you have at some time kept an accurate account of your expenditures for this purpose and thus know how much you have afforded before. When once you know somewhat definitely the amount of money at your disposal the next step is to find out for what occasions you are to provide dresses, these are usually comprised in the following enumeration: parties, church, visiting, shopping, calling, etc., and home.

Of party dresses little need be said since many of my readers probably could not afford it, even if they had occasion for an elaborate evening costume. As a general rule it may be said, however, that while dresses with natural flowers or ribbon trimmings are always suitable for young ladies and need not be either expensive or elaborate when made of the materials now so much in vogue: dotted muslins, lawns, bunting, nun's veiling, etc. Such dresses can also be worn to church and elsewhere in hot weather.

For church nothing is so appropriate as black in cassimere, grenadine or silk materials. But a black dress must never be of cheap quality; therefore, unless you can afford a fine quality, do not get one. A dark blue, brown or gray woolen dress, plainly and tastefully made is much more ladylike than a cheap black silk or cassimere. For church then, any dark materials, whether silk or woolen are admissible and suitable, although almost everything is worn.

For visiting, shopping, etc., woolen dresses are most used, and for home wear in the afternoon; these need not necessarily be of very dark shades but should always be *inconspicuous* in color. In fact, this is one of the essentials in the solution of my problem. At present, the most serviceable dress one can have is a soft flannel suiting which costs 50 cents per yard, single fold. It is usually medium brown or gray, or very dark blue in color, and is made with no trimming except a few rows—three or five—of machine stitching. It may be made round waist, with belt and trimmed skirt or plain basque and trimmed skirt.

For home wear, if you do not do your own housework, such a dress as the one described above is appropriate; if you do, two gingham dresses which may be washed alternately are necessary. And I wish here to recommend gingham over calico; though slightly more expensive at first, it does not crumple or soil so readily and both wears and washes better. Make them simply; if you do not like the wrapper style, make the skirt short with one plain flounce and the waist either a long gored half-fitting sack or a round waist and belt. Such dresses are easily laundried and need never be made over.

Now, about making over; do not do much of it; it does not pay; you will find it a far greater saving of time and strength no less than of money, to have fewer and plainer dresses and to wear them out as you go. This rule does not always apply to children's clothing. The great mistake which women make who have not time and money to follow the fashion but who do not wish to look "dowdy," is in fancying they must have so many changes. Do not be afraid of wearing one dress almost everywhere you go until it is worn out. People notice it far less than you imagine.

It is most economical to wear somewhat the same color all the time; then whatever you may have on hand in the way of bonnet trimmings, gloves, etc., will always match what you buy new.

It is now considered not only sensible but extremely fashionable to have all dresses short.

If I have helped even one to the solution of this

much vexed question of dress, I shall be satisfied. At another time I will give some hints on the accessories of dress which are almost more important than the dress itself.

ABOUT BOOKS.

MOSS DALE.

LYING around here and there in our house we find much reading which hardly deserves the name of books—magazines, papers, such as the RURAL, and often numbers of the Franklin Square and other libraries—which, if only in some style of binding, would make a nice little library. Such publications, being cheap, are often bought, but by careless handling and by the aid of borrowers they disappear very quickly.

Many of the best works in the English language can now be obtained at very slight cost, and as I had gathered together a number of them that I wished to keep for future reading, I lately bound them after my own fashion, and as it was quite a success, I will give the method:—

Take numbers of like size and shape for one book; if they are numbers of a periodical, arrange them in the order of their dates. Now touch the back edges of them with a little paste, not allowing the paste to extend more than one-eighth of an inch on the margin; pile them very squarely on each other, place a board and weight on them and let them remain for some hours, or even over night. The paste is only to keep them in place while being sewed. Next procure some very stout cotton cloth and cut two pieces just the length of the back of your book and of sufficient width to cross the back of the book and extend three-quarters of an inch on each side; lay this on the back of your book and sew it through and through firmly from top to bottom. For sewing mine I used a stout needle, some fine white carpet warp and a small awl to make the holes. The sewing should be about a quarter of an inch from the back of the book. You are now ready for the covers, which should be made of stout card-board slightly larger than the pages of the book, and fastened with paste between the pieces of cotton cloth on each side. White paper may now be pasted in as a lining to the covers and a cover of the magazine or other suitable paper fastened on the outside. Then finish the whole with a strip of black cambric down the back. In putting on these use as little paste as will serve, as it has a tendency to soften the card-board. After finishing, let the book lie under a weight till dry.

Nicely-bound books should be provided with a paper cover while being read; works of reference or others in constant use should be covered permanently. School books should be covered with calico or gingham, and slate frames with flannel or some other soft substance to prevent noise in the school room.

Impress upon the children, both by precept and example, that good books are treasures, and as such should receive careful handling. *Provide good reading matter* for yourself and family with a bounteous hand, and then take the best of care of it.

CORRESPONDENT'S CORNER.

CAUTION.—In RURAL of July 2, in list of books recommended to "Improvement" in my paper "Concerning Correspondents' Questions," for "*Seeky's* Intellectual and Moral Histories of Europe," read *Lecky's* Intellectual and Moral Histories. M. W. FISHER.

PLEASE tell a RURAL reader how to clean kid gloves. A. N. F.

ANS.—Get naptha or purified benzine and wash them by rubbing as you would a handkerchief or other article; wring and draw out smoothly, then hang up to dry in the sun, if possible. The unpleasant odor is removed sooner by contact with the sun and air.

This is more effectual than rubbing the gloves with a saturated cloth.

WISHING to do some decorative work in the way of ornamentation for colored scent bottles, cushions, etc., and not being possessed of sufficient artistic talent to paint designs, I would esteem it a favor to be informed of some other means than that of pasting paper pictures upon them.

C. A. E.

ANS.—Mineral decalcomanie designs in varied representations will no doubt meet your wants; they are the best substitute we know of.

Pressing with a hot iron is the manner of transfer.

How shall I prevent my bonnet—a light one—from being injured by the hair? The usual lining does not keep it clean. K. E. G.

ANS.—Baste a piece of oiled silk between the lining and bonnet, extending it well up in the crown and as far below the rim as the style will allow without exposing to view. The oil from the hair will not penetrate this.

BAD WORDS IN CHILDREN.

THE pain that mothers feel when, as a late correspondent of the RURAL expresses it, "one of the children says a bad word," is something that every good parent can appreciate. But do we always have faith enough in "a good bringing up?" A sound, healthy child would go unharmed through the measles or whooping cough, and do they not also go through and throw off these little undesirable habits which all children will catch up either behind your back or before your eyes? Mind and body are alike in that they have a self-righting power of their own that we cannot understand. Sow the good seed and have faith in your work.

Obstructions of the kidneys and attendant organs will prove fatal if not removed by Hop Bitters.—*Adv.*

BRIC-A-BRAC.

THE SMOKER'S CONFESSION.

There's not a pipe, I ween,
Like the stumpy, black dhudeen
That all of us have seen
In Paddy's hatband, O.
For it makes his thought take flight,
And it fills him with delight,
As it gives him second sight
Of far-off Patland, O.

I have read in Eastern books
How the Turks will smoke chibouques,
As grand and grave as dukes,
In seraglio.
That ye'd rather take a pull
At Paddy's pipe when full
Than lounge in old Stamboul,
I'll go bail ye, O.

HOW TO VISIT.

If you call at a friend's house Sunday evening and they are polite enough to invite you to call again, trot up Monday, saunter up Tuesday, drop in Wednesday, make a short call Thursday, step in Friday, spend the evening Saturday and repeat the dose the following week. Of course they'll become attached to you and after a time you can call twice a day. They may pray that you'll fall off the steps and break your neck, or that a bolt of lightning may strike you as you ring the door-bell, but that makes no difference to you so long as you can escape such deserved calamities. They won't dare to shoot you or set the dog on you, because that wouldn't be polite. Go it while you can, because after a certain time a suffering people will become desperate and give you the cold shoulder.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

THE DIET OF MOTHERS.

MOTHERS who nurse their children should bear in mind that what they eat at such a time is of great importance, both to themselves and to the children. The very best article of food that they can avail themselves of, is oat-meal mush or gruel, which is always delicious when properly cooked. The oat-meal furnishes the earthy phosphates and other materials out of which good milk is made, so that the mother's own structures are not drawn upon, and her teeth are saved from decay. M. W. F.

JELLIES.

As it is the season of the year for laying in a store of jellies a few hints from an old housekeeper may be acceptable to young housewives.

Crab apples make a very fine jelly; wash them in pure water, cut out all specks and put them in a large porcelain kettle. Six quarts of apples will need a gallon of water. Let them boil slowly till the apples will mash easily with a spoon; then press them through a sieve, and put the liquid back into the kettle. Let the liquor boil away half, then strain through a jelly-bag. To two cups of the juice, add one cup of granulated sugar, boil about fifteen minutes, remove from the fire and when cool dip into the cans or jelly glasses. This makes a very bright, tart jelly, that is very nice for table use. Common sour apples, make a good jelly only they will not make as pretty a color and the jelly will be more acid. The old rule for jelly was a pound of sugar to a pound of juice but it is much better to use less sugar as the jelly is then more acid and is not so liable to candy. The jell from grapes is of a very dark color, and pleasant flavor. Put the grapes into a stone jar, and cover it tightly; set the jar into a kettle of boiling water, and let them scald till the grapes burst; strain through a jelly bag and then add one-third of the quantity of sugar that there is of juice, and boil till it begins to thicken; you can test it, by taking a spoonful into a saucer for trial. All kinds of jelly need to be skimmed while boiling, so that they will be perfectly pure. Rhubarb jelly is very good when one cannot obtain apples, and is made the same as crab apple jelly. A lemon sliced and boiled with it gives a very nice flavor. It is boiled in the sirup after the rhubarb is strained out. FARMERS' WIFE.

DOMESTIC RECIPES.

Long Cake.

When making bread into loaves, set aside a mass of dough till, say, one hour before the next meal. Then knead it a little, roll it into cakes a half inch thick, and bake on a griddle on both sides. This will be far better and more wholesome than any kind of soda cakes ever made, and a surprise to those who never ate of them. To be eaten hot.

Bannocks.

Into one pint of Indian meal stir one pint of buttermilk, one-half teaspoonful of salt, one teaspoonful of molasses, one of butter, and add two well beaten eggs and a pint of wheat flour. Thin with milk to a thin batter; last, stir in two large teaspoonfuls of soda dissolved in hot water. Pour into buttered shallow pans and bake an hour in a quick oven, which bakes top and bottom brown. Excellent.

Corn-Starch Cake.

Two cups of sugar, one of butter, one of sour milk having in it one-half spoonful of soda, one spoonful of extract lemon, one cup of corn-starch. Mix well. Then beat up six eggs; add them; mix in quickly two cups of flour having one spoonful of cream-of-tartar in it. Bake in a quick oven.

Angels' Food (O 'Eavens!).

Slice oranges, and sugar them down, then cover with finely-grated cocoanut. Let stand ten hours and serve as dessert, or for afternoon tea.

Cocoanut Custard.

Grate the cocoa, mix with milk, boil five minutes. To one pound of this add one quart of milk, eight eggs, four tablespoonfuls of white sugar, one glass of wine, two tablespoonfuls of melted butter, one-half a nutmeg, grated. Beat the eggs, sugar, butter and nutmeg well; then add the wine. Put this into the milk and cocoa when cold. Fill the custard shells and bake.

Cocoanut Cake.

Whites of ten eggs, whipped; two cocoanuts, grated; one pound of powdered sugar; one-half pound of sifted flour. Beat well together; add a little rose-water; pour into pans and bake three-quarters of an hour.

Cherry Pudding.

Beat eight eggs, add, gradually, one and one-half pound of flour, one and one-half quart of milk, a little salt. Set it in the oven, bake 15 minutes; stir in the cherries, then bake till done. Serve with any sweet sauce.

Tomato Fritters.

Slice ripe ones, dip in a thick, rich batter; season with pepper and salt; fry like oysters. Or, they may be seasoned with sugar and almost any spice, and fried as before.

Biscuit.

Sift two teaspoonfuls of cream-of-tartar and one of soda into one quart of flour; work in one cup of butter and a little salt. Mix all with a large pint of water; knead briskly, bake quickly.

Tomato Catsup—A Secret Disclosed.

Boil one-half bushel of tomatoes three hours; strain out the skins and seeds; to the remainder add three pints of vinegar, one-half pound of salt, one-fourth pound of black pepper, one ounce of Cayenne pepper, one-fourth pound of allspice, one ounce of ground cloves, two pounds of brown sugar. Boil one hour. I have never seen any catsup to equal this, and have kept the above secret for 35 years till now. CHIEF COOK.

Elderberry Brandy.

Gather only the berries that are perfectly ripe. Pick from the stems, and to six quarts of fruit add two quarts of water. Put into a porcelain kettle and boil 20 minutes. Then strain, pressing out all the juice. Add another quart of water, half an ounce of whole cloves, allspice, cinnamon and ginger root. Return to kettle, boil gently three hours, and, just before taking from the fire, stir in three pounds of loaf sugar. When dissolved let cool, then strain through a flannel bag. When cold add a quart of good brandy. This will keep for years if bottled and corked, and is an excellent medicine for the bowels.

Chickens for Luncheon.

Split down the back, then through the breast—wash and wipe dry. Sprinkle with salt and pepper, put into a dripping-pan with two or three spoonfuls of butter and place into a well-heated oven. Baste frequently. Bake until cooked through and nicely browned. Serve cold. Garnish with parsley.

Chicken Pudding.

One full-grown chicken—let it be a young one. Cut into small pieces, put in a stew-pan with a little water, season with salt and pepper, and boil until it begins to grow tender. Take the pieces out and lay into a three or four-quart pudding dish. Have a quart of green corn cut and scraped from the cob, add to it three beaten eggs, a pint of rich milk and salt and pepper to taste. Pour this over the chicken, dredge thickly with flour, lay on bits of butter, and bake 30 to 45 minutes.

Corn for Winter Use.

Throw the ears into boiling water and let remain just long enough to set the milk; then cut carefully from the cob and to every two quarts of corn add a pint of salt; mix thoroughly, pack in earthen jars, spread a cloth over the corn with a weight on top. Keep in a cool place. When wanted for use put into a stew pan, cover with cold water, let heat, turn off, put on cold water again and so repeat 'till fresh enough for taste. Cream, butter, salt and pepper may then be added.

Green Corn Pudding.

Draw a sharp knife through each row of corn, lengthwise and scrape out the pulp. To a generous pint of this pulp add three beaten eggs, a teaspoonful of butter, sugar to taste, a little salt and any spice or flavoring liked. Bake in a moderate oven two hours. Stir the pudding occasionally at first until it thickens.

Drying Corn.

Be careful to select ears not too old. The success of your corn depends upon this. Carefully remove the husks and silk so that it will not be necessary to wash the corn. Cut and scrape from the cob—not too close—and when you have cut off three or four quarts spread upon *earthen* dishes and put at once into a moderate oven for 20 minutes, stirring frequently. Then set a table out in the sun, cover with a cloth, spread the corn on it evenly and thinly. Bring into the house before the dew falls and spread out. The next morning heat as before and put out in the sun. If care has been taken, the corn will now be dry enough to put away. If not dry, heat and put in sun another day. Tie up in paper bags.

Corn Fritters.

One quart of grated corn, three eggs, the yelks and whites beaten separately, two crackers, salt and pepper. Beat thoroughly. Have ready in a skillet butter and beef drippings in equal proportions. It should be hot, but not burning. Drop the mixture by the teaspoonful into the hot fat and brown upon both sides. Be very watchful lest they burn. The whites of the egg should be beaten stiff and lightly stirred in just before frying. A. B.

"Homes in Texas"
IS THE TITLE OF
A New Illustrated Pamphlet.

Descriptive of the country along and tributary to the line of the
INTERNATIONAL & GREAT NORTHERN R. R.
and contains a good COUNTY MAP of the STATE. It also contains the names and addresses of Farmers and Planters in Texas who have

Farms for Sale or Rent,

and those who will want FARM HANDS for this year. A copy of this book will be mailed free to those who desire reliable information about Texas, upon application by letter or postal card to
ALLEN McCOY,
Gen'l Freight & Pass'r Agt. Palestine, Tex.

FOR HOMES & REALTIES IN VIRGINIA
WRITE TO
BUREAU OF IMMIGRATION,
RICHMOND, VA.

REAL ESTATE of every kind, town and country, in the Valley of Virginia. Correspondence solicited. Send per postal card for pamphlet catalogue. TIMBERLAKE, STICKNEY & GUYER, Real Estate Agents, Middletown, Frederick Co., Virginia.

News of the Week.

HOME NEWS.

MONDAY, July 25, 1881.

The President's condition on Saturday, the 23d inst., was for a time somewhat precarious. Fever set in, and pain was somewhat increased. Dr. Agnew has performed a surgical operation on the President to open a sack of pus which had formed near the wound. The incision was made about three inches below the wound and at a depth of two inches and a half. There the abscess was found which had caused the recent relapse. It is thought that if no other abscesses exist, he will recover from this relapse in a few days. The President is weak being unable to lift his arms or his legs, yet he has great vitality and keeps up good courage. The latest reports this morning state that the President's condition is improving, and is as good as can be expected so soon after the relapse.

On Friday the 23d, the election of Elbridge G. Lapham, to succeed Conkling in the U. S. Senate closed the long and bitter struggle at Albany. A conference was held by the republicans in which both factions participated, and the form of electing a candidate was gone through with. Mr. Lapham received 61 votes, and Mr. Conkling 27. Then, when the 56th ballot was taken, Mr. Lapham received 92 votes and Mr. Potter (dem.) 42, and the work was done. Mr. Miller of Herkimer, it will be remembered, was elected to succeed Platt, on the 16th inst.

The widow of the late Rev. E. H. Chapin, D.D., died suddenly at her summer residence, at Pigeon Cove, Mass., on the 22nd inst., of heart disease.

The little town of Red Bank, N. J., was visited by fire on the 18th inst., which destroyed about $75,000 worth of property. Help was rendered by fire companies from Long Branch. One fireman was killed.

During June last there arrived via San Francisco, from foreign ports, 4,110 persons—the largest number for any month during the past five years. The greater part of these immigrants are Chinese. The arrivals of through passengers overland at San Francisco numbered 4,415. This is some 1,200 more than for the corresponding month in the previous two years.

There is so great a demand for labor at Castle Garden that it cannot be supplied, even with the enormous immigration. There are now on the books 1,000 orders for male labor, and nearly 500 orders for household servants. The demand for laborers by railroads is very large, and numerous applications come from the South for mill and agricultural hands.

A monument to the confederate dead was unveiled at Culpepper, Va., on the 21st.

Sitting Bull and about 200 of his followers surrendered on the 19th inst. to Major Brotherton, at Fort Buford, D. T. They were nearly starved, it is said.

Gen. McPherson's monument was unveiled at Clyde, Ohio, on the 22nd inst., in the presence of about 20,000 people. Prominent gentlemen and officers of the army were present. Ex-President Hayes presided. The procession was over two miles long.

A fund of $10,000 to be known as the "Diman Memorial Fund," in memory of the late Professor Diman of Brown University, is about to be established. The income of the fund will be devoted to purchasing historical works for the "Diman Memorial Alcove" of the new library.

A lucky blacksmith at Titusville, Pa., has "struck oil" in reality. While at work, one day, in his garden with his spade, he noticed little pools of crude petroleum forming in the cavities he had made in the ground. He dug a pit four feet deep, and took therefrom five barrels of oil which proved to be excellent, and which sold at a neighboring oil refinery for $1.10. Immediately a great demand for leases of adjoining territory arose and numerous wells are being dug, and the oil is flowing freely. The blacksmith's garden is yielding 100 barrels a day, and he is making $100 per diem, with encouraging prospects.

The board of alderman of Virginia have passed a resolution, inviting Pres. Garfield and his cabinet to visit the Yorktown centennial, and appropriated $5,000 for their entertainment and that of visitors from France. The same body passed a resolution appropriating $15,000 to the centennial. This is the first step taken by any municipal or state authority to give substantial aid to the enterprise.

The Welting Opera House building at Syracuse N.Y., in the center of the city containing one of the handsomest opera houses in the state burned on the morning of the 19th. It was wholly destroyed and it was the most disastrous fire in Syracuse for thirty years, involving a loss of over $300,000. Fifty tenements occupied the block which was four stories high. Half a dozen persons were injured by falling walls and one or two persons perished.

Carrier pigeons last Sunday morning conveyed to Tom's River, N. J., before eleven o'clock, a summary of the most important news published in the city papers here. These fleet winged aerial messengers may yet play an important part in the distribution of information to points not quickly attainable by post or telegraph.

The Hon. Levi P. Morton, United States Minister to France, started for his new post of duty on the 10th in the steamship Amerique, of the French line.

A monument to the memory of the Union dead of Michigan has just been completed in Detroit by the addition of four statues representing History, Emancipation, Victory and Union.

At a meeting of the New Capitol Commissioners at Albany, the contract with the Hallowell Granite Company was rescinded, and the Superintendent was ordered to advertise for proposals for furnishing granite for the completion of the building. It is thought that by this action $50,000 or $60,000 will be saved to the State.

One of the most violent thunder-storms ever known in Massachusetts occurred on the 21st. The storm was accompanied by a terrific shower of hailstones ranging from half an inch to one and one-half inches in diameter, which did a great deal of damage. Hundreds of dollars' worth of glass was broken, nearly all the manufactories suffering more or less damage. Reports from the surrounding agricultural towns indicate an immense amount of damage to the crops.

A curious coincidence is found in the fact that the nurse who attended the President at the time of his birth died about the hour the assassin attempted his life. Her name was Mrs. Stewart C. Gardner, and she died at the residence of her son, A. J. Gardner, in Mason Township, near Dowagiac, Mich., at the age of 87 years.

Twenty-five tenement houses, two saw mills, the depot stores, boarding houses and stables in Wallace, Mich., were burned on Wednesday; also, the year's stock of logs, a large lot of piled lumber, and thousands of ties, posts and telegraph poles. Mr. Mellon Smith was the owner of nearly all of this property, and his loss will not fall short of $75,000; insured for $9,500. One school house and two small tenement houses are all that are now left of this recently thrifty burgh.

The drains leading from the Philadelphia Mint yielded about $1,000 worth of gold and silver at the last annual scouring. The recovery of metal by that operation has amounted to $21,000 in nineteen years.

Martin Murphy, of Santa Clara, Cal., one of the original settlers of California, celebrated his golden wedding Tuesday. One ox, 12 sheep and 12 hogs were roasted whole for the villagers, and a car-load of ale and wine were drank by them.

A scrap book is being prepared to contain editorials, public expressions, etc., regarding the attack on the President's life. It will be an immense volume. All telegrams of sympathy are to be preserved. All dispatches from abroad are to be kept in the records of the State Department.

One of the census reports says that for the last ten years the national debt has been paid off at the rate of $160,000 a day.

At one time last Winter the Chicago and Northwestern Railroad had 4,000 men at work shoveling snow, and the St. Paul 3,000 men, at $1.50 a day and board. The Illinois Central had also at one time several thousand men employed at this work. The total cost to the Western railroads by the snow blockade was not less than $2,000,000.

The Secretary of the Navy issued an order, Tuesday, directing that the work of repairing the United States steamer Tallapoosa, the dispatch vessel of the navy on the Atlantic coast, now at the Washington Navy Yard, should be prosecuted with all possible haste, so that the vessel may be ready for sea by the 12th of August. The Tallapoosa has been undergoing extensive repairs for some months and in the ordinary course of work would be ready for sea service about the first of September next. Anticipating the recovery of the President, who is very anxious for a sea voyage, the Secretary of the Navy desires to have the Tallapoosa ready for that purpose.

Connecticut had a young cyclone last week that ruined crops, unroofed houses and killed stock. A load of hay was blown on to a yoke of oxen at Hartford, and while the owner was trying to cut them loose with an ax he killed them both. At Berlin and Meriden the storm did great damage.

It is said that $29,000 has been subscribed of the $35,000 needed to establish the Daniel Webster Professorship of Latin in Dartmouth College.

The Postmaster General commands a much larger force than our combined army and navy. It numbers 65,000 in all.

In the next election in Colorado the location of the State Capital is to be an issue. Denver, Pueblo and Colorado Springs are the principal contestants for the honor.

Friday week a company of highwaymen led, it is believed, by one or more of the notorious James brothers, boarded and robbed a train of the Rock Island Railway, killing the conductor and one passenger, and badly frightening the rest, but robbing the express safe of less than $2,000.

This country spent a million and a half more for postage during the last fiscal year than the year preceding. There could be no better index of business activity than this fact. Yes, business in match-making.

More than 32,000 men are at work on the extension of the Denver and Rio Grande Railway. Almost 19,000 are employed in old Mexico.

"A Hundred Per Cent. Better."

A patient in Michigan, who reports a gain of thirteen and three-quarter pounds in two weeks, says: "I cough about once where I did ten times before, and do not raise one-quarter the mucus from my lungs that I did. My pulse has gone down from 120 to 85. My digestion is very much improved, and the stomach retains the food. In short, *I am one hundred per cent. better than I was three weeks ago*, and I give all the praise and credit to the use of Compound Oxygen. The expressions of my friends are 'Wonderful!' 'Astonishing!' 'Almost miraculous!'" Our Treatise on Compound Oxygen, containing large reports of cases, and full information, *sent free*. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

Last Friday Charles Harris, of Hardwick Township, New Jersey, left his horse standing for a few moments in the potato patch that he was plowing, and the animal bit off some tops upon which Paris-green had been sprinkled. On the following morning the horse was found dead in his stall..... Lovers of hock will be rejoiced to hear that the reports from the Rhenish vineyards are this year very favorable, and should the fine weather which those countries are at present enjoying continue, there will be no lack of fruit. But whether 1881 will rank as a comet year can only be determined after the crop is gathered. The accounts from Rudesheim are especially encouraging.....Under the title of "Associated Agriculturists of Great Britain," a company with a capital of a million, in shares of $25, has been formed for joint stock farming in Great Britain. Each estate will be under a manager of local experience and the prospectus points to the fact that the shareholders of a farm in Holland of 4,000 acres have for 10 years divided annually 10 per cent. The Duke of Buckingham, an excellent man of business, and Lords Londonderry, Carysfort and Herries are on the council.....A plague of rats has appeared near Dagneux, in France. Innumerable swarms, which come from the direction of Lyons, have invaded many communes, doing great damage to the crops. Some farmers have killed from five to six thousand rats in their fields in a single day.....In 1860 a manufacture of fish guano was begun at Lofodon, Norway, and gradually grew from 3,798,550 kilos in 1875 to 5,972,682 kilos in 1879. [A kilo is somewhat over 2⅕ pounds.] Before 1860 this valuable matter was all wasted. It is believed that the refuse will now become much more valuable under a process by which albumen, isinglass and fish glue will be extracted from it.....The city of Newburgh, on the Hudson, is noted for its elegant trees and especially for its towering elms. A strange disease has attacked them, and unless the authorities of that slow and beautiful place should happen to wake up, the trees will probably die..... According to the English Mechanic, M. de Gasparin has rejected the theory that the fertility of volcanic soil is due to a superabundance of phosphoric acid. M. de Gasparin has discovered that the luxuriant garden between Catania and Nicolori, as well as fertile lands in Nimes and Caen, contain very small proportions of phosphoric acid. The richness of the soil about Etna may be traced, he thinks, to the concomitance of muddy formations and the climate.

The official count of the cotton crop of Georgia in 1879-80 shows an aggregate of 813,965 bales, the acreage being 2,615,563.....A cablegram of the 22nd says:—"The importation or transit through Schleswig of Danish cattle is prohibited on account of pleuro-pneumonia."....."The prizes for the grand circuit races at Chicago this week are $40,000.....Statistics of the wine and grape crop for 1880, prepared by the Department of Agriculture at Washington, show that the principal States ranked as follows in order of acres under cultivation:—

States.	Acres.	Gallons.	Value.
California	32,368	13,557,155	$4,046,865
New York	12,646	584,148	387,308
Ohio	9,973	1,633,073	1,627,926
Missouri	7,376	1,824,207	1,320,050
Georgia	2,991	903,244	1,335,521

These statistics are not entirely accurate. California, for instance, never produced 13,000,000 gallons of wine. The claim for the current year by the San Francisco Bulletin is only 12,500,000 gallons, which is more than any previous yield..... Mr. Henry G. Vennor has extended his "revised" predictions so that they include August in detail, as given below: July 21—Warm and fair, cool nights; 22 and 23—Heavy rain storms in many parts of Canada and the United States; 24 (Sunday)—Hot and windy; 25—Oppressive and stormy weather; 26—Heavy rain storm and wind; 27 and 28—Cloudy and cooler weather, with cold nights and cold showers; 29—Cool and showery; 30 and 31—Warm and high winds and rain showers; Aug. 1—Probably warm and oppressive; 2 and 5—Generally pleasant weather, fairly warm days, and cool to cold evenings and nights; 6—Fair and pleasant; 7 (Sunday)—Heat and storms; 8 and 10—Sultry weather, with heavy showers; cooler evenings and nights. 11 and 13—Heat again in the United States, with cloudy and sultry weather, storms in Canada; 14 (Sunday)—Cooler change; 15—Cooler to cold and cloudy and pleasant; 16—Storms throughout portions of Virginia; 17 and 18—Hail storms and frosts probably in some portions; 19 and 20—Heat and storms; 21—Sultry and showery; 22—Sultry and windy; 23 and 24—Heat and wind; 25 and 26—Heavy storms on the lakes, on the St. Lawrence, and around New York; 27 and 29—Cooler weather, with rains and frosts in the northern section; 30 and 31—Fair and pleasant weather, with cool evenings and nights, with indications of returning heat.....A telegram from Chicago on the 23d says that severe storms on the preceding day had beaten down the crops in many parts of the Northeast.....The Parisian journal, Le Moniteur Universel, with the omniscence characteristic of French papers, attributes all the late trouble over the election of U. S. Senators at Albany, N. Y., to the "corruption of calf-breeders." Who ever heard of a corrupt calf-breeder!.....On July 22 hail storms did much damage to crops in parts of New Brunswick, Nova Scotia, especially in Kent County.....On the same day violent hail storms did a world of injury to crops, especially tobacco, about Hartford, Conn. Violent winds at the same time greatly damaged trees and stock also were considerably injured.

A scarcity of harvesters in some parts of Ohio has brought the young women into the grain fields.....The Mass. Agricultural College will try to paddle along as an independent institution and would like to be remembered when rich men are giving away money.....At Connemara, in the west of Ireland, the old women of the vicinity are given the privilege of gathering the wool scratched off the sheeps' backs on the stones, hedges and bushes; this wool they then spin and knit into stockings, selling them at 12½ cents a pair. As many as 200 pairs are knitted by a person in a season.....English wool is subject to a purifying process in a heated room during six months before it is used, whereby the "eke," or grease and dirt, is taken out of it. American wool just fleeced from the sheep's back is worked up and, as the eke is still in it, it will not take the colors. The imperfect dyeing of American cloths results in rapid fading, while the English lasts.....Philadelphia tobacco dealers are alarmed at the influx into their market of Lancaster-made cigars that are sold at $10 a thousand, including the Government tax of $6 a thousand. This is at the rate of five cigars for two cents. It is said that they are really made of tobacco, and a dealer admits that they are as good as the cigars he retails for three cents apiece. The tobacco is grown in Lancaster, and is said to be as good as some of the Connecticut loaf.....An army of crickets seven miles wide is marching at the rate of two miles and a half a day over Lake County, Oregon, and eating every kind of vegetation in its track. Whew!.....Says the Chicago Inter-Ocean of the 14th: "A sample of wheat was exhibited on 'Change to-day from a field of eighty acres in Kankakee County, Ill. It is thought that the yield will be about 20 bushels per acre. A short time ago the owner plowed up a portion of the field, thinking that the crop would not amount to anything." It is much to be feared that farmers of Illinois and some other States lost heavily by plowing up parts of their wheat too soon..... The Mark Lane Express of the 18th, in its weekly review of the grain trade says: "The week of tropical heat has brought on crops rapidly toward harvest. Wheats vary a good deal. Ears are generally short and some insect injuries begin to be spoken of. The exceptional heat will doubtless prematurely ripen wheats. Barleys certainly want rain. In Southern and Eastern Midland counties the oat crop may be regarded as lost..... .....According to the "Cyprus Times" locusts' eggs, which would have produced 2,830,472,500 live insects, have been destroyed in the Island during this year.....The legislature of Ohio has passed a bill providing for the inspection of butter and cheese, and for inspecting dairies and all places where milk is sold, or butter and cheese manufactured.

New Zealand, in 1870, produced 1,770,363 bushels of wheat, 2,888,633 bushels of oats, 630,699 bushels of barley, and 17,895 tons of potatoes, the total acreage under cultivation being 152,982. Last year the acreage had increased to 389,729, the product being 5,461,000 bushels of wheat, 7,776,275 of oats, 1,124,281 of barley, and 27,466 tons of potatoes. Sheep raising has similarly advanced. A hundred years ago there were 29 head, and now, it is stated, there are 12,000,000.....Professor J. P. Stottes, in advocating the use of arsenic for the destruction of cotton worms, says that it will cost only a cent, and a quarter per acre to exterminate the worm with that poison. The method of employing it, which he recommends, is a solution, made by adding to five gallons of water five pounds of arsenic and one pound of soda, and boiling until the arsenic is dissolved. In using, one measure of the solution is added to one hundred and sixty measures of water, and sprinkled upon the plants infested by worms.....Hon. Wm. Gonney, Secretary of State of Michigan, gives reports of the Wheat crop from 1,036 towns, being 96 per cent. of all towns. In 1880 the wheat acreage of Michigan was 1,765,645, with yield 17.29 bushels per acre, giving an aggregate of 30,526,567 bushels. Acreage this year, 1,781,865 acres, with reported prospects of yield of nine bushels per acre, which would give an aggregate product of 16,200,000 bushels, or, say 5,000,000 bushels for shipment.

The third meeting of the Association of Agricultural Chemists will be held in Cincinnati during the Session of the American Association for the Advancement of Science, in August. The day and hour of meeting will be announced later. Manufacturers of Fertilizers, Agricultural Colleges, Experiment Stations and Boards of Fertilizer Control are expected to be represented by chemical experts. A. R. Ledoux, 17 Cedar Street, New York, Secretary.

The following is a summary of the prospects of the chief crops, condensed from the crop reports for July, by J. R. Shaffer, Secretary of the State Agricultural Society of Iowa.

CORN.—Ninety-seven counties, representing 784 townships, place the average condition of the crop at 77 per cent., being a decrease of about 4 per cent. since June 15. Heavy winds, rains and hail-storms have reduced the prospect, and many acres are worthless for want of cultivation because of excessive wet weather. Wire and cut-worms are still at work. The decrease in the product, as compared with the previous year, is estimated at 60,000,000 bushels.

WINTER WHEAT.—Sixty-three counties, representing 267 townships, place the average condition at 55 per cent., a decrease of 32 per cent. in one month. Many acres were plowed up, being winter-killed, and chinch bugs and rust have been fatal to the crop.

SPRING WHEAT.—Seven hundred and twenty-four townships in 88 counties give the average condition of the crop at 72 per cent., a decrease of 16 per cent. since the June report. The loss is attributed to chinch bugs, rust and wind and hail storms and much of it is on the ground. Many acres are reported as not worth harvesting. Des Moines County reports the lowest average—18 per cent. The highest average is reported from Hancock and Kossuth Counties—100 per cent. Basing an estimate on these figures, as compared with the crop of the previous year, there will be a deficit in the product of 17,000,000 bushels.

OATS.—Ninety-seven counties, representing 793 townships, place the average condition at 92 per cent., a decrease of only 2 per cent. There is some complaint of rust and lodging.

FLAX.—Five hundred and ten townships, reporting from 69 counties, give the average condition as 89 per cent.—an increased prospect in product of 9 per cent. over the previous report. The area has been largely extended and promises to give better results than almost any other crop grown.

IRISH POTATOES.—Ninety seven counties, representing 777 townships, place the condition at 93 per cent. There is some complaint of the bug injuring the crop prospects.

MEADOWS.—Ninety-four counties, from 756 townships, reporting upon the condition, give the average at 96 per cent.

PASTURES.—Ninety-four counties, from 732 town-

ships, place the avorage condition at a fraction over 100 per cent.

TOBACCO.—One hundred and two townships in 56 counties give the average condition of the crop at 87 per cent.

A Sanitary Measure.

Life and health are preserved by carefully aiding nature whenever it shows lack of ability to carry on its work. For torpid liver, bowels or kidneys, no other remedy equals Kidney-Wort. It is sold in both dry and liquid form by all druggists.—Call.

Thousands of women have been entirely cured of the most stubborn cases of female weakness by the use of Lydia E. Pinkham's Vegetable Compound. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

Oh, how refreshing, palatable and reviving is a draught of cool water with Hop Bitters in it, to a fever patient.

BURNETT'S COCOAINE

Softens the hair when harsh and dry.
Soothes the irritated scalp.
Affords the richest lustre.
Prevents the hair from falling off.
Promotes its healthy, vigorous growth.

The Markets.

CROPS AND MARKETS.

CROP reports are still very conflicting both in this country and Europe. The report of the Department of Agriculture we published last week, gives the three States of Illinois, Michigan and Iowa, 27½ million bushels of wheat more than the State reports. The very unéven nature of the stand even in the same or adjoining fields renders it almost impossible for different people to come to the same conclusions about the average yield in any section. On the whole, however, the outlook for wheat of late is worse than it was some weeks ago. Thrashing shows that while the quality is good, the yield is generally deficient. Even in the quality, however, there is a great deal of difference. Most of the samples of the new crop received here are of Fultz, and that raised on sandy soil is considered deficient in strength and flouring qualities, while that grown on loamy and limestone soils gives much satisfaction to the millers. Within the week most of the daily papers, East and West, that have been loud in their prophecies of an abundant wheat harvest, have greatly modified their tone, and nearly all of them now agree in the opinion that the crop will be considerably short. The market, too, proves that this opinion, which we expressed a long time ago, is now generally accepted, as prices have stiffened since our last report. In comparison with prices of grain at this time last year, those on Saturday last at this place were considerably better; No. 1 white wheat was $1.15 per bushel last year and $1.27 this; No. 2 red, $1.10@1.12, then; $1.28½@1.29 now, and on all grades prices now average fully 10c. per bushel more. Corn, too, is from 9c. to 11c. higher, and oats from 8c. to 10c. In other markets the same difference prevails. Chicago being a Central point, the following table of prices there for No. 2 Spring wheat, on the 1st and 15th of each month, will be instructive and interesting:

1880.	1st.	15th.
July	.87½@ .88¼	.94½@ .95¼
August	.90½@ .91¼	.87½@ .88¼
September	.87½@ .88	.94¾@ .95¼
October	.92¾@ .93¾	$1.00½@1.01½
November	$1.01¾@1.02¾	$1.05¾@1.06
December	$1.09¾@1.10	$1.00½@1.00¾

Average price for six months, 97c.

1881.	1st.	15th.
January	.97¾@ .98¼	.97½@ .97¾
February	.99½@ .99¾	.99¼@ .99¾
March	.98½@ .98¾	$1.00½@1.00¾
April	$1.00¾@1.01¼	$1.02½@1.02¾
May	$1.01¾@1.02¾	$1.00¾@1.01¾
June	$1.09¾@1.10¼	$1.08¾@1.09¾
		24th.
July	$1.10½@1.11	$1.19@1.19½

Average price, January 1 to July 12, 1881, $1.03.
Average price, July 1, 1880 to July 24, 1881, $1.00.

It will be seen that the average was materially reduced by the low prices during the first three months.

Last Tuesday there was immense excitement in the Chicago wheat market on the discovery that a "corner" existed in wheat, and indeed in nearly all other agricultural products, and prices there went up rapidly and those at other points throughout the country sympathized with them. Here also on Thursday morning both Winter wheat and No. 2 corn were worked up to the highest quotations yet reached in the present upward movement, but in the afternoon there was a tumble of fully 1½ to 2¼ cents per bushel, followed near the close of the day by a slight rally. Besides the operations of the "corner" manipulators, the bad outlook for the crop has raised prices for wheat; for reports from the Spring wheat region tell of much damage from the tropical sun as well as from storms and insect pests. The cablegrams from Europe, too, are not quite so flattering as formerly. In the south of England the wheat harvest had already begun on the 20th of July. Some new wheat will be in market before the end of the month. Just now no speculative sales are made there, as folks are buying only as they are forced to do so; and prices there are lower than here, which, of course, greatly checks exportation. Accordingly much of the grain that arrives here is warehoused, the quantity of wheat so stored having increased about 508,700 bushels last week, and that of corn about 995,000 bushels. Nearly all the grain so put away is on speculative account, kept in expectation of a rise or to prevent a fall by overstocking the market. Of wheat the visible supplies on July 16 were 14,823,400 bushels, against 15,620,000 bushels the preceding week, and 10,924,100 bushels the same week last year, showing a decrease for the week of 796,600 bushels. Of corn the aggregate was 15,979,200 bushels, against 15,228,600 bushels a week earlier, and 15,477,900 bushels same week last year, indicating for the past week a gain of 450,600 bushels. The visible supply of oats is now 7,314,800 bushels, against 7,465'150 bushels the preceding week, and 1,993,300 bushels corresponding week last year. The following is a comparative exhibit of the amount of wheat in sight:—

	July 9, '81. Bushels.	July 10, '80. Bushels.
Visible supply in U. S. and Canada	15,619,976	10,979,880
On passage for the United Kingdom	16,424,000	14,720,000
On passage for the continent of Europe	4,432,000	5,760,000
Grand total	36,475,976	31,459,880
Previous week	38,418,746	32,252,120
And of Indian corn in sight—		
Visible supply in U. S. and Canada	15,528,881	17,240,688
On passage for the United Kingdom	5,360,000	4,776,000
On passage for the continent of Europe	3,568,000	5,200,000
Grand total	24,456,581	27,216,688
Previous week	23,227,247	25,903,818

During the eight weeks ending July 20 the export clearances for Europe from the ports of Montreal, Portland, Boston, New York, Philadelphia, Baltimore and New Orleans amounted to 595,419 barrels of flour, 15,148,820 bushels of wheat, 16,105,891 bushels of corn, 273,259 bushels of rye, 953,250 bushels of peas, 718,837 bushels of oats.

The price of corn is steadily improving and will probably continue to do so until the next crop comes into market. While the stock of old wheat on hand is unusually large, that of corn is unusually small. The amount raised last year was 1,537,536,040 bushels, according to the Agricultural Department, which estimated that 200,000,000 bushels more than usual were consumed owing to the length and severity of last Winter. On May 1, the reports of the Department stated that 14 per cent. of this, or a little over 215,000,000 bushels, were still on hand, exclusive of corn owned by dealers at the time—possibly 50,000,000 bushels. This would make 265,000,000 for the whole country on May 1. The average domestic monthly consumption of corn during the past two years, has been 115,000,000 bushels in Summer and about double that quantity in Winter, so that there was then only enough on hand to last for four months, or until September 1st, exclusive of what might be exported, which, according to the statistics of the Treasury Department, amount to about 100,000,000 a year, or 33,000,000 bushels for those four months. It will thus be seen that the prices of corn ought to be good, as the demand is likely to exceed the supply. Reports of the growing crop are, on the whole, favorable, showing considerable improvement from the prospect for it earlier in the season.

The reports about oats are good, and, as predicted by us earlier, the aggregate yield must be unusually large. In view of this, prices have a downward tendency. Reports of the cotton crop, average good, and there seems to be a larger acreage under it than was reported earlier in the season. The increase is now put at not less than four per cent. over last year's area, and the heaviest crop ever picked is expected, most estimates putting it as high as seven millions bales, and some adding half a million to that. The prices for the next crop will, therefore, most likely be comparatively low, but just as it is unwise to "count one's chickens before they're hatched," it is not safe to reckon up the cotton bales until the cotton is picked, in view of its many enemies and the risk of insufficient labor at the critical time. The latest reports from Delaware and the Michigan fruit belt declare the peach crop a failure. Although reports of a shortage or failure of this crop are circulated every year about this time, while later on there are always plenty of peaches, it is very likely indeed that this year peaches will be very scarce and high-priced. The wolf has come at last.

The Chief of the Bureau of Statistics reports that the total value of the exports of domestic breadstuffs from the United States were as follows:—June, 1881, $20,605,915; 1880, $28,253,990; six months ended June 30, 1881, $111,981,154: 1880, $122,356,985; twelve months ended June 30, 1881, $265,561,328; 1880, $282,132,618.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 23, 1881.

BEANS AND PEAS.—Marrows have had a fair inquiry and have ruled generally firmer: sales are reported at $2.45 f. o. b. Choice medium beans are quite scarce and held at $2.45, but that is above a selling price for car lots. Choice pea beans are very scarce; a lot could be easily sold at $2.55; only choice inquired for. White Kidney beans are quiet and unchanged. Red Kidney of choice quality have had a moderate sale at steady prices, but are quiet at the close. Turtle soup beans are without sales, flat and nominal. Prime green peas are steady; a lot of peas from Vermont but not of a quality to suit our trade sold at $1.20, including bags. Southern B. E. peas nominal.

Marrow beans, prime, $2.43½@2.45; other, $2.25@2.37½; medium, choice, $2.40@2.42½; other, $2.20@2.35; pea, choice, $2.50@2.55, fair to good, $2.30@2.45; white kidney, choice, $2.40@2.45; other, $2.25@2.35; red kidney, choice, $1.55@1.60; other, $1.40@1.50; black or turtle soup, $1.30@1.35. Peas, green, prime, in bbls, $1.50@1.55.

Receipts for week, 4,100 bush.
Exports do. 535 pkgs.

BUTTER.—Receipts for the week 42,692 pkgs.; exports 9,533 do. A feeling of tameness pervades the market that is frequently followed by actual dullness. A lull in the demand, however, may reasonably be expected as August nears and city consumption is effectively reduced. Quotations for Western are generally weak.

Creamery—Western, choice 22@22½c; good to prime, 21@22c; Ohio choice 22c; good to prime 21@21½c; State and Penn. 21@22½c.; good to prime 22@22½c; sweet cream, 22½@23½c.; fair 20@20½c.; State dairy pails and h'f tubs, choice, 21c; good to prime, 19@20c.; fair to good 18@19c; Welsh tubs, choice 20@21c.; good to prime 19@20c; fair to good 18@19c; tubs poor to fair 16@18c; firkins fine 21@22c; fair to good 20@21c; Western imitation creamery, 17@19c.; dairy, fresh choice 18@19c.; good to prime 16@17½c.; fair to good 15@16c; factory Iowa, fine June 17@18c.; Ohio and Ind. June 15@16c; good to prime 14@15c; fair to good 13@14c.; poor 11@12c.

Receipts for week, 49,240 pkgs.
Exports for week, 12,730 do.

CHEESE.—Only fine cheese, perfect in condition has been in comparatively light supply and fairly sustained; The finest State colored are still quoted at 10¾@11c. to-day, but the outside figure is very full. Creamery skims show a decline of about ½c., but are in fair demand.

State fact'y, fine, colored, 10¾@11c. do. white, 10½@10¾c; good to prime, 9¾@10¼c; fair to good 9½@9¾c; poor to fair, 8½@9c.; Wis. good to prime 9¾@10c.; fair to good 9@9¾c; Ohio, factory cheddar, fine 9¾@9¾c; do. fair to prime 8½@9¼c; flat, fine 9c; do. good to prime 8@8½c; do. fair to good 7½@8c; do. poor 7@7½c; creamery part skimmed, 6@7½c.; full skims, 3@4c; full skimmed factory 3@4c.

Receipts for week, 123,735 boxes.
Exports for week, 137,261 boxes.
Liverpool cable, 54@55s.
Steam to Liverpool, 28s.6d.@32s.6d.

COTTON.—Southern combinations have not supported the market here and the market has ruled weak, with a shade of recovery at the close.

Quotations are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Strict good ordinary	9	Middling	10 15-16

The close of the market was officially reported as follows:—
July, 11.67@11.68c.; August 11.71c.; September, 11.23@11.24c.; October, 10.62@10.63c.; November, 10.43@10.44c.; December, 10.43@10.44c.; January, 10.55@10.56c.; February, 10.67@106.9c.; March, 10.79@10.81c.; April, 10.91@10.93c.

DRIED FRUITS.—Receipts for the week, all kinds, 23 pkgs.; exports 825 do. apples. The offering of evaporated is light and small buyers have paid an advance. Sun-dried have been marked up and are firmly held at the new figures. State and Ohio grades are doing the best. No movement in peaches; further advices from crop or drying sections still favor the high views of holders. Small fruits are not plenty; it is early for wholesale buyers to look around and prices for new cannot be called settled.

Apples, evaporated rings, 9@9½c.; rings, prime, 8½@9c; fair 8@8½c; North Carolina sliced, fancy white 4½@5c, good to prime 1½@4¼c; Va, 4@4½c; Tenn. in bbls, 4½@4¾c, do. bags 4@4½c; State fine cut 4½@4½c., quarters choice 4½@4¾c; O. & Mich. choice 4½@4¾, Western, fair to good 4@4½c; evaporated peaches peeled 25@28c.; unpeeled 13@14c; N. C. peeled, extra choice 21@22c; choice 19@20c; Ga. peeled 17@20c; State 17@19c; 1879 peeled, poor to prime 10@18c; unpeeled halves—N. C. 1880 5½@5¾c.; Tenn. 5@5½c; quarters N. C. 5@5½c. Plums State black 10@11c. Blackberries prime 7½@8c. Cherries Southern 14c. Raspberries prime 24c. Whortleberries prime 11@11½c.

Receipts for the week, all kinds, 290 pkgs.
Exports dried apples, 900 pkgs.

EGGS—Receipts for week, 8,915 bbls.; do. last week 8,167 do. The week has been a severe one on eggs. The Producers' Price Current says:—The oldest dealers remember no worse time. The Western stock arriving has been nearly all bad. Many lots have been carted off to the dumping ground as entirely worthless. Often one-half to three-quarters of the eggs have been found bad in counting out; in many instances lots which were evidently good when shipped have had the hatching process started in them by the heat on the way. In two instances chickens hatched in the barrels have been taken out alive. It was thought that the refrigerator lines would enable shippers to get their eggs to market without such losses from hot weather on the way, but in this there is great disappointment; some, if not all, of these lines have delivered their eggs in very bad order, showing that they have not given shipper the service for which they are paid. A few choice Western arriving to-day have sold at 16c., but few receivers have stock worth that price. Lots which have been held here in ice-houses in perfect condition have turned out generally better than fresh receipts. Inferior lots are offering at almost any price, from $2 per barrel up to 15c. per doz. There is a fair call for good Canada at 16½@17c. State fresh eggs arriving by express in perfect condition have sold to-day at 18c., but some lots have not been so desirable and have sold lower.

Jersey, single bbls. ₩ doz. 18@19c.; State and Pa. fresh laid, 17½@18c.; Canadian, fresh laid, 16½@17c.; Western, fresh laid, 15@16c.; Western and Southern, inferior, 12@14c.

FLOUR.—A strong feeling prevails in flour following the activity in wheat, and the market is fairly active.

No. 2, ₩ bbl., $3.30@4.10; State and Western superfine, $4.30@4.80; city mills extra, $5.25@6.50; Spring wheat do. $4.85@5.25; Spring XX and XXX, $5.40@6.75; patents, $6.00@8.00; Ohio round hoop shipping, $5.10@5.40; trade brands, $5.50@6.25; St. Louis extra, $5.15@5.50; do. double extra, $5.15@6.25; do. family, $6.40@7.00; South'n shipping, $5.40@6.00; do. XX and family, $6.25@7.25. Rye, $5.00@5.55. Corn-meal, Brandywine, $3.40@3.50; Western, $3.00@3.30.

Receipts of flour for week, 114,900 bbls.; do. corn-meal 7,250.

Exports of flour, 71,000 bbls.; do. corn-meal 6,975.

FRESH FRUITS.—With consumers more or less away and so many items offering, the market is unsettled and prices are weak.

Peaches, Md. Hales, ₩ crate, $1.50@3; North Carolina ₩ bush. $2@4; Ga. ₩ ½-bush. crate, $1@1.50. Gooseberries, green, ₩ bush. $1.25@1.50. Whortleberries, ₩ bush. $2@2.50. Raspberries, natives ₩ ½-cup, 1½@2c.; Brandywine, ₩ pint, 4@6c.; Antwerp, ₩ cup, 3@4½c.; Blackberries, Wilson, ₩ qt., 10@12c. Currants, small, ₩ lb. 2@3c.; Cherry, 2@4c. Plums, Beach, ₩ qt. 6@8c. Nutmeg melons, ₩ bbl. $2.25@3. Pears, cooking, ₩ bbl. $3@4; Bell, $2@5.50; Harvest, $4@4.50; fancies, $3@6.50; Va. Bartlett ₩ crate, $3.50@4.50. Peanuts, Va. hand-picked ₩ lb. 5@5½c.; do. fancy, 4½@4¾c.; do. extra prime, 4½@4¾c.; do. good to prime, 3½@4c.; shelled, 3@3½c. Pecan nuts, ₩ lb, 7@11c.

GRAIN.—Crop reports indicating a smaller yield have given strong impetus to the wheat market and prices are firm and better with the largest speculative business ever known. Corn has shared in the speculative excitement and there have been liberal sales for export. Oats have done better with a more active trade.

Wheat, Spring $1.10@1.24; do. No. 2, $1.21@1.23; do No. 3, $1.15@1.18; red Winter No. 2, $1.28@1.28½; red Winter $1.15@1.32; white Western and State $1.17@1.27½. Rye, 87@91c. Oats, white No. 1, 43@43½c.; white No. 2, 41½@45c.; white No. 3 43½c; mixed No. 1, 45c; do, No. 2 44½@44½c; do. No. 3 42@43½c; Corn, West'n mixed 56@57½c.; do. No. 2 55@57½c.; do. do. yellow 58@59c; do. do. white 58@59c; Southern yellow 58@62c.; do. white 57@59c.

Receipts for week, wheat, bush., 1,428,600; corn, do 1,778,550; oats do. 311,400; rye, do. 3,711; malt, do. 59,419; barley, do, 700; rice pkgs. 650.

Exports for week, wheat, bush 612,000; corn, do. 1,242,000; oats, do. 25,329; rice, pkgs. 1,200.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports and on rail, on lakes, on canals and on Mississippi River:

	1881. July 16. bush.	1880. July 17. bush.	1879. July 19. bush.
Wheat	14 823,393	10,924,075	12,473,247
Corn	15 979,164	15,477,913	10,796,086
Oats	7,317 764	1,991,503	1,536,691
Barley	154,9 8	180,656	357,8 9
Rye	114,077	133,674	311,713
Total	38,389,356	28,709,631	26 606,456

HAY AND STRAW.—Receipts of hay continue light and stock in store is reducing. The firm feeling has developed into an advance of about 5c. ₩ 100 lbs. Straw about steady.

Hay, prime timothy 85@90c. ₩ 100 lbs.; medium do. 70@75c, do.; shipping grades 50@55c. do.; clover mixed 45@55c; clover 35@40c. Straw, long 75c; short, do. 50@55c.; oat and wheat straw 45@50c

HOPS.—The market is very quiet. Brewers are the principal buyers and they take stock only for immediate necessities. There is a good deal of talk about the crop in this State. Some quite unfavorable reports have been received, estimating the yield as not more than two-thirds of last year. Other observers estimate fully three-fourths of the yield of last year. The vine in most localities is very short-armed and in the blow. Should the English crop turn out as well as it promises, but few American hops of the new crop will be wanted for export, and indications are that we shall have a considerable surplus beyond home requirements, even with a considerably lighter crop than that of last season.

Crop of '80, choice, 20@22c; good to prime 18@19c; fair to good, 13@18c; poor to fair, 11@13c; Eastern, 11@18c.; '79's, fair to prime, 12@15c.; '78's, 5@8c.

Receipts for week, 353 bales.
Exports for week, 38 bales.

POULTRY AND GAME.—Dressed is in fair supply for hot weather. The wants of best trade are helped considerably by the arrival of Bucks County stock. The main improvement of the week is in fowls. Fine turkeys have sold well.

Turkeys, Phila. prime ₩ lb 15@17c.; State & Western d. p. 15@16c. Chickens, Phila. Spring, prime, 22@24c.; Bucks Co. Spring, 21@23c; N. J. Spring, 21@22c.; State and West. Spring, 20@22c. Fowls, Phila. d. p. 15@16c.; Bucks Co. 15@16c.; N. J. d.p. prime, 15@16c.; N. J. scalded 14@15c.; State and Western d.-p. prime, 15c; do. scalded, 14c.; do. coarse 13½@13c. Ducks—Spring, Phila. ₩ lb 19@20c.; do. Jersey and Bucks Co. 16@18c.; old, fair to good, 12@13c. Squabs, white ₩ doz. $2; do. dark, $1.25@1.50.

Live fowls declined to 14c. early in the week and have since remained barely steady at that price for the best lots. Geese are not plenty, but are very little wanted and rule weak. Old pigeons are in demand at 45c. Young ones dull at 25c. Most of the lots coming are of mixed quality and sell at a price between those quoted for old and young.

Spring chickens prime ₩ lb 18c.; other 15@17c. Fowls, ₩ lb. 13@17c; roosters, 6@8c.; turkeys, 12@15c.; ducks, ₩ pair 70c@$1; geese, extra $1.75; other $1.00@1.50; pigeons, 25@45c.

PROVISIONS.—Lard has run up in price beyond exporters' views or margins and all interest is among home manipulators. Pork has continued to go out for export; not much home demand. Cut meats quiet here though good orders especially for bacon are being filled at the West.

Pork, extra prime, $14.50@14.75; West'n mess, new, $18@18.25. Lard, steam Western ₩ 100 lbs, $12.10@12.15; prime city, $11.75. Hams, smoked city ₩ lb 12@12½c; pickled Western, and city 10½@11½; Shoulders: smoked city, 8½@8¾; pickled, 7½@7¾; rib bellies, pickled, 9¾@10. Bacon, long clear, west. 9¾@9¾. Beef, western mess, ₩ bbl., $12@14; India mess, tcs. $26@28; best hams bbls, $23.

Receipts for week—Beef, bbls and tcs. 1,097; pork, bbls, 6,471; Cut meats, pkgs. 17,532; lard, do 20,476. Exports—Beef, bbls and tcs. 2,180; pork, 2,843; cut meats lbs. 5,719,466; lard, 1,863,426.

SUGAR.—Quotations for refined

Hard sugars—crushed ₩ lb 10¾c; do. powdered 10¾@10¾c; do. granulated 9¾@10c; do. cut loaf 10¾c; confectioners' "A" 9¾c; coffee "A" standard 9¼c; do. off "A" 9@9¼c; white extra "C" 8¾@8¾c; extra "C" 8¼@8¾c; "C" 7¾@8¼c; yellow 7½@7¾c.

TOBACCO.—Seed leaf in good demand. Hhds. quiet. Foreign buyers the main stay of the market, not operating at moment.

Seed leaf, crop of 1880 choice at 10@18c. for assorted lots; Pa., 7½@10c. for State, Onondaga, Havana seed and ital., and 10@13c. for N. E. 2ds.; also crop of 1879 at 7@40c. for Pa. fillers and wrappers and 12@16c. for N. E. 2ds; Ky. lugs 4¾@5½c. and leaf 6@12½c

VEGETABLES.—Potatoes are in good demand; prices obtain some support by Havana wants. Exports for week 25,000 bbls. L. I. & N. J. quoted $1.35@1.50 bbls. in bulk. Garden truck in good supply and assuming its usual Summer cheapness.

Sweet corn, Jersey ₩ 100 75c@$1; Burlington corn do. 50@75c; Green peas, L. I., ₩ bag, 50@75c; wax beans L. I. do. 75@$1; string beans L. I. do. 50@61c, cucumbers ₩ 100 $1@1.25c; Phila ₩ bbl. $3, egg plant Phila ₩ doz. $7@8; Tomatoes Phila ₩ bskt. 60@70c; N. J. & L. I. ₩ bu. $1.50@1.75; Md. $1.50; Nfk. ₩ cr. 25@60c; squash Norfk marrow ₩ bbl. 75@$1; L. I $1@1.25; cabbages, Flat Dutch ₩ 100 $3@4, beets, L. I. ₩ 100, bchs $1@1.50; onions, potato prime ₩ bbl. $4.25; fair to good $3.50@4; lettuce 30@60c; carrots ₩ 100 bchs $1@1.50; white turnips Jersey $1.50@3.00; turnips Russia ₩ bbl. 75c@$1; cauliflower, J'y & L. I. $1.50@4.

WOOL.—The new clip is arriving forward liberally and with free stocks available holders views are slightly shaken. The condition is thought to be one likely to follow the excited opening and there may be no serious break in quotations.

Ohio, Penn. and W. Va. XXX and picklock, 43@45c.; X to XX, 40@43c.; No. 2 to No. 1, 40@45c. coarse, 34@38c.; combing 40@45.

Fall, low grade and burry 16@20c. Texas—choice, free, 28@31c.; fair to good, 24@26c.; low grade and burry 17@20c. Pulled super 38@43c.; extra 35@38c; No. 1, 20@23c; combing, 35@40c.; lambs, 38@40c. Tub washed, fair to choice, 35@41c.

LIVE STOCK MARKETS.

NEW YORK, Saturday July 23, 1881.

BEEVES.—Receipts for the week 14,481 head; do last week 13 031 do. With more cattle offering than the demand called for the market was extremely dull, and the most disastrous one for the selling interest that we have had this month. The large arrivals from the West have convinced butchers that for the present there is no scarcity of beef cattle. Corn-fed steers sold fairly at about steady prices, but poor to medium natives were very dull a strong ¼c. lower than on Wednesday; Texans were also quoted ¼c. off and were selling slowly; transactions ranged 7¼@8¼c. to dress 55 ₩ to 11@12c. to dress 58@57 lb. Bulls nearly unsalable.

SHEEP AND LAMBS.—Receipts for the week 23,902 head; do. last week, 33,198 do. Heavy receipts and large stock on hand have placed buyers at a disadvantage. The small business reported up to 12.30 p. m. was at 4@5½c. for sheep; 5@6¾c. for Ky., Tenn. and Va. lambs; 6¾@7¾c. for Canada, State and Pa. do. with a small bunch of Canada lambs sold up to 8¼c. and at N. J. at 8½c.

SWINE.—Receipts for the week 25,052 head; do. last week 25,494 do. Receipts mainly consigned to slaughterers direct. Market quoted nominally firm at 6¾@6¾c.; lighted city dressed Western 8¾c.

MILCH COWS.—The receipts during the past week were, generally speaking, of poor quality and sales were slow, prices ranging $35@65 ₩ head.

FARM IMPLEMENTS & SEEDS.

Call on or write to R. H. ALLEN & CO., New York, for whatever you want of the above.
Address 189 & 191 Water St.

New York State Fair.

The 41st Annual Cattle Show and Fair of the New York State Agricultural Society will be held at

ELMIRA,
Sept. 12th to 17th, 1881.

Entries Close Saturday, August 13th,

Excepting only entries of Flowers, Plants and Fruits, which may be made at any time until Tuesday, September 13th, at 10 o'clock A. M. All other entries must be made by mail or otherwise, at the Society's Office, at Albany, on or before Saturday, August 13th.

Competition Open to All.

The Premiums offered may be competed for by residents of other States, and countries, on equal terms with residents of New York. Copies of the Premium-List and Regulations will be mailed on application.

BLANK FORMS OF ENTRY

Will be sent on application. In writing for them please specify what it is proposed to enter, as different forms are provided for different classes of exhibits. Address

N. Y. STATE AGRICULTURAL SOCIETY,
ALBANY, N. Y.

Reading for the Young.

MENDLE'S SONGS FOR CHILDREN.

THE SOAP BUBBLE.

FAR over the hills, and over the lea,
As far as the eye could possibly see,
A bubble of air went floating along—
Wherever it floated it sang this song:

"I came from the end of a little pipe-stem,
Which Arthur had dipped in a saucer of soap;
But look at me now, all so round and so plump,
I never could stay in a corner and mope.

"They say I am empty and puffed up with air—
But look at my sides with their beautiful hues;
I can dance over meadows and dance over brooks,
And as I go dancing I frighten the 'blues.'

"I dance on the sunlight and float up to heaven;
And when I fly up till I'm out of their sight,
The boys and the girls talk it over together,
And call me a sweet little thing of delight.

"I float on the breath of a little child's mouth,
And upward I go to the heavens above,
Because little children are wedded to truth,
And breathe from their hearts a pure spirit of love."

FARMING FOR BOYS AND GIRLS—NO. 29.

HENRY STEWART.

What is Manure?

AFTER studying the nature of the soil; the characters of the plant, and the feeding of animals, we are led directly to the subject of manure. For the soil requires manure to remain fertile; plants need it for food; animals produce it; and its quality and value depend upon the kinds of food that have been used by the animals. The care and use of manure is the principal thought of the farmer. Without it he can have no crops, but with it there is hardly a limit to the productiveness of the soil. The market gardener who often uses 100 loads per acre at a cost of $200 to $300, and after that applies 1,000 pounds of guano at a further cost of $30, produces $1,000 to $1,200 worth of produce to the acre in a season; while the farmer who uses it very sparsely may not be able to get more from an acre than a poor ten dollars' worth. This may be a very strong way to put this case, but it is true and its application may be of use in showing how true it is in the cultivation of the soil, that out of nothing nothing comes, and that the richer we can make the soil the more we may be able to get out of it. It is very useful for a young farmer to know what manure is; how it operates in the soil and how it should be used.

Manure may be said to be anything that feeds the crops that are grown upon farms or in gardens. But in common use it is considered to be the dung of farm animals mixed with whatever litter, such as straw, that may be used to absorb it. It is certain that the manure can contain nothing but what was in the food of the animals and not all of that, because a certain portion of the food is used up in supporting the animals and making flesh, bone and other portions of the body. We know very nearly how much of the food is thus used and as we know precisely of what the food consists, it is quite easy to tell what is left in the manure. As plants require to be fed chiefly with three substances, viz, phosphoric acid, potash and nitrogen, we are more concerned about these than anything else that the manure may contain and disregard all besides. The following tables show how much of these elements of the food escapes in the dung and the urine and in both together and of course how much is used up by the animal.

TABLE 1.

In 100 pounds of the dry substance in the food there is found in the waste matter discharged

Dry matter.	Cow. lbs.	Ox. lbs.	Horse. lbs.	Sheep. lbs.
In dung	38	45½	42	47
In urine	9	5⅝	3½	6½
In the whole manure	47	51⅛	45½	53½

TABLE 2.

In 100 pounds of organic matter in the food there is found in the waste matter discharged

Organic matter.	Cow. lbs.	Ox. lbs.	Horse. lbs.	Sheep. lbs.
In dung	36½	44	38⅝	45½
In urine	6	3⅛	2½	4
In the whole manure	42½	47⅛	40⅝	49½

TABLE 3.

In 100 pounds of nitrogen in the food there is found in the waste matter discharged

Nitrogen.	Cow. lbs.	Ox. lbs.	Horse. lbs.	Sheep. lbs.
In dung	45⅛	51	56	43⅜
In urine	18⅛	38⅛	27⅛	51⅛
In the whole manure	63⅜	89⅛	83⅛	95⅛

TABLE 4.

In 100 pounds of the mineral matter (phosphoric acid and potash) in the food there is found in the waste matter discharged

Mineral matter.	Cow. lbs.	Ox. lbs.	Horse. lbs.	Sheep. lbs.
In dung	53¾	70⅜	85½	63⅛
In urine	43⅛	46⅜	16⅛	40⅛
In the whole manure	97	117⅛	101¾	103⅛

In the last table it is seen that there is an excess of mineral matter in the manure. This should not cast doubt upon the figures because account must be taken of the water drank with the large quantity of food required to contain 100 pounds of phosphoric acid and potash, and the water so used will amount to several thousand pounds while so much food is consumed. The water may easily contain in solution this excess of mineral matter. The figures, however, show that a grown animal discharges in the wastes very nearly all of the mineral matter of the food and this is so important that further consideration should be given to it.

THE BOOK FARMER.

A Leaf from a Life.

BY MRS. E. J. R.

WELL pet, we are going into the country," said Herman Carroll to his pale young wife, as he came in from his business with a huge pile of books under his arm, "see, here are agricultural works, and I intend to make a capital farmer of myself."

Mrs. Carroll, who had looked up with a startled air when her husband first entered, burst into tears. Her childhood and youth had been spent in the country, and during the long months of failing health she had thought with a heartsick longing of the old familiar scenes, but three little daughters, and the cares of her little household, more than all her husbands' business cares seemed to forbid the hope that she should ever look upon the dear old haunts again.

"Why Anna," said her husband coming to her side, "I thought this would please you," and he stroked her black silken hair soothingly noting with pain the almost transparent whiteness of the blue veined forehead.

"What would please me? Oh, Herman, you can't know how I long for the country, but I know that it cannot be."

"Why not puss? people live in the country, a good many people."

"But we are not rich and you have all your life been a merchant; was any such thing ever known—a New York merchant turning farmer?"

"We will make a precedent then," he answered, "but seriously, I have an offer for my store and business which I shall accept. Then a friend tells me he knows a pretty farm of nearly one hundred acres, near a thriving village in the central part of the State and I have about decided to buy it. So I must begin to study for my new—profession shall I call it?"

Mrs. Carroll sank back in her easy chair, her hands clasped above her heart which was beating wildly, but she wore a happy smile, while she saw her husband carefully examining his authorities with a grave business like air.

"You always do succeed in what you set out to do, Herman," she said at length, "but this seems too good to be true."

There was a good deal of homely prose however, before the Carroll's found themselves settled in the large roomy house which was to be their future home. Mr. Carroll's new neighbors shook their heads when they learned his history and said, "he'll soon tire of farming, besides the farm is all worn out and needs a deal done to bring it up.",

This was precisely the state of things which Mr. Carroll found to be true, but instead of despondingly he set himself to work. He did this more cheerfully when he saw the faint color coming into his wife's pale cheek and the brightness in her eyes. The little girls, too, never tired of admiring the sleek fat cows, which constituted Mr. Carroll's dairy, nor the gentle ponies which were to do the work of the farm. And Mrs. Carroll, not to be outdone, learned the art of butter making. She skimmed the thick, leathery cream and placed it in the churn with her own hands, and then the little girls churned it, singing as the dash went up and down so many, many times:

"Churn, butter, churn,
Peter's at the gate
Waiting for the butter cake,
Churn, butter, churn,"

"Who taught you that, chicks?" said mamma, stopping in the door to listen.

"Aunt Dinah over the way! Isn't it pretty and it helps bring the butter," said Anna, who, in the dignity of her ten years assumed the leadership of her sisters.

Mr. Carroll laughed, and the eager little faces watched the whole proceeding of taking up, washing and salting the butter with interest.

"Really pet, you have learned the art of making "gilt edged butter," said Mr. Carroll at the breakfast table the following morning helping himself liberally. "I never tasted sweeter butter."

"It must be because my little birdies churned it," said Mrs. Carroll, laughing.

"And oh! papa it was such fun," said the three little girls in a breath.

Mr. Carroll did not find farming "such fun" as the children did. The hard work of plowing and planting and cultivating the soil was different, from selling goods, but he persevered. There were now and then rainy days and the ever returning holy Sabbath, for Mr. Carroll was an earnest Christian man and kept holy time with great strictness.

The result was, that although often very tired he grew stronger and more vigorous. Mrs. Carroll too, constantly improved in health and the little ones were fat and rosy.

Mr. Carroll spent a good deal upon fertilizers, though his rustic neighbors shook their heads and predicted ruin.

"I must feed my farm if I expect it to feed me," he answered and went on with his "book farming."

"It beats all what crops that Carroll is having!" said these same neighbors a few months later.

"A pretty pass things have come to when we must look to a city feller for a pattern," growled another.

"I don't care who sets the pattern so we get big crops" answered the first speaker.

The years rolled on, nearly a score of them, and the gentle, sweet-faced Mrs. Carroll was still the center of a happy home. Three bright intelligent graceful girls, who had grown up into womanhood receiving the mother's impress, gathered around the hearthstone.

Herman Carroll looks abroad upon his fertile acres, and around upon his happy home-circle, and although his locks are silvered, says with a grateful heart,

"We have made a precedent, dear wife. Book farming may pay," to which she answers lovingly:

"We owe it all to your great loving heart, Herman, and to your sterling good sense. Yes, brains are needed in successful farming and all your neighbors now respect the "book farmer."

THE HORTICULTURAL CLUB.

THE other day I received a letter asking for information about the Horticultural Club, as to when it originated, how many members it had, etc., etc. As this is not the only letter of such a nature that has reached this office, I will answer the query in this column so that all may know.

It is probable that the RURAL visits but few farmers' homes in which there are no children, and in a large majority of cases these children, when they grow up to manhood and womanhood, will become farmers and farmers' wives. This being so, any instruction and practical information received in their childhood days will be of some material benefit to them in later life. For the purpose of giving such instruction the Horticultural Club was organized some four or five years ago. Horticulture is but a division of agriculture—the former being the art of cultivating gardens, the latter the art of cultivating fields. While some men devote themselves to horticulture only, it is probable that most of our farmers' sons will be taught that gardening is a preparatory school, so to speak, for farming, and having learned some of the principles which control vegetable and plant growth, the best methods of cultivation and of fertilizing, they will be enabled to apply these principles to the broader field of agriculture when they become older. With the hope that what information we might be able to give would aid them, this Club was organized, and if we shall succeed in interesting the young in some of the topics which pertain to gardening or farming, we shall be glad. Besides this, we aim to give interesting stories, puzzles, etc., so that all may find something in this page to benefit and interest.

There are now nearly a thousand members of the Horticultural Club, whose names are enrolled on our books. We invite all farmers' boys and girls into whose hands the RURAL falls to send us their names, as that is all that is necessary to secure a membership and entitle them to the Youths' Seed Distributions whenever they are made. A word as to this. Nearly every year we have seeds of rare plants and flowers in quantity not sufficient to supply the large number of subscribers to the RURAL, so that it is our custom to give the children a chance, though on a small scale, to experiment and thus put into practice what lessons in the cultivation of plants and flowers they may learn from our pages or elsewhere. With this purpose in view the Horticultural Club exists, and each member should be desirous of making it mutually interesting and profitable.

UNCLE MARK.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—My little sister Eula May wrote you a letter and you sent her some seed when you sent Uncle Johnny's, and they are growing nicely. Ma says we both can write this time, and ask for a few of the Insect Powder Seed, that she will take great pains with them and report for us. We have such a pretty yard it would make the letter too long to tell you about it. I wish you could see our wild flower bed, there is always something now in it that we had not found before. Don't you think everybody ought to have one in their garden? I would like to tell you about our water lilies, and how mamma saves her flowers. Last Winter while almost everybody lost theirs or part at least, mamma did not lose any.

Cool Springs, Ga. OSCAR AND ECLA MAY.

[Certainly, let us hear the secret of your mother's success in wintering flowers. U. M.]

UNCLE MARK:—I have not time to write much, but I want to tell you what our grape seed are doing. We planted them last Spring, but only two came up, of which only one lived. This Spring seven more came up, four of which are still alive, but a little black insect, so small that I can't well tell what it is like, is killing them. The ants are working on the insects, but they seem to multiply too fast for them. The Horticultural Club at our house all thank you for seed sent this Spring. We have carefully planted them, will cultivate in a proper manner, and will send the leaves and flowers of the Japan Red Bud if we succeed with them.

Caldwell, Tex. VIRGIL A. HERRON.

DEAR UNCLE MARK:—You must think by this time that I have deserted you, but not so. I received the seeds all right, for which please accept my thanks. I shall try to do my best to give you a good report of everything. I am now living at Corunna, which is a very pleasant place. We have four flower beds this year. I have some seeds, just started to grow, of a Southern tree that I don't know the name of. I will send you a sprout when it gets large enough.

Corunna, Mich. HENRY WELFARE.

DEAR UNCLE MARK:—I have long wanted to join the Club. My sister takes the RURAL. I am eleven years old and the youngest of the family. I have a few flowers but no plants among them, and mamma has a great many beautiful roses and a lovely hydrangea. If you give this a place in the dear old RURAL I will write again and tell the cousins something about my pets. Your affectionate niece, WEETA M. RICE.

Abbeville, La.

UNCLE MARK:—I read in our last RURAL that you had some Pyrethrum seeds yet, so you may send me some, if you please. Only one plant of the Japan Red Bud came up. It is growing nicely and is a beautiful plant. Some of the pinks that we raised from the RURAL seed are budded. Please accept thanks for all the seeds.

Keepville, Penn. HELEN A. RANDALL.

Sabbath Reading.

[For The Rural New-Yorker.]

AFTER.

AFTER the night of darkness
Cometh the light of day;
After the storm is over,
The shadows will pass away.
Never a day so gloomy,
But some ray of light shines through,
With promise of golden sunshine
And skies of azure blue.

We cast the seed in the furrows,
Hoping to reap the grain;
Trusting in Him who has told us
We shall not sow in vain;
Then, after days of waiting,
The tiny plants appear,
The blade and unfolding leaflets,
And then the "full corn in the ear."

The flower yields its sweet perfume
After wet with the morning dew;
And sends up its grateful fragrance
Each day to its maker anew.
The bird that sings most sweetly,
Has sometimes the saddest strain,
But the cheeriest notes of the robin
Ring clearest after the rain.

After our trials are over,
For us comes a morning bright,
With never a cloud of sorrow,
To again obscure the light;
On the other side of the river,
Where all shall be "made plain,"
We'll see, how 'mid earth's trials
There never came one in vain.

Let us wait in patience the dawning
Of light on the other shore,
Where sin is forever banished,
And sighing and tears are o'er.
How sweet in that glorious after,
To dwell in a world of light,
With all the redeemed forever
"Who walk with the Lord in white."

We now "see through a glass but darkly,"
And our human faith is dim,
There, with clear, unclouded vision,
We will be "face to face with Him,"
The dear Saviour who purchased our pardon,
With Jesus the crucified:
We'll wake to the heavenly likeness,
And our souls shall be satisfied.

CONFIDENCE IN GOD.

When the author of the Hebrews wrote the text (Chap. x; 35), this was what he had immediately in mind. Cast not away your confidence in things unseen—in God, in Christ, and in religion. Religion is a universal fact; it is peculiar to no race or age or civilization. Dogmas differ, sects vary, ordinances change; some religions are better and some worse; but man believes not only in the life that now is, but in that which is to come. A strong faith in the unseen world, in immortality, in retribution, is essential to man's greatest power and highest happiness. An atheist looks out upon a future as cheerless and lifeless as the frozen ocean. What can strengthen and warm his heart? Even the despairing Carlyle said, "A man's religion is the chief fact with regard to him."

Some will say that nothing more is needed than confidence in God. They will enlarge upon the weakness of man, and dissuade him from trusting in man's power. They will quote the psalm, "All my springs are in thee." This is merely a question of words. No man is strong in God until God has come into him. He is strong with God's might in his inner man. There are two ways of looking at the subject. Paul states them thus:—"Work out your own salvation, with fear and trembling, for it is God that worketh in you, both to will and to do His own good pleasure."—President B. A. Hinsdale, of Hiram College.

You may be nearer to Christ than you think. Those men who went stumbling along the road to Emmaus, weeping and mourning that their Christ was gone, poured into His very ear the tale of their bereavement. They told Him of their trouble—that they had lost their Christ; and there He was talking with them. In the midst of their great grief there was their Victory, and they did not know it. There is many a man whose misfortune is the occasion of Christ coming nearer to him. There is many a man in embarrassment, overwhelmed with care, who does not know what to do. It is the pressure of God's hand upon him for the purpose of betterment. It is God present in His affairs; Christ near to him for the sake of winning him to Himself.—Watchman.

LOVE Him that first loved you, and while you sink into his arms, and surrender all to Him, with a joyful, absolute self-renunciation, let this confiding love swell and abound, till every figment of distrust shall be swept away. For against every challenge, in time or eternity, this may be your rejoinder, "He that spared not His own Son, but delivered Him up for us all; how shall He not with Him also freely give us all things!"—J. W. Alexander.

THE grass of the field is better than the cedars of Lebanon. It feeds more, and it rests the eye better—that thymy, daisy-eyed carpet, making earth fair and sweet and home-like. Kindness is the turf of the spiritual world, whereon the sheep of Christ feed quietly beneath the Shepherd's eye.—Faber.

GOD never forgets or forsakes us; it is we who wander from Him. Like the earthly parent waiting for the repentance of an erring child, so He waits with a holier love.

No sense in having sickness in the family if you will use Hop Bitters in time. Ask those who know.—*Adv.*

PERSONAL ITEMS.

President Lincoln's widow is able to take drives and is likely to recover.

Secretary Robert T. Lincoln has been invited to deliver the address at the coming Vermont State Fair.

The Minneapolis, Minn, Tribune thinks it worth while to say that the name of Mr. Villard, of railroad fame, is pronounced Vil-*lard*.

Mr. Vanderbilt is said to have expressed a purpose of devoting to benevolent objects all of Maud S's earnings on the turf this season.

The Earl of Rosebery, at his rent audit, remitted fifteen per cent. on the half year's rents due at Lady Day from the tenants on his estates at Mentmore.

Just as soon as his haying is finished Ex-Governor Seymour expects to invite to a picnic on his Deerfield farm a hundred little orphan girls from a Utica asylum.

The handsome fountain presented by the late Mr. George Armour of Chicago to Campbelton, Argyleshire, of which he was a native, was completed and handed over only two days before his death.

The Empress Augusta of Germany is a woman of great courage and patience. For many years she has suffered tortures of intense pain from a wearing disease, and has borne it with a remarkable firmness, energy and quietness.

Lord Kimberley has turned land reformer, and is in favor of the abolition of all laws impeding the free distribution of landed property. He can easily take a leading position in such a reform for he is the owner of 11,000 acres, which yield a rental of £25,000, or $125,000, per annum.

[Springfield (Mass.) Republican.]

A Prominent Lawyer's Opinion.

In one of our New England exchanges we observe that Wm. T. Filley, Esq., of Pittsfield, Attorney-at-Law and Asst. Judge Police Court, and late County Commissioner, was restored to perfect health and activity, by the use of St. Jacobs Oil. He had suffered with rheumatism for years intensely; but by the recent use of the remedy he was, as stated, completely cured, and says the Oil deserves the highest praise.—*Adv.*

Miscellaneous

PYRETHRUM
Cinerariæ Folium,
THE GREAT
CALIFORNIA
INSECT-DESTROYING PLANT.

This celebrated plant has been pronounced unequaled as to its value and efficacy by any other production ever introduced on the American continent. Its growth and general use will eventually destroy all noxious vermin which infest the dwellings and persons of men and the domestic animals, as well as the insects which create such havoc with the products of the soil and of human industry.

Among the eminent scientists who have given the Pyrethrum exhaustive and thorough examination and trial may be named Prof. C. V. Riley, Chief of the United States Entomological Commission, and Prof. S. Henry Comstock, of the Agricultural Department, Washington, D. C.; Prof. A. J. Cook, Agricultural College, Lansing, Mich., and Prof. E. W. Hilgard, State University, Berkeley, Cal., all of whom unite in declaring it superior and infinitely surer and safer than any other insecticide ever offered to the public.

On receipt of $5 we will send a package of seed by mail to any address, with instructions for cultivating the wonderful plant from which our G. N. MILCO'S BUHACH CALIFORNIA INSECT POWDER is made. Each package will furnish plants for two or three acres. All orders for seeds must be sent to the

BUHACH PRODUCING AND MANUFACTURING COMPANY,
154 Levee Street, Stockton, California.

TRADE KIDNEY-WORT MARK
THE GREAT CURE
FOR
RHEUMATISM
As it is for all diseases of the KIDNEYS, LIVER AND BOWELS.
It cleanses the system of the acrid poison that causes the dreadful suffering which only the victims of Rheumatism can realize.
THOUSANDS OF CASES
of the worst forms of this terrible disease have been quickly relieved, in a short time
PERFECTLY CURED.
TRADE KIDNEY-WORT MARK
has had wonderful success, and an immense sale in every part of the Country. In hundreds of cases it has cured where all else had failed. It is mild, but efficient, CERTAIN IN ITS ACTION, but harmless in all cases.
☞ It cleanses, Strengthens and gives New Life to all the important organs of the body. The natural action of the Kidneys is restored. The Liver is cleansed of all disease, and the Bowels move freely and healthfully. In this way the worst diseases are eradicated from the system.
As it has been proved by thousands that
TRADE KIDNEY-WORT MARK
is the most effectual remedy for cleansing the system of all morbid secretions. It should be used in every household as a
SPRING MEDICINE.
Always cures BILIOUSNESS, CONSTIPATION, PILES and all FEMALE Diseases.
Is put up in Dry Vegetable Form, in tin cans, one package of which makes 6 quarts medicine.
Also in Liquid Form, very Concentrated for the convenience of those who cannot readily prepare it. *It acts with equal efficiency in either form.*
GET IT OF YOUR DRUGGIST. PRICE, $1.00
WELLS, RICHARDSON & Co., Prop's,
(Will send the dry post-paid.) BURLINGTON, VT.

OUR BRAVE **PRESIDENT**
A Memento of His Assassination.
An Elegant Engraving, Size 19 x 24.
Containing a splendid portrait of PRESIDENT GARFIELD and NINE PORTRAIT ENGRAVINGS OF HIS CABINET. With statistics of our national prosperity, education, Church and State. Various vignettes, two correct views of the obelisk in Central Park, and a unique historical engraving of **George Washington.** No description with the pen will enable you to form any idea of this beautiful work of art. It has been pronounced by all who have seen it as the most elegant and artistic piece of work of modern times. Some idea may be formed when we say that the artist's work alone cost over $2,000. FREE. Being the publishers of this beautiful picture, and wishing to present to EVERY READER OF THIS ADVERTISEMENT a Souvenir of OUR BRAVE PRESIDENT, we make the following liberal offer. For SEVENTY FIVE CENTS we will send the above described work of art and our elegantly illustrated HOUSEHOLD GUEST MAGAZINE, each number containing 48 pages of beautiful illustrations and choice reading, for six months for only SEVENTY FIVE CENTS. The price of the magazine is **$1.50 per year,** so we actually give you the engraving FREE. This offer is made for two purposes. First, to introduce our magazine into every family where it is not now taken, second, because it gives us great pleasure to be able to place such a souvenir in every American home. The price of the engraving alone has been fixed at **$1.00 per copy,** and it will be worth double this price. If, however, you want the picture without the magazine, we will mail it to you, post paid, for **50 Cents** in cash, or postage stamps, and money will be cheerfully refunded if you are not more than satisfied with your purchase. No patriotic citizen of any party should be without it. As to our responsibility, we refer to any New York publishers. Address all orders to **E. G. RIDOUT & CO., 10 Barclay St., N. Y.** (AGENTS WANTED.)

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

New Publications.

CLARK'S NEW METHOD FOR REED ORGANS.

This wonderfully successful book still sells largely, year after year, and seems to be a permanent success. A good instructive course, very fine selection and arrangements of good Reed Organ Music, account for the favor in which it is held. Price $2.50.

IN PRESS AND NEARLY READY:
a new book for Choirs, a new book for Singing Schools, } BY L. O. Emerson.
a new book of Trios for Female Voices. . . . . } BY W. O. Perkins.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XL.—No. 1645.} NEW YORK, AUG. 6, 1881. {PRICE FIVE CENTS $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Industrial Implements.

A SELECTION OF IMPLEMENTS FROM THE PARIS EXPOSITION.

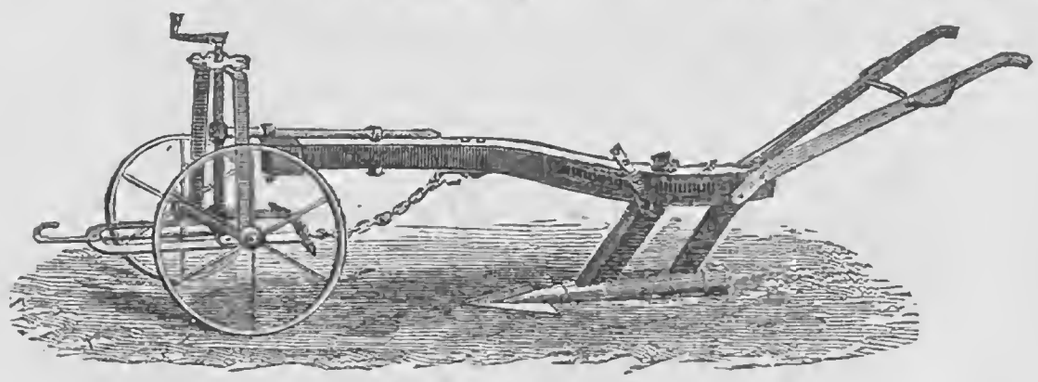
THE display of agricultural implements and machinery at the Paris Exposition of 1878 was unusually large and interesting. Edward H. Knight, A. M., L. L. D, member of the United States Commission at the Exposition and editor of the United States Official Reports, has just favored us with a copy of the illustrated report on agricultural implements, and from the great variety of exhibits therein represented we have selected and re-engraved for presentation to our readers, a few which either are not made in this country or have some peculiar features not usual in implements of the same class made here.

A MOLE PLOW.—Draining plows are constructed for either of two purposes—to make an underground passage for the water, or to excavate an open drain or ditch. Among us a plow constructed for the former purpose is known as a mole plow, from the round, tunnel-like channel it makes in the ground. The implement is not at all adapted for general use, however, as it will only do good work in strong, clay soils, and even there it does not always give satisfactory results, and it should not be used in the expectation of obtaining permanent drains; for where it does its best work the drains keep open only a few years, as they are apt to cave in from the top and sides and thus prove useless. For a poor man on the clay soil the use of such an implement may be advisable as a makeshift until the means for making a more substantial drain can be obtained. The accompanying cut, Fig. 370, represents one of several forms exhibited. The method of "working" the plow is evident, and in its passage through the ground it leaves a conduit of its own diameter for carrying off the water.

TRENCHING PLOW.—The other class of drain plows follow the ordinary plow and lift the subsoil to the surface, forming an open drain. In practice the subsoil to the depth of from 15 to 20 inches is thrown out upon the earth raised by the precedent plow. The trenching plow here illustrated, Fig. 371, is that known as Billot's plow, which is intended for cutting drains in natural prairies. The sloping cutter and the curved share cut the sod which is lifted and thrown in two equal parts, one on each side of the ditch. The plow has an ordinary coulter not shown in the figure.

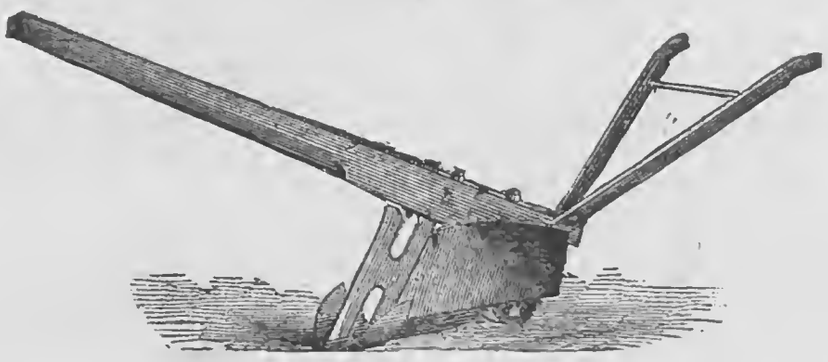
STEAM DRAINING PLOW.—The plow shown at Fig. 372 is a steam draining plow, which is used either as a mole plow or to put in pipes, and it may be worked to a depth of 42 inches. It is worked by a winding engine and rope, and when the wire rope passes over the pulley the speed of the plow, at great depths, is only half what it would be were the wire simply connected to the front of the carriage, while the speed of the engine remains the same. The price of a machine like this in Europe is about $250; here the owners of large farms could well afford one, or several owners of smaller farms, each contributing a part of the price, might profitably obtain one for their own use, and to be hired to their neighbors.

SHEAF BANDS.—Of the numerous forms of sheaf bands exhibited, Fig. 374 represents a hand band composed of two cords knotted together, forming loops, and tightened round the sheaf by means of a stick furnished with a handle, shown at fig. 3. The point of this tool is introduced through a loop at or near the end, and is thrust as far as the hand permits, as shown at fig. 2. The band being then pressed around the sheaf, the point is again thrust through the other loop, and the handle end of the stick is then carried over, describing an arc of a circle on the point which has sunk into the sheaf. The first loop slips down the handle to the pointed end, and the loop B, caught there in the notch, is drawn through the loop on the stick, which is then withdrawn, allowing the knot to be drawn through to catch on the loop, held by the swelling of the sheaf. These cords are five feet long, and in France they cost from $5 00 to $7 00 per 1,000, according to their thickness.



MOLE PLOW—FIG. 370.

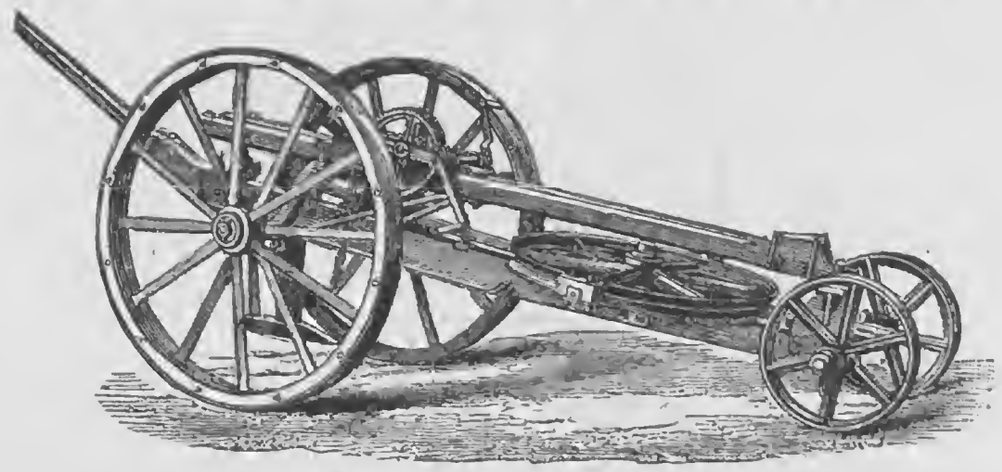
In economical France much attention has been given of late to substitute something else for the bunch of straw taken from the sheaf to form a band. It is estimated that the grain crops of that country amount yearly to 4,000,000,000 sheaves, and that 50 straw bands contain one franc's worth of grain; the whole representing 80,000,000 francs or about $15,000,000; most of which is lost by shelling out on the ground or mildewing under the band. Add to this the loss in time in making and applying the straw bands and the injury to the grain from the size of the bands which causes dampness in the sheaf, and the loss is formidable Of course, in this country where the grain crops are much greater, if only straw binders were used, the loss would aggregate much more. In France the peeled bark of osiers, two or three strips twisted together, and hempen strings, are the chief substitutes used. One of the latter kind exhibited had a string attached to a block and after passing round the sheaf it was rove through a ring, as represented at Fig. 376. The mode of using it is evident from the engraving; the wooden block being held in one hand, one knee of the operator is placed upon the sheaf to compress it, while the other hand draws the cord through the ring. The expansion of the sheaf pinches the cord between the ring and the block and makes a perfectly tight fastening. The cord and block are treated with tar and are smoked to render them indestructible by dampness and disagreeable to insects and vermin, so that they can be used in many successive seasons. The price is about $14 per 1,000. In Europe where cereals are dear in comparison with their prices here, it pays to save any avoidable waste; while the comparatively low price of labor renders it economically possible to expend a considerable amount of work in making small savings, such as that of the grain mildewed or lost by straw binders as well as the preservation of the cord binders from year to year, which can be done the more readily inasmuch as a great deal of the grain is still thrashed by hand.



TRENCHING PLOW—FIG. 371.

TREE SEED PLANTER.—The planter, Fig. 373, is a sheet-iron tube, with an enlarged bell-shaped mouth at the upper end and a sharp iron spud with a steel point which is thrust into the ground. The seed is dropped in the tube by the left hand. It is designed for the seed of trees, such as acorns, pine and birch seeds, and also for beet seeds which cling and do not run freely in an ordinary piston-feeder.

HAND PLANTER.—The planter, Fig. 375, is designed for small grains and for other seeds that run freely, such as some kinds of tree seeds, beans, peas and garden seeds that are planted in detached hills. Like the former, it consists of a tube and lance-shaped spud; but it carries the seed in the tube, the upper end having a cover, and the seed is discharged at a point near the lower end. Pressure on the piston, which projects above, opens a valve and permits a certain quantity to escape. It is used with both hands and the stroke of the plunger rod is adjustable to regulate the extent of valve opening and to limit the amount of seed discharged at each impulse.



STEAM DRAINING PLOW—FIG. 372.

Horticultural.

RAYS.

YOUR correspondent "C. E. P.," page 466, speaks of the Rough-leaved Deutzia (D. scabra) so plausibly, that many may be inclined to consider it as a common shrub, whereas the fact is that there are very few scarcer shrubs in cultivation. I know it is advertised in many catalogues, and plants are sold for it, but in every instance that has come under my observation, D. crenata, and not scabra, was the species handled. If "C. E. P." is satisfied he has the true Scabra would he please tell us regarding its distinctness from Crenata?

* *

SCHOOLS for female farmers (page 470) are not what we want in America. Out-of-door farm work or any other legitimate employment is no disgrace to a woman any more than to a man, but our wives, our sisters and our daughters can find more becoming work inside than outside. I believe in educating women as thoroughly as men—not for ornament but for use, and there is no work so honorable for women, in my estimation, as housework. School-teaching, shop-tending, factory work and the like may be good enough as a means of subsistence, but surely no woman can regard such work as the climax of her ambition. Do not all women yearn for a home of their own, and when they get it how can they enjoy it unless equal to the task of caring for it. American women throughout have a business inclination, are intelligent and educated, and those brought up upon a farm have an inborn knowledge of its working, so that should an emergency occur they need but little prompting in its management.

* *

I HAVE had some experience with women as farm hands, and fully appreciate their value in that direction, but out of consideration for the women themselves I disadvise their employment in the field except in the interest of of their own families; then it is often their duty. Many a day of my boyhood have I worked in company with the women in the field, cleaning land for crops, putting out and spreading manure, carrying seed to the sowers, harrowing, planting potatoes, hoeing and storing potatoes and turnips, haying and harvesting, milking and the many other kinds of light work incidental to the farm and for which we found women more enduring than boys and more nimble than men. Again in nurserywork, behold how useful women are, still I do not like to see them at it. In my earlier years I was employed in large nurseries where firs and larches were grown by the million, and other trees and shrubs in proportion, according to the demand. The seeds were sown broadcast in long, narrow beds which were cleaned by weeding only. The weeding was all done by women; they were more expert at it than men and more particular than boys; they also did the light hoeing, counting plants, etc. In the Fall and Winter they went into the woods and lanes for miles around to gather cones, acorns, elm and other seeds, which they carried to the nurseries upon their backs, and we bought them from them by measure. Those women seemed happy and contented, but that ambitious nature, progressive intelligence and domesticated capacity so visible in the women of to-day were greatly lacking in them,

* *

GARDENING is peculiarly woman's outside sphere; she takes a pleasure in it; it does her good—mind and body. It is not labor but exercise. It has an elevating influence upon herself and family and, too, upon the neighborhood. It induces in the community that noble contention or rather emulation of who the most and prettiest flowers can grow, and who

can have the sweetest and most cheerful homes.

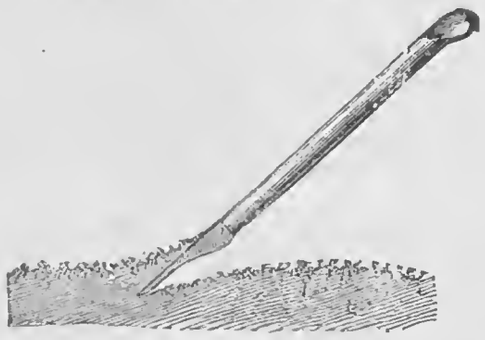
* *

In the London Garden an artist speaks of the Lombardy Poplar thus: "The repetition of straight line is what you want. I think, too, for an avenue or for a line of trees by water, the Lombardy is not easily beaten." Perhaps not, but of all the homely, ungraceful and uninviting trees styled "ornamental," I think this one of the most objectionable. I had a run through the State of Maine some weeks ago, and saw many old trees of this poplar about the farm houses and roadsides along the Androscoggin Valley, and mostly all were in a more or less dilapidated condition. It added neither beauty nor character to the landscape, shade nor ornament to the homestead, nor by its wood was it useful in any way. No one spoke of it in love or sympathy. One farmer "guessed" that as it grew so tall and slim, a mile of them might be raised upon an acre for pulp-wood, and in that way be worth something. LEON.

N. J. NOTES ON TREES AND BERRIES.

The Aquilegia bloomed very nicely; some of the flowers are quite large and finely shaded in color; about half of the plants gave double flowers.

The Japan Maple, Polymorphum, was killed to the snow line. The plant was about five feet high and was killed to fifteen inches of the ground. The Double White Deutzia crenata is also killed in the same manner.



HAND PLANTER FOR TREE SEED.—FIG. 373.

The Japan Retinosporas of the following varieties passed the Winter unharmed:—

Aurea is now tipped with its golden new growth, and is a thing of beauty. Argentea is of slower growth, yet equally beautiful, showing silver foliage. Leptoclada, dense in growth, pyramidal and clothed in beautiful green. Obtusa is hardy, of straggling growth and rather a nice tree; it looks like the Arbor-vitæ. Squarrosa is of rapid growth, upright, and very nice, of light-green color—a pretty tree. Aurea and Argentea turn green in the Fall and Winter. [The Aurea does not with us. Eds.]

The Thujopsis borealis, Douglas and Nordmann's Firs should be more common. The Spanish Chestnut is not hardy according to my experience. Of 200 small trees all are gone and of some bought last Spring there is only one tree that is not killed to the snow.

Strawberries were very nice this year. Among the newer berries Miner's Prolific is truly a great cropper of fine berries; size large, and moderately firm; flavor deficient—the last being the weak point of this berry otherwise among the best. Glendale and Continental did not do well for me—not productive. Cumberland Triumph, Sharpless and Kentucky are among the best. Great American is fine, when the ground is rich. Durand's Beauty is fine for hills, making very few runners. It is productive and high-flavored.

Peaches are an entire failure here; the trees were considerably injured by Winter; but they are looking unusually well at present.

Pears are looking well. Bartlett gives a good show for fruit.

Apples of the Smith's Cider variety present a fair prospect for fruit—not much else.

I. J. B.

GLASS.—All who are fond of the companionship of growing plants, and who have some leisure to attend to their few needs, and find solace or pleasure in the occupation, have no aid of more service than the shelter of glass. A little glass room, or greenhouse, gives, of course, the greatest advantages, but a mere sash or hand-glass or a fruit jar inverted—or, better, bottomless and covered when necessary by a broken pane—is often the means of saving plants that would otherwise perish, or at least lose their beauty. The glass, while admitting light, incloses an artificial atmosphere always somewhat warmer than the exterior air, and usually moist from retaining the vapor evaporated from the leaves or the soil. But the heat may become excessive, and the air may become so dry that the leaves will burn, or be eaten up by the red spider; so any one undertaking to use glass, must be on hand daily, especially when vegetation is young and tender in the Spring, to change the shading or the ventilation with the changing influences of sun and wind. Many plants, including grapes, will endure great heat if the air is moist enough to prevent the leaves from scorching: others require, at least while young, to have the glass shaded during the heated term. Lettuce which is brought forward in quantities under glass, requires both vapor and screen when the sun shines out strongly. When upper and lower ventilation is given at such times, the air that enters absorbs vapor as it warms, and carries it out as it leaves by the upper openings. This is apt to make the inclosed atmosphere burningly dry, and must be counteracted by occasional syringing, or by reducing the ventilative airflow unless the plants require hardening, when the flow is essential.

A cave or cellar, fronted with glass towards the east or south, is the best provision for sheltering half-hardy plants, shrubs, roots etc. in our climate. The door-way should enter on a level from an area on which the plants can be placed or planted out when the weather becomes genial, and from which they can easily be taken in, in September or later. W.

Small Fruits.

THE CUTHBERT RASPBERRY.—The RURAL asserts, on page 486, "that the Cuthbert is at once the highest flavored, largest and most prolific and hardy variety of red raspberry known. As to the latter quality it may be so, but in regard to "flavor," I have never found anything equal to the Herstine; and in size it is as large as any. The only objections I know to it for general cultivation are that the berries are too soft for shipping any considerable distance, and the canes require to be buried in Autumn to preserve them from being winter-killed.

THE MANCHESTER STRAWBERRY.—I am of opinion it required just such a cool, wet season as the past May and June were, to grow this berry satisfactorily in a sandy soil as is represented. In an ordinary or very dry season, I doubt whether it will do better on such ground than the Wilson and several other varieties. These latter have borne infinitely better with me on a very light soil this season than they ever did before. A. B. ALLEN.

Gooseberries.

MR. PECK sacrificed his half dozen gooseberry bushes as more of a plague than profit, as told in a late RURAL p. 473. Here on the contrary, everybody seeks to plant some, Downing's and Smith's and Houghton being the favorites. It has been suddenly and generally found out how piquantly delightful a sauce they make while quite green and thin-skinned, when we are tired of rhubarb, and before strawberries come. They are the easiest of things to keep, too, in jars or bottles. At that stage they have nothing of that harsh, unpallatable acidity of skin which sugar falls to mollify, that makes them barely tolerable when ripe. G.

A Backsliding Thorn Tree.

MR. Y. WHEELER of the Unadilla Valley, N. Y., grafted a thorn bush several years ago with a nice pear cion. The tree grew finely and one year produced quite a crop of most luscious pears. The effort exhausted the better nature of the tree, however, for it never bore another pear. Instead, huge thorns came out here and there upon the branches, and at last Mr. S. grafted it again with apples. I shall watch the refractory tree with interest for further developments. E. J. R.

SAWDUST MULCHING FOR STRAWBERRIES.—A few weeks ago the RURAL requested any of its readers who had mulched their strawberries with sawdust to report the result for publication. I mulched a part of mine with sawdust this year, and I am satisfied it is worthless for that purpose. It takes a long time to dry and the berries are badly rotted by lying in it. The Cuthbert Raspberry was uninjured last Winter except a little at the tips. The RURAL seeds are doing nicely, especially the flower seeds.

Factory Point, Vt. "WALLACE."

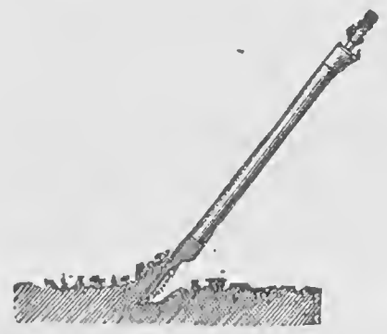
A WELL-KNOWN horticulturist remarked to us that there is a greater variety of fine specimens of evergreen and deciduous trees and shrubs in Prospect Park, of Brooklyn, L. I., N. Y., than in any other one place in this country....

Field Crops.

THE CULTURE OF CORN.

Mr. H. Stewart's Reply to Dr. J. B. Lawes, of Rothamsted.

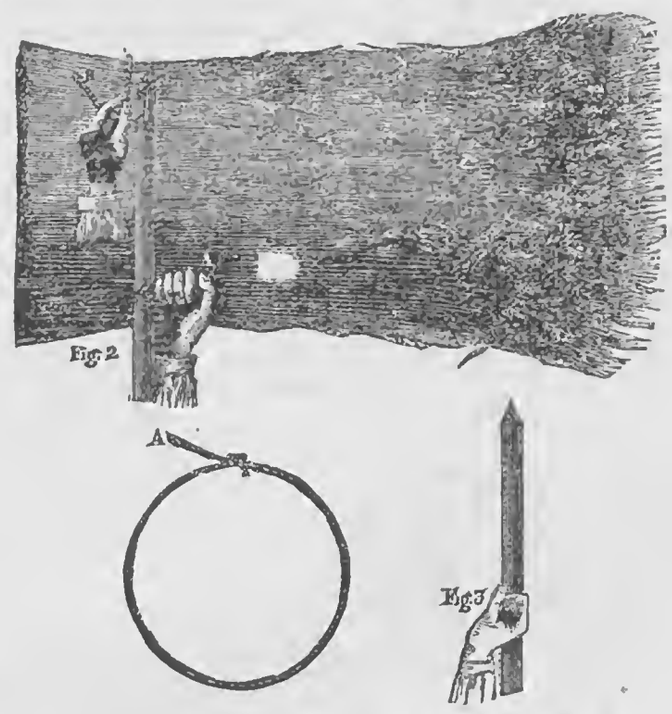
WHEN I complied with the request of the Secretary of the New Jersey State Board of Agriculture to give him my views upon the culture of corn for publication in the annual report of the Board, I little expected that



HAND-PLANTER WITH PISTON-FEEDER.—FIG. 375

it would bring me into conflict with the world-renowned agricultural chemist and experimenter, Dr. J. B. Lawes. But that I feel some confidence in the truth of my views and perceive from my point of view that they do not conflict very much, if at all, with those of Dr. Lawes, and that he may, perhaps, miss some important element in this question through want of familiarity with this especially American crop under its special characteristics in American fields, and under some special conditions, I should scarcely care to discuss this question under the certain disadvantages which Dr. Lawes's greatly superior position throws upon me. I would take this opportunity of acknowledging very gratefully the obligations under which, in common with the many American admirers and students of the Doctor, I have been placed for the fund of information derived from his elaborate experiments and his life's work. We can never too highly appreciate the services he has conferred upon American agriculture, and I am not without some hope that perhaps we, in America, may some day be able to add something to the great mass of information which has been gathered up at Rothamsted, through our investigations here, under somewhat different circumstances of climate, soil and crops.

On careful study of Dr. Lawes's communication [see RURAL NEW-YORKER of July 2], I must confess that I fail to see any serious point of difference between his views and mine in regard to this question. I don't wish to discuss it in regard to wheat, because I have not given so much attention to wheat growing as to corn growing, and confess that, so far as regards the former crop, I have not yet been able to produce it here so cheaply as I could buy the Western grain; and I doubt very much if we Eastern farmers can compete in wheat production with the West any better than the English farmers can. But I would like to say that I do not think it depends altogether upon the supply of nitrogen in the soil; that it is not so much a question of fertility as of cheapness of culture. Here in the East our lands cost too much, and our farms are not large enough for the use of the labor saving implements and machines, so that the cost of a crop of 40 bushels of wheat per acre even is not repaid by the price fixed by the cost of the smaller crop of 18 or 20 bushels grown in Minnesota or Dakota. The very same difficulty exists in England as regards this crop. But with regard to corn this difficulty is greatly lessened. Corn cannot be grown and harvested as cheaply as wheat, in the West. The Western corn must be cut and shocked and husked by hand, and at the same cost as in the East, so that the relative disability of the Eastern farmer is not so great as in the case of wheat. It is, therefore, wholly a question of fertility with corn, while the element of labor enters into the question as regards wheat to the greater detriment of the Eastern American and the English farmer. Then, if the cost of the artificial fertilizer required to produce a bushel of corn in New Jersey is less than the freight on it from Chicago, I hope to be able to compete successfully with the Iowa and Illinois farmer in growing corn. It rests wholly on this point, and in my paper referred to by Dr. Lawes, I made this my chief point.



HAND-BINDING STICK AND BAND.—FIG. 374.

My experience in this respect has been limited to a few years, during which I have been growing corn repeatedly with artificial manures. I am not in a position to say how much nitrogen is naturally contained in my soil, which is poor and had been badly farmed by former owners, but I suspect it is very little. The nearest approach to a knowledge in this respect is the fact that on part of a field planted with corn and left without any manure or fertilizer, the crop produced did not bear one sound ear; there were some small stalks and poor nubbins, but not one good ear on a strip four rods wide through the field. This field (two acres), manured with 600 pounds of the Mapes' Corn Manure (containing 23½ pounds of nitrogen) per acre, gave me 98 bushels of shelled corn, containing about 88 pounds of nitrogen, per acre. A plot of one-sixth of an acre in another field, manured in precisely the same manner, gave 25 bushels and 8 pounds of shelled corn, equivalent to 150 6-7 bushels per acre. Here was presented a serious problem, and one upon which, it may be easily perceived, depends a most important sequence for the Eastern farmers, who are confronted with a harrassing, if not ruinous, competition with Western farmers. This, with some repeated crops, not grown experimentally, but in ordinary farm work, make up the sum of my personal experience.

With this there are many similar experiences of others, reference to which may, perhaps, go no farther than the crops grown on the Rural Farm, a large number of experiments collated by Professor Atwater, and several competitive crops grown by farmers and farmers' boys. These all showed a large product grown with totally inadequate nitrogenous manuring, and

SHEAF-BINDING BAND AND BLOCK.—FIG. 376.

some of them showed a seriously injurious effect from an excess of nitrogenous manures. Now there seems to be but one explanation for these facts, and that is that corn is able to avail itself of a supply of nitrogen from some occult source when it is sufficiently provided with potash and phosphoric acid. What this source is I do not attempt now to question. The corn gets the nitrogen, that seems certain, and I infer, from Dr. Lawes's communication in the RURAL NEW-YORKER of July 2, that he and I do not differ in the least as regards this bare fact. For he says, "The only manner in which such a result, viz., that a quarter of a pound of nitrogen in manure will produce a pound of it in corn, might possibly be arrived at, would be by the continuous growth of corn by means (1) of a mineral manure alone, and (2) by the same manure combined with salts of ammonia, if this were done with very great care and for a sufficiently long period." Further he says, "more nitrogen would be recovered by the corn than by the wheat."

Now if I have said any more than what this purports to mean, and Dr. Lawes will allow me, I will withdraw all beyond that, and rest my case upon it. That includes every point I wish to make, for the whole sum of my argument is that the Eastern farmer, by the perfectly right employment of a quarter of a pound of nitrogen, can recover one pound of it in his corn crop, if he will only give enough potash and phosphoric acid. In discussing the question of the culture of corn in my paper I considered it solely in its practical bearings, and did not give much attention to its relative character as compared with clover. But if the above admission of Dr. Lawes is correctly quoted, it certainly seems that it must also be admitted that "corn should not be placed on the list of grain crops which require to be supplied with a surplus of nitrogen, but, rather, classed with clover and the leguminous crops which yield larger quantities of nitrogen in their product but require an inconsiderable supply." And why not? Consider the season

of growth and of the maturity of corn. It occupies a period of the year marked by numerous thunder showers and a torrid temperature, when the production of nitric acid is known to be greatly in excess of that at any other season, and probably, if not certainly, greater than the product of the whole of the rest of the year; while wheat is mature and ready for harvest before the hot weather fairly begins. Corn, in fact, is a tropical plant, and cannot be justly compared with wheat, oats and barley, which thrive in the cooler parts of the temperate zone, and is, therefore, as Dr. Lawes admits, "less dependent upon an artificial supply of nitrogen than wheat, oats or barley." Now wherein do we differ in respect to the character of corn as a gatherer of natural nitrogen? I have read with great care all that Dr. Lawes has written in criticism of my paper, but I leave it with the satisfaction of believing that Dr. Lawes really agrees with my views; or I would rather say that my views appear to be based on a true understanding of Dr. Lawes's teachings, to which I confess I am indebted for the most of my opinions and beliefs on this subject. I disclaim any desire to stand in the relation of a disputant with Dr. Lawes: I rather claim the relation of a disciple, and recognize him as my apostle and authority in this investigation, and shall rejoice if it may induce him to study still more closely the subject of American corn culture, in connection with our peculiar climate, and our enforced necessity for mineral fertilizing, with continuous cropping to a great extent.

In conclusion, I would say that I am much pleased to have so favorable an opinion in regard to the permanence of mineral fertilizers from Dr. Lawes, when he says that "phosporic acid and potash enter into fixed compounds with the soil and are only recovered over long periods of time." American farmers can scarcely have any more encouraging evidence of the permanence of artificial fertilizers than the fact that at Rothamsted the potash and phosphoric acid applied 30 years ago are still showing their effects upon the crops. In my attempts to grow corn continuously, and chiefly with artificial manures, I have already had evidence of the same fact; and if the most costly ingredient of these fertilizers, viz., nitrogen, is required only in the small proportion admitted by Dr. Lawes, I can see my way clearly to grow corn cheaper than I can buy it from Western farmers, and either feed it in my dairy or dispose of it at a profit.

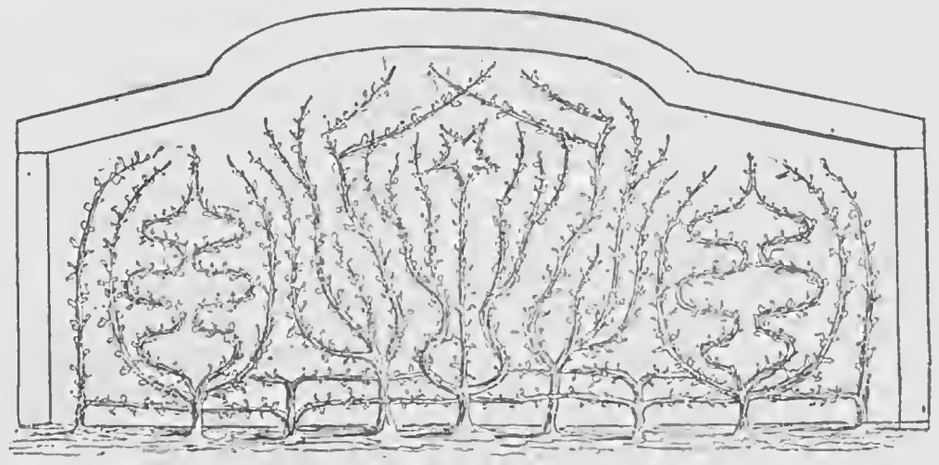
TOBACCO GROWING NOTES.

It may be safely affirmed that land can hardly be manured too highly for tobacco. Yet we sometimes hear complaints of positive damage to crops from too much manure. This is only the case when the manure is very coarse and the season is dry. The combined influences of dry weather and a large amount of coarse, unpulverized manure are destructive to a large growth of plants.

With corn and some other hoed crops it is sometimes impossible to have a full stand of plants. Insects of various kinds cause "missing" hills until it becomes too late for replanting. With tobacco, however, it is different; there is little excuse for "missing" plants, and where vacancies are found, it is pretty good evidence that the planter is a careless grower or one not experienced in the business. All that is necessary, in the majority of cases, to secure a full stand, is to set, at the time of planting, enough extra plants to fill vacancies that may appear later in the season. It is best and safest to re-set from the plant-bed for a time or until the first plants have commenced to grow, after which the "extra" plants should be used. If the work of re-setting is done in damp weather, when the soil is moist, and the plants are removed with a ball of earth upon the roots, they will bear removal without apparent injury, and a perfect and even stand of plants may be effected.

A full stand of plants is always very important to the outcome of the crop. A full yield cannot be expected in fields where there are "missing" hills, as is often the case where care is not exercised to make the stand perfect. The labor of cultivation and manipulation is almost as great where a percentage of hills are missing, as the ground must be passed over just as often as when every plant is in, and the loss from the "missing" hills is apparent.

It is now time for the tobacco fly to make its appearance. It is well to watch for the pests and to adopt some method for their destruction. The Jamestown-Weed (Stramonium) which is common in a wild state in many parts of the South and West, forms a useful medium for destroying this insect. The blossoms, which are eagerly sought after by the fly, should be charged with a solution of cobalt or other poison, and the fly is destroyed. In the North where the Jamestown-Weed does not mature early enough, the flies are sometimes killed in large numbers by keeping fires —torchlights—burning in and about tobacco fields during the night time. The moths are attracted by the lights and are destroyed either by the fires themselves or by attendants. But no care on the part of a planter can prevent the appearance of the larvæ of this tobacco fly in a greater or less number, and the utmost vigilance is necessary to prevent them from causing serious damage to the crop. Worming should begin as soon as the first one is seen, and the work should be thorough or



ORNAMENTAL WALL-TRAINING—PEACH WITH APPLE CORDON IN FRONT.—FIG. 377.

those that are not destroyed will cause much harm. The eggs of the larvæ can be found by a careful eye, and it is well to keep a sharp lookout for them also.

Late tobacco can be hastened to maturity by watering the plants with liquid manure. Water from the barnyard—leachings from the manure—is as good as anything for the purpose. It is best to apply it in cloudy weather or just previous to a rainfall, as when the soil is dry and the weather bright and hot, it is likely to cause the surface soil about the plants to bake, when composed in large part of clay. Next to this there is nothing that will promote rapid growth and early maturity better than constant cultivation. G. G. JR.

Chemung Co., N. Y.

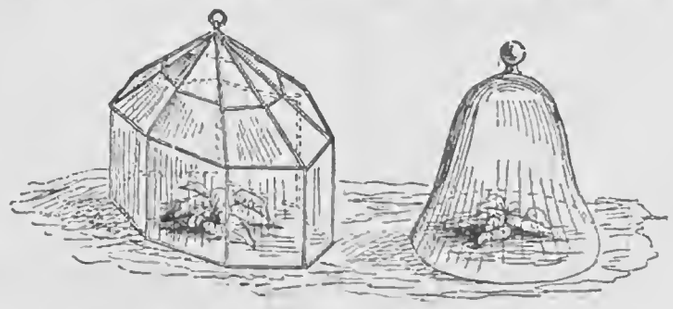
RURAL BRANCHING SORGHUM.

An Important Report from Texas.

It is with great satisfaction I state to the many readers of the Rural New-Yorker that the above sorghum is a perfect success in this latitude. Notwithstanding that we had no rains in June, it stood the drought without wilting in the slightest degree, while the corn in the adjoining row was yellow half way up the stalk. I can truthfully say I am repaid tenfold, in this one item of the Free Seed Distribution, for the price of the paper.

It was planted on the 28th of April, and on June 15 it was about eight feet high, with ten and thirteen stalks to the hill. It is assuredly a marvel of luxuriance and productiveness. If our kind Rural farmer would in future send our free seed a month or two earlier, it would greatly help the good work down South. [We have fully appreciated the necessities of the case and have always endeavored to send Southern seeds at the earliest day. But hitherto we have been unable to control the matter, owing to the fact that every succeeding season has brought an unexpected increase of labor. Again, in the case of imported seed, we are unable, in many cases, to procure them in time. Such was the case with the Dutch and Argenteuil Asparagus of our last Distribution. We look for no delays in our coming Distribution, for the reason that most of the kinds are growing upon the Rural Farm.—Eds.] Our corn is planted about the first of March, and if I had the sorghum seed at at that time I would have had an extra cutting for stock this Summer. On June 18 I commenced using it for feed, and will report progress if you think it will be of any interest to your readers. [Most assuredly it will.—Eds.] I may state it was planted in poor prairie soil, in my garden, without the application of any manure whatever. It has had but one plowing and one hoeing, but is free from weeds and grass. I have a very poor stand; the seed must have been at fault, for I planted it with all the care possible, while only one seed in twenty germinated. [That is our experience.—Eds.] If ensilage is a success, and it seems to be from the Rural writers, then we have found the coming fodder plant. G. G.

Texas, Latitude 30°.



FRAME AND BELL GLASS USED BY PARIS MARKET GARDENERS FOR YOUNG PLANTS.—FIG. 378.

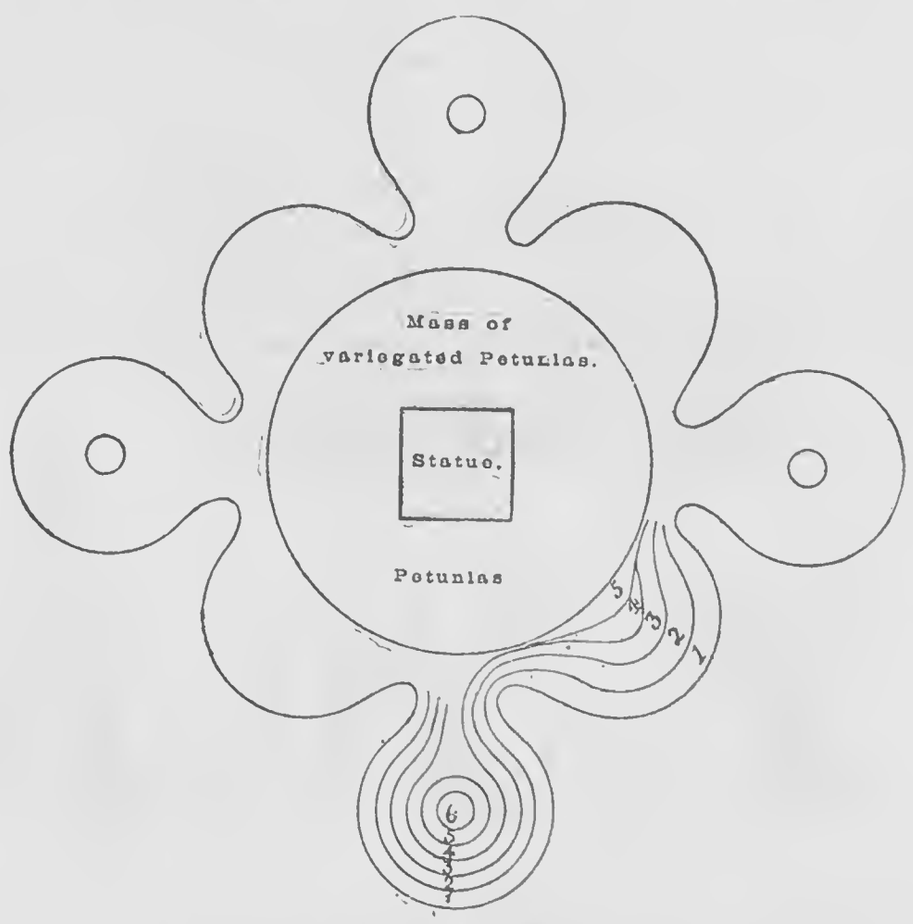
EXPERIMENTS WITH SEED POTATOES.

Carefully conducted experiments have repeatedly proven that the manner of cutting the seed has much to do with the yield of a crop of potatoes. Having been told last Spring that a great difference exists in the growing and yielding qualities of the stem and seed ends of a potato, I decided to prove the assertion correct or otherwise by experiment. I carefully planted and marked two rows of potatoes planted at the same time and in rows side by side. In one row the seed was cut in the usual way and two pieces planted in a hill. In the adjoining row the seed ends of the potatoes (the ends having numerous eyes) were first removed and cast aside and the remainder of the potato cut in the usual way and planted as above, two pieces in a hill.

Watching carefully the manner of growth in the respective rows, I noticed as soon as the potatoes were fairly up a decided difference in the foliage and stalks of the young growth. The row planted without the seed ends were of a deeper, healthier color, and the stalks also were much stockier. It was plainly to be seen that the row planted with the seed ends of the potatoes removed had the advantage of the other row planted with the seed cut in the usual way. The growth was stronger and larger in the former row as could be plainly seen several rods away. The treatment of the two rows from the time the seed was planted was precisely the same. London-purple was applied to the foliage as the bugs made their appearance, but the treatment was not sufficient, for enough bugs remained to test the strength of the plants. The row planted in the usual way, having a feebler growth of tops, suffered most.

When the potatoes were dug the same difference noted in the growth of the tops was visible in the size and yield of the tubers. Owing to carelessness on the part of a workmen the product of the respective rows was not measured, but it was plainly noticeable both in size and quantity of the tubers in favor of the row planted with the seed the seed ends of which had been removed. G. A. G. JR.

Elmira, N. Y.



GEOMETRIC BED AT THE PARIS EXPOSITION.—FIG. 379.

The Washington Oats.

What's in a name? I have grown the Washington Oats, and about half the yield is smut. Indeed I have grown the same oats for years, having got them from the Department of Agriculture first, and afterwards I bought a bushel from B. K Bliss & Co., of N. Y. City, under the name of English Challenge Oats. Having compared all, I know they are identical. After harvest I will send the Rural samples of a sort of heavy white oats imported from Scotland, and also of the Washington Oats. G. C.

[We should much like a quart of the heavy oats from Scotland sent by mail at our expense. We have the Washington Oats, as well as several kinds of English and Australian. They very nearly resemble each other.—Eds.]

Farm Economy.

GOOD DRAINAGE ESSENTIAL FOR WHEAT.

The past two or three years should convince farmers in this section that land sown to wheat in the Fall should be well drained. The Winter of 1878 was a very open one with considerable rain, very little snow and very mild weather generally, and the consequence was that we had considerable wheat. On low land that was poorly drained, however, it was water-killed while the crop on an average was very poor. Last year we had an unusually hard, cold Winter with considerable snow, and we had an uncommonly good yield of wheat. This year we have again had an open Winter with considerable rain, scarcely any snow and very mild weather generally, and the prospects now are very poor, the wheat having been considerably water-killed and injured by the fly. Hence I conclude that land, to produce the best yield of wheat, must be well drained so that the water will not stand on the wheat at all, either from a rain or from melting snow, as it seems to take very little water standing on wheat to kill it. Then it seems that where the land is plowed once, and the volunteer wheat is allowed to come up and the land is then plowed again, well harrowed and rolled, the fly does not injure the wheat so much. This has been the result for the last three years, and since these facts are known it seems to me that in order to raise a good crop of wheat the land should be plowed well and as early as possible after harvest, especially if it has been in wheat the year before. By plowing early the volunteer wheat has a good chance to sprout and grow, and the land should be plowed the second time to kill this well, and then harrowed and rolled before it is seeded, to get it as solid as possible before seeding it. It should also be well drained so that the surface water can all run off easily and as quickly as possible. With these preparations we can expect a reasonable harvest.

The Vineyard.

THE NIAGARA GRAPE.

To Mr. C. A. Green:—

Your reply to Mr. Suel Foster in reference to the Niagara Grape, in the Rural of July 16, should be given a wide circulation, because there is an inkling of truth in it that should have seen the light at an earlier date. Mr. Foster has probably declined the splendid offer of the operators for making an everlasting fortune. It is my (private) opinion that the Niagara Grape has *hung fire* too long for the good of the incorporators; and, as the

RURAL does not appear to be included in the list of those who have nothing but praise for a seedling that has been tested only in one place, perhaps the editor will allow me an additional word.

You mention three white grapes as before the public—the Niagara, Pocklington and Lady Washington. The first cannot properly be before the public until it has been tried in differing soils and climates. But when you speak of the fruit, I have tasted clusters of these varieties in their supposed perfection, and I must say it is an injustice to name the Lady Washington in connection with the other two. This grape, although somewhat lacking in spiciness, is a good dessert fruit, entirely free from the foxy odor so plainly and, allow me to say, so disgustingly prominent in the Niagara and Pocklington.

You remark that the Niagara may be good enough to sell well in the general market. Let me tell you that grape-eaters are growing yearly more exacting in their demands for good fruit, and the cultivators of really fine grapes are even now reaping their reward. Catawbas doubled on the price of Concords in the New York market last season. Good judges there report a continued inquiry for a better quality of grapes than the Concord and Hartford, while a dull, greenish-yellow grape like the Niagara is most unattractive, and the quality is *not* up to the *ordinary* standard. Between the Niagara and the Pocklington, with their sickening odor, there is the difference that the latter shows larger berries, more nearly golden, with a shade more of saccharine, although neither can serve the purpose of a wine grape, for which I understand the Niagara is now recommended.

Newburgh, N. Y. A. A. BENSEL.

The Herdsman.

NOTES BY A STOCKMAN.

WHEN a person undertakes to criticise another he should be sure he is right before he goes ahead. I am led to make this remark by reading the strictures of Sereno Edwards Todd on Mr. French's description of the cattle gad fly, Œstrus bovis. Mr. Todd is all wrong, notwithstanding his 50 years' study of this insect. He even convicts himself of error when he says in one place that the mature fly gnaws and nibbles a passage through the skin and in another place that the larvæ do the same thing. He says that the larvæ pass into the chrysalid state before the Winter, and that there is no orifice in the skin, etc. Further, he uses the following curiously incomprehensible sentence, viz., "After the chrysalid has become a fly, which is the parent insect, the fly gnaws and nibbles a passage up through the skin of the ox or cow, where it remains until it is fully developed." Now, after 50 years of study of this creature, Mr. Todd can perhaps tell us precisely where this "where" is located, where the perfect fly "remains until it is fully developed.

THE facts are that the larvæ remain under the skin, in the tumors which they cause, until late in the Spring and the early Summer; and that there is an orifice during the whole life of the larvæ in the tumor. The orifice may sometimes be covered by a sort of scab of dry pus, but there is a distinct hole in the hide and it is these holes which cause the tanners to grumble so much when they get together at conventions and pass resolutions against these very holes. The Chicago hide dealers who buy the hides of the cattle which are packed in the Winter in that city, have complained loudly of the damage, and deduct a certain sum for every wormy hide.

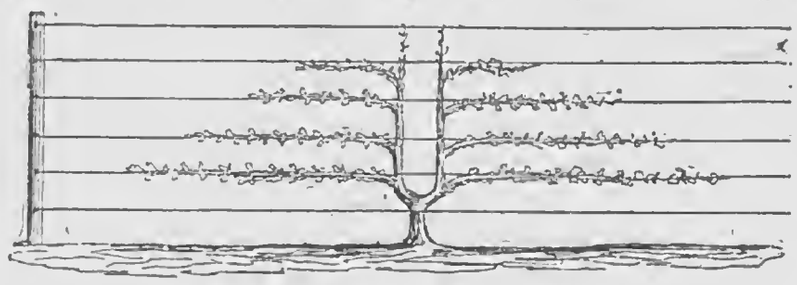
MR. TODD advocates the use of the card or a rubbing pole to destroy the insect, "*whether it is in the larval, chrysalid or fly transformation,*" as soon as it begins to emerge from the back of the animal. Here it seems the insect may emerge at any state; but how can a chrysalid which is dormant and helpless gnaw itself out? And how can the carder be on the watch to catch the creature when it puts out its head, and card its head off? And, lastly, how would these remedies answer in the large droves on the plains where the most of the mischief is done? A person who deals with "scientific facts which cannot be controverted," should at least give reasonable and practical remedies. I think there are at least 10,000 readers of the RURAL who know that at least some of Mr. Todd's statements are wrong and I leave them to judge.

The death of Jersey Belle of Scituate is a loss to mourn over. She was undoubtedly a phenomenal cow and has met the fate common to such large producers. Milk fever is the bane of heavy milkers and it seems, whether they are naturally prolific or are made so by undue forcing the danger is equally to be feared. The unnatural excitement of the organs is more than a cow can survive for a full term of life.

There was once a man—either real or imaginary, it serves the same purpose—who wanted to carry on wars by contract. His method was as follows: "I will take a thousand men and challenge a thousand of the enemy. Kill them. Challenge a thousand more. Kill them. In a hundred days a hundred thousand men are disposed of. Let them bring on a hundred thousand more; I will kill them all off by computation." This seems very absurd, but things equally absurd are said and proposed every day. Here is an instance. A person tells us in an agricultural paper how to get cheap butter. He feeds 32 quarts of meal daily to eight cows and gets 26 pounds of butter in a week. He feeds the same quantity of meal to six cows and expects to get 35 pounds a week; then he feeds the meal to four cows and gets 40 pounds a week. Alas! why did he stop? Had he given the meal to two cows he might have, at the same rate of computation 120 pounds of butter and with one cow about 240 pounds. And all by computation. Such foolishness as this does much harm by weakening the confidence of the persons who read it.

HARVEST time is a weariness for the housewife who is put to her wits' ends to provide food for the help. The farmer who has a small flock of sheep is saved all bother of this kind. A carcass of mutton is a very acceptable provision for a lot of hungry men and there is no danger of the meat spoiling before it is all consumed. Domestic consumption is the first thing for a farmer to consider and for this purpose a few sheep might be usefully kept on every farm, just as a moderate flock of poultry is kept for eggs and meat for the household. If this were done the dog nuisance would be got rid of; for farmers would then get along without dogs of their own, and stray ones would be cursorily dealt with.

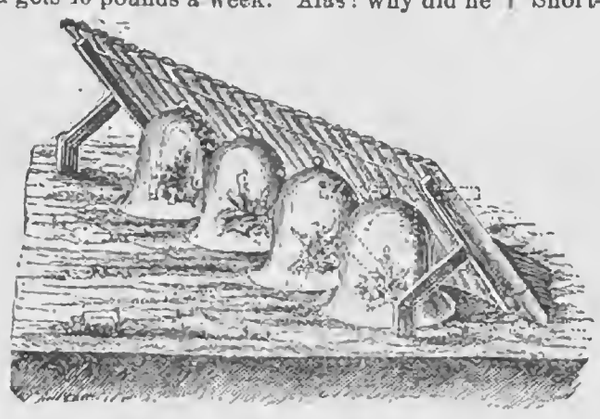
WE do not sufficiently estimate the value of the modern improvements in our methods of watered regularly. On the old system o carrying stock the loss of weight caused by the suffering of the cattle was 10 per cent.; in the new cars the loss is found to be only three per cent. The value of the quantity of humanity involved can be computed to a dollar, being seven per cent. on the gross value of the live stock carried. Humanity costs money, but it is money well spent always.



ESPALIER PEAR TREE—HORIZONTAL TRAINING.—FIG 380.

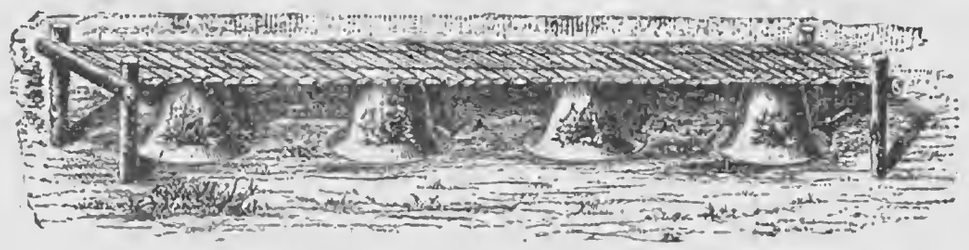
Hereford Cattle.

In his article on Hereford Cattle in the RURAL of July 23, Mr. Miller asserts that they have the advantage of 25 per cent. in the grazing and feeding qualities. This is very *easily said*, but it remains to *be proved*. Some of the choicest Herefords imported by Mr. Corning, of Albany, New York, in 1840, and subsequently, were taken into Erie and Genesee Counties, kept for several years alongside of Short-horns, and did no better, if even so well. At any rate, they soon ran out there, and scarcely one can now be found in that whole region; while Short-horns have multiplied rapidly, and the full-breds, and their grades are at present a majority of the cattle in these and some adjoining counties. It has been proved over and over again, for the past 50 years in America, that Short-horns are as hardy as any other cattle in existence. If some bulls turned out on to the ranches of the great Western plains have not proved so hardy, it is simply because they were *too* high-fed, pampered and forced from birth till taken there; and consequently when let loose to shift for themselves, and deprived of their accustomed meal or grain ration, and above all allowed to serve numerous cows without restraint, they very naturally lost in condition. Herefords, or any other breed of cattle would have suffered in the same manner, reared and then used like the Short-horns above.



ADJUSTABLE PROTECTION OF STRAW-MATTING. FIG. 381.

NOZZLE OF FRENCH WATERING CAN WITH COPPER LIP.—FIG 382.



CLOCHES PROTECTED BY STRAW-MATTING.—FIG 383.

Jersey Working Oxen.

What is said of Guernseys on p. 485, is excellent and no one values them more highly than I do. In speaking of the bullocks, it is said they make strong and excellent draft animals, and work of the admirable Connecticut working oxen. They are also very hardy, and do not mind the hot sun at all. Considering the small cost of their harness—a simple yoke and a pair of bows—and the quickness and ease with which they can be attached to and detached from the cart, plow or harrow, these cattle are more economical than either of the three pairs of work horses which are kept on the same farm with them.

Jersey bulls are not very salable as a general thing, and hundreds of the calves now annually go to the butcher for veal. As there is no doubt if made steers that they will make first-rate, smart working oxen, it is to be hoped now they may be more often saved and reared for this purpose. The doing of this will prove quite an advantage to the country, and render the Jersey cow more popular than ever among us. A CATTLE BREEDER.

Pure-Bred Holstein Cattle.

ON the 28th ult. there arrived in this city, by the "Red Cross Line" from Holland, 127 head of pure-bred Holstein cattle, imported by Messrs. Smiths & Powell, of Syracuse, N. Y. The herd consisted of 101 heifers, 19 heifer calves, three bull calves, one cow, three bulls, aged three, two and one years respectively. It has not been our good fortune to see all of the importations of cattle that have arrived in this port, but of all that we have seen this was certainly the finest lot that we have ever examined. The animals were selected from the representative herds of North Holland by one of the above firm, who are dealing largely in this breed. They were looking unusually well after their eight days' voyage, and were immediately transferred to Lakeside Stock Farm at Syracuse. This breed of cattle is fast becoming popular in this country and as milkers they have already taken a front rank, for the record of some of the Holsteins has not as yet been excelled. Speaking of the record of some of these cows, we are reminded of a recent inquiry from one of our subscribers, who was anxious to know if *we, personally*, believed that the record of the Holsteins, as published in our special "Cattle Number," was a true and correct one. The RURAL has certainly nothing to gain and much to lose by stating things in its columns that are not strictly true. We answered our inquirer that we certainly did believe it true, otherwise we should not have inserted it, and we are informed that the parties are ready to make affidavit to the correctness of the record as printed in that number.

The Apiarian.

COMB FOUNDATION.

How Constructed.

THE process of making comb foundation is not an intricate one. In a deep boiler wax is melted, and in this a thin piece of board or metal plate of the desired width is dipped and to this the melted wax adheres. After the requisite thickness is obtained the sheets are left to cool and will then cleave readily from the molds. Sometimes cylinders are revolved in the melted wax, so constructed as to be raised or lowered at will and on these the sheet is formed. When the sheet is thus prepared it is ready for the foundation machine which gives it the honey-cell impression.

There are before me four specimens of comb foundation recently received from J. Van Deusen & Sons, Sprout Brook, N. Y., varying in measure from four to fourteen square feet to the pound. One specimen for brood frames illustrates the use of wire in comb foundation, which prevents the sagging or breaking down of the comb when weighted with honey. In extremely warm weather there is a liability for the wax to melt and the cells to become somewhat distorted. This distortion the wire is said to preclude. Our best apiarists prefer foundation measuring about five square feet to the pound, and not less than four inches in width.

Reasons for its Use.

It economizes time for the workers. Bees busily engaged in making foundation cannot do this and work in the fields also, and in honey-harvest time it is essential that every worker be at its post. Wax is a secretion formed underneath the abdomen in little pellets, and there may be as many as eight of these at a time. The time consumed in removing, molding and working these wax pellets into comb foundation is considerable, and the rapid secretion of wax requires large consumption of food. The amount of honey required to secrete a pound of wax is said to be not less than 15 pounds. Again, comb foundation insures worker comb. Anything that shall aid directly or indirectly in the rearing of the brood, should be sought for, and in no way can worker-comb be more economically produced than by this artificial means.

Aid the Bees

In the time of comb-making by placing cappings of new combs in feeders near the hive, and they will quickly appropriate it to their

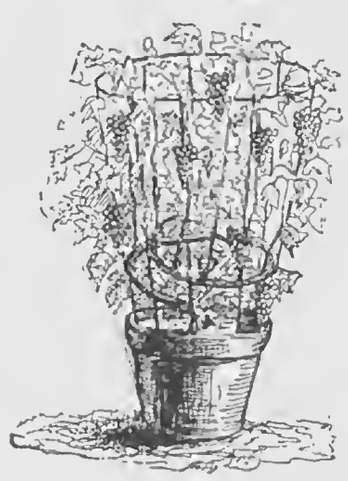


FIG. 384.

GRAPES IN POTS.

life. Ease and comfort prevent physical waste and tend to lengthen life. What is good for man is good for his beast. When men traveled much on horseback it was customary for the horseman to see his horse fed and watered and rubbed down and made comfortable before he fed and rested himself. We ought not to ignore this principle now. It pays. There are now parlor and eating cars for cattle in which the beeves travel in comfort and are fed and a purpose for which their most delicate rivals (meaning the Jerseys), are *entirely unsuitable*. The Italics are mine. In reference to them I wish to add there are exceptions to this. A neighbor of mine has a pair of four-year-old full-bred Jersey steers at work now on his farm, which are as strong and useful as a pair of good 15 hand horses. Their natural walk is at least four miles per hour, and they are fair brothers, reminding me in all their movements

use. Aid them, also, indirectly by saving the old comb, fragments of wax, cappings, etc., and melting them together to be manufactured into comb-foundation by a process of art. More than is thought will be gained by taking care to collect and melt these "scraps" during the busy season, and all will cost but a little labor. J. W. D.

Miscellaneous.

THE RURAL'S liberal offer of premiums for fine heads of wheat has interested me considerably, for Western Washington is a good place to raise them, but I notice that the awards are to be made in the Wheat Special to be issued in August, I believe. This would leave us out, for we raise mostly Spring wheat which does not ripen till near the last of August, and it would take at least 15 days to send it to you, so that we would need till September 20 to do our best. Of course, it would not be fair to suggest a delay for the few that would be likely to compete from here, but I notice in the RURAL that the farmers of Wisconsin, Minnesota and Michigan sowed their wheat as late as, or later than, we did. Perhaps their warmer Summers ripen wheat much sooner, and, all things considered, you may not be able to give more time. So I will do my best with Fall wheat, a rather small chance, however, as it ripens hardly soon enough—from July 25th to August 10th. D. N.

[The RURAL should consider the above. It may be suggested that those who are unable to send in their wheat heads as announced, may send them in later, and should they prove better than those previously sent, some additional premium or recognition may be provided. We see no other way. All should have a fair, equal chance.—EDS.]

What Others Say.

MR. GEO. W. CAMPBELL, the Commissioner of Horticulture to the Paris Universal Exposition of 1878, sends us his interesting report. We can do no better for our readers than to copy the following portions, accompanied by Mr. Campbell's illustrations, which we have had re-engraved.

Speaking of artificial flower-beds, in regular geometric figures cut out of the grass, as shown by Fig. 379. 1st was an outside row of echeverias, carried around the whole circumference of the bed. 2d. Pyrethrum Prince's Feather, yellow, feathery foliage. 3d. Alternanthera, variegated foliage, red, purple, orange, and green. 4th. Another row of Pyrethrum Prince's Feather. 5th. Filling up to center circle, Blue-flowering Lobelia. 6th. Center of small circles, an agave, bedded in green moss. The other plants carried around the whole figure in circular lines and in regular order. The center massed with closely-planted variegated petunias.

Several interesting collections of fruit trees trained in some of the fanciful shapes for which the French gardeners have long been celebrated, attracted much attention. Several of the most characteristic forms are shown in the succeeding figures, which will give a more intelligent idea of this kind of work than an elaborate written description.

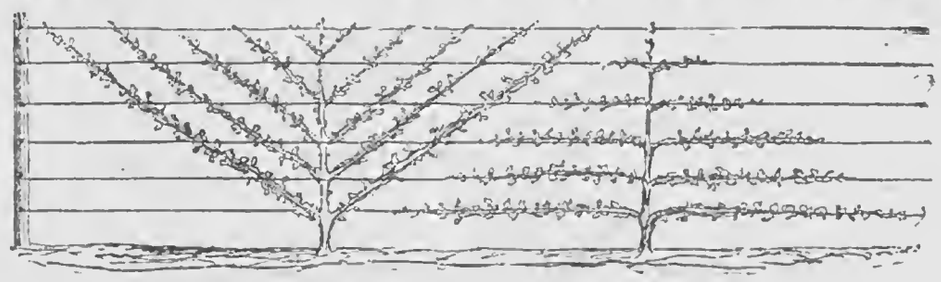
These trees had been trained to their peculiar shapes in the nurseries, and were transplanted to the Exposition grounds in March and April. As represented in the drawings, they were mostly supported by light wire trellis, upon which the limbs were spread flat or fan-shaped, and in some cases additional supports of light wooden lath were tied with willow twigs both to the limbs and the wires, holding them in position.

Fig 377 represents the most elaborate work of this kind in the Exposition. At each end an apple tree, with the lower limbs trimmed in "cordon" in front; two other apple trees, trained in double "cordon" for a low line in front of the wall upon which the principal training was done, with five peach trees, which were made to form the figures as represented, and which figures were first sketched upon the wall behind.

Fig. 388 represents a pear tree trained flat on the trellis, an apple tree trained in the same way, and a pear tree in spiral form, not on trellis. This spiral form is thought to increase productiveness, and is given by training to an iron rod of the desired shape, which is planted in the ground near the stem of a young tree, which is kept tied to the rod as its growth proceeds.

Fig. 389 shows one of the more elaborate styles of training pear trees. This kind of work involves much care, combined with both taste and skill, and can only be profitable where labor is cheap and space is limited and valuable; but there are many places in gardens and yards in towns and cities where unsightly walls, fences, and out-buildings might be utilized by some of these methods or modifications of them, and covered by grape-vines, peaches, pears, apples or other fruits, and thus be rendered not only pleasant to the eye, but sources of pleasure and health to their owners and their families.

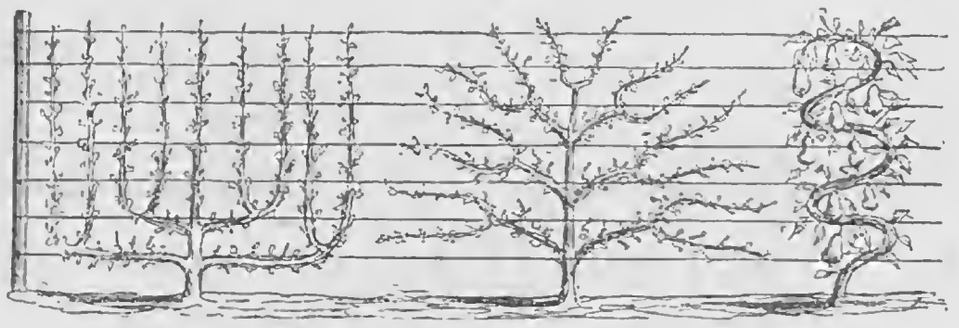
THE grape-vines in pots, a fine illustration of which appeared in these columns, Sept. 20, '79,



ESPALIER PEACH AND APPLE TREES.—FIG. 387.

were trained mostly in spiral forms and seemed very productive and well ripened. Figs. 384, 385 and 386 show some of the most frequent styles of growing and training in pots.

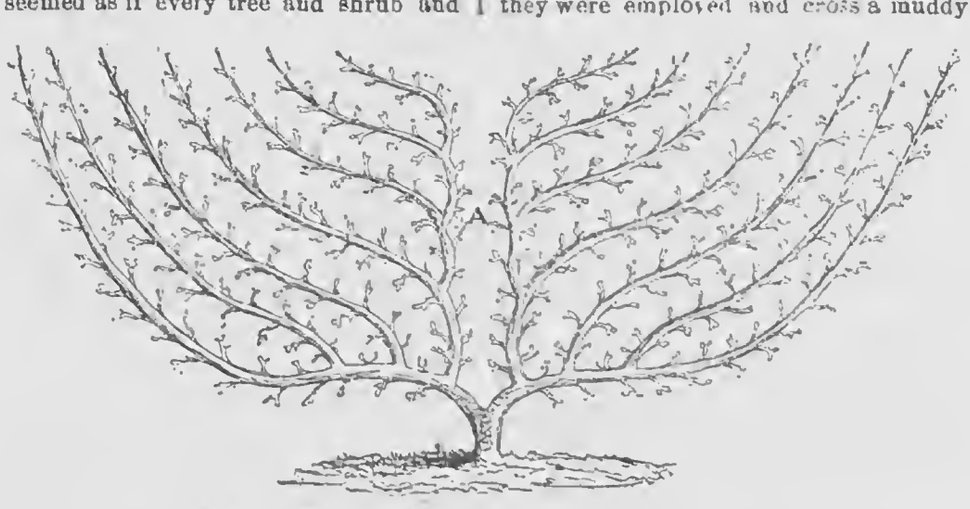
ASPARAGUS.—The growth and culture of asparagus Mr. Campbell says is regarded by the French people as among the most important of their horticultural industries, and during the early part of the season no vegetable is more abundant in their markets, green-grocers' shops, or in the carts of vegetable venders upon the streets. It is not less remarkable for extraordinary size and quality than for quantity. Specimen stalks were brought into the Exposition, perfectly blanched, nine inches to ten inches long and six inches in circumference. This, of course, was exceptionally large, but there were plenty of bunches in the markets the stalks of which would average one inch in diameter or three inches in circumference. They claim to have two or three distinct varieties, among which the Early Argenteuil and the Late Argenteuil are considered the best for general use. Large portions of ground are given up to the asparagus beds in the neighborhood of Paris and Fontainebleau. It



CANDELABRUM, FAN AND SPIRAL TRAINING.—FIG. 388.

is also grown as a supplementary crop between the rows of vines in vineyards. For Winter use it is forced in hot-beds or in glass structures heated with hot-water pipes. In open air culture, the roots are planted in trenches about nine inches below the surface; these trenches are filled with manure and rich fine earth, in successive years, as the roots and plants increase in size and strength, and when the beds are fully established the crowns of the plants are eight or nine inches below the surface of the ground. The asparagus is always cut six or eight inches under ground, and when the tips are about one inch above the surface, and the more perfectly the stalks are blanched the more highly it is esteemed. Small and green asparagus is regarded as very inferior and only sells at a low price, and is used principally in soups. Something may be due to improved varieties, but the principal reason for the extraordinary size and excellence of the French asparagus will be found in skillful culture, giving the plants plenty of room, and an annual dressing of rich compost.

THE prominent and distinguishing features in French horticulture seemed to be almost infinite painstaking and special care; and it really seemed as if every tree and shrub and



PEAR TREE TRAINED IN PALM SHAPE.—FIG. 389.

plant in and about the city of Paris and in the Exposition grounds had some one whose duty it was to look after and care for its special wants and requirements. All were so nicely kept that a faded flower or decayed leaf was rarely seen. Even in the grounds appropriated to the animal shows, one of the first things was the formation of a green lawn, in which were large oval beds made gay and attractive with brilliant flowering plants; and around the inclosure, and the exhibitors' tents, sheds and buildings were large plantations of ornamental plants and shrubbery.

MARKET GARDENS.—The market gardens about Paris are also remarkable for careful culture and wonderful productiveness. They are generally small, containing from one to three or four acres, and nearly all those near the city are surrounded by high stone walls, upon which are closely trained pears, peaches and grapes. Numerous hot-bed frames, sometimes heated by hot-water pipes, and great numbers of *cloches* or large bell-glasses, are found in all these gardens for growing and protecting early vegetables and plants, and are in constant use from October to May. The sashes for many of the frames are of light cast-iron, with handles at the ends, making them very convenient and durable. The bell-glasses are very large, 16 to 18 inches in diameter. The market gardeners about Paris, in addition to the high cost of manure and other fertilizers, are obliged to pay a rent of $100 to $125 per acre per annum. But they cultivate every inch of the ground and often have two or three crops on the same area, which are taken off in succession. They manure highly, plant closely, cultivate perfectly, water abundantly and keep the ground constantly occupied both Winter and Summer. Mr. Campbell was told they managed to take as many as eight successive crops in a season, with various kinds of salads, radishes, potatoes, cauliflowers, cabbages, &c.

Figs. 382 and 390, represent a very ingenious and useful implement, having important advantages over perforated sprinklers. By changing the shape of the lip or having tips of different sizes and increasing or diminishing the aperture, these water-cans may be adapted to all kinds of work in sprinkling for the garden or greenhouse. The work is done more rapidly, and the stream of water is spread into a wide thin sheet, falling in fine spray and always uniform, and never clogging by slight impurities in the water, as with the perforated sprinklers. It is the invention of M. Raveneau, of Paris, and is largely used by the gardeners of Paris and vicinity.

DOMESTIC AND IMPORTED WINE.—Our old friend, the Germantown Telegraph, says that as a rule our domestic wines are much purer than the imported, and a far greater degree of cleanliness is observed in their manufacture. A gentleman of Philadelphia, who was in the wine-producing districts of France some time ago, and saw the process of making clarets, says that the juice is still expressed by tramping with the naked feet, and that he saw some of these "trampers" leave the vats in which they were employed and cross a muddy road to get their dinner, without covering their feet and on their return jumped into the vats again with the mud still clinging to them!

SPEAKING of the water-cress, the editor remarks that all that anyone who has a spring upon his premises has to do is to introduce the plants along the edges and wherever there is a low place into which the water from the spring can spread, and he will raise watercress according to the extent of the arrangements which nature provided. It is very appetizing for breakfast or tea, eaten with a little salt only; and we are very sure that if it is once introduced it will never be abandoned, either for private consumption or for marketing.

LEARNING A TRADE.—"I say, then, lads of sixteen, if you would lay a foundation for a sure prosperity, begin by learning a trade." So says James Parton. "If you would escape the perdition of being a fool, learn a trade. If you would do a man's part for your country, begin the work of preparation by learning a trade." Our friend, Dr. Hoskins, commenting editorially upon the above, says: "We glory in Mr. Parton's 'spunk,' in saying what his experience in life leads him to think in regard to this matter, and would only add that one of the very best trades for a young man to learn is that of a farmer. We shall never have many good farmers until farming is regularly learned as a trade at an agricultural school

WATERING CAN OF M. RAVENEAU.—FIG. 390.

with a first-class farm, or upon the farm of an educated and first-class practical farmer. Preferably we should say, take both courses."

A NEW WAY OF PRESERVING FRUIT is described by the Republican, of Sisson, California. Among the fruit lately shipped East from that place was a car-load of assorted fruit put up according to the Dietz packing, a recently patented process. The preservative agent is carbonized wheat bran, and by it fresh fruit is preserved from decay so that it can be shipped East as slow freight and sold off as the demand is made for it, without being compelled to sacrifice it for fear of loss. The car-load shipped goes to Philadelphia. It contains grapes, plums, peaches, apricots, etc., and goes as fast freight, though hereafter it is the plan to ship by slow freight, as it will reduce the charges over one-half, or from $1,100 to $600 a car-load to New York. If fruit can be packed in this inexpensive manner, and preserved indefinitely and shipped anywhere, the business will develop. "Fresh peaches at Christmas and grapes in mid-Winter" are very alluring, and Mr. Dietz says they may be had by simply packing them in wheat bran reduced to charcoal.

CONUNDRUMS ASKED AND ANSWERED.—At one of the meetings of the Michigan Pomological Society, the following questions were asked and answered:

1. Which is the best of the new colored grapes?

Several gentlemen of experience named the Brighton?

2. Which is the most promising of the new white grapes?

Mr. Woodward was asked to give his preference outside of the Niagara (which was known to be his own grape), and he replied "unquestionably the Prentiss." Quite a discussion upon this topic brought out the champions for several of the later white varieties, including the Lady.

3. What is the best evergreen for ornamental hedges, and how expensive is it by the hundred?

The hemlock. Good hedge plants can be purchased for $13 00 per hundred, and of small size for a good deal less.

FROM Puck:—"The weight of a bale of hay is governed entirely by the capacity of the team following the wagon."

MATRIMONY, says a quaint writer, is a flourishing tree, and cradles are the fruit baskets. . . . . It was a little hard to say of a doctor who was taking a stroll in a churchyard that he had gone to see some of his old patients. . . . . Said Lady Montague: "It goes far to reconcile me to being a woman, when I reflect that I am thus in no danger of ever marrying one." . . . . . Said Jane Porter: "He that easily believes rumors, has the principle within him to augment rumors. It is strange to see the ravenous appetite with which some devourers of character and happiness, fix upon the sides of the innocent

and unfortunate."—Detroit Free Press. . . . . According to a truthful India newspaper, a hungry lion invaded a young ladies' seminary on commencement day, and, bouncing in among them, carried off the prettiest and plumpest, with her composition in her pocket—a school-girl essay on kindness to animals.—Detroit Free Press.

RURAL BRIEFLETS.

SPITE of all the little difficulties and vexations connected with our Seed and Plant Distributions, the many pleasant letters we receive regarding them give us much pleasure in many ways. Here is one which differs from all others:

DEAR RURAL, Just a line to let you know
The seeds you kindly sent some months ago
Were planted acording to direction,
And are now worthy of inspection.
Nearly all have well repaid my labors,
And quite roused the wonder of my neighbors.
The Branching Sorghum measures six feet high,
And still the plants are rising toward the sky.
Washington Oats have grown to such a size
I fondly hope to carry off the prize
At the Hudson Fair, unless the wind plays tricks,
As it already has with wires and sticks.
The Elephant "tater claims attention,
And therefore here I briefly mention,
From the tuber I cut nine fleshy eyes,
And *one* has grown to such a monstrous size,
I've had to pull up plants to give it air,
And it takes up now fully one yard square;
The rest are smaller but still quite healthy,
In spite of the bugs which crawl so stealthy.
As for the Picotees and Pinks,
A failure here is sure, methinks;
However, they were planted rather late,
So I shall try to "labor and to wait."
I'll give them water, light, heat, shade and air,
And hope they'll by-and by repay my care.
I really could not find a place to spare
In which to sow asparagus—so, there!
I'll keep the seeds another year or so,
And hope that won't injure them when they grow.
I'll send further letters if you ask it,
If not, just pitch this in your waste basket.

P.S.—
Yesterday I cut one big sorghum plant,
And left it from the ground but one foot scant;
'T was almost worth your while a mile to walk,
To see the cows snap up both leaves and stalk.

Hudson, N. Y., July 20, 1881. TOM.

WE are sad to learn that our correspondent, Henry Smith of Henderson, N. C. fell from a scaffolding on which he was at work and dislocated his neck. He was a prominent man among the fruit culturists of that section, being largely interested in the cultivation of all kinds of fruit.....

EVEN though the Henrietta (Belle de Fontenay) is killed back every year, it is still a good raspberry for the amateur, as it bears a fair crop on the young canes and the berries are large and of fine quality. Our Caroline Raspberry is still (July 21) bearing fruit.....

HERE is one of those positive and often erroneous notes which appear from time to time in the Ag. columns of the N. Y. Sun:

PERENNIAL CLOVERS.—"The agricultural editor of the Weekly Times informs a correspondent 'that there is no perennial clover except the white. The common red is a biennial plant, flowering and seeding the second year, when the roots dies.' All this will be news to many farmers, and to every botanist in the world. It is certainly true that both red and white clover do burn up and die out very quickly on some light, poor soils, but they are, nevertheless, perennial plants, and in good soils live for many years."

There are several statements in the above note that should not go uncontradicted. It is news "to every botanist in the world" that the Common Red Clover is a biennial—is it? The editor of the agricultural columns of the Sun will probably concede that Dr. George Thurber is a botanist and one of our first authorities on grasses, among which Red Clover may be reckoned since practically it is a grass, though botanically a pulse. He says that "the plant is generally considered to be a biennial." Dr. Darlington says: "Root biennial, or perennial?" Dr. Gray calls it a short-lived "perennial," hence, according to him, our first botanical authority, it does *not* "live for many years." We do not say that Red Clover is a biennial, strictly speaking—agreeing with Dr. Gray that it is a short-lived perennial. In congenial, rich soil, no doubt this clover will reseed itself from year to year and thus preserve the field in clover "for many years." But there is no evidence that this may be said of the individual plant.....

SEVERAL years ago this same Ag. Ed. took the RURAL to task for stating that the Japan Persimmon was tender in the climate of New York. He has since admitted that it is tender, himself, though without allusion to his previous blundering assault. Those who in their arrogance are ever on the look-out to pick musses with others, should at least be manly enough to confess their ignorance when it has been plainly pointed out.....

"I SEND you to-day (July 18)" says Mr. P. R. G. A. of Connecticut, "a branch of the Naomi Raspberry, by many said to be identical with Franconia. It is from six-year-old bushes. I have just picked from a quarter of an acre 70 quarts, of which those I send are fair samples. The Naomi has never been winter-killed with me."

It has been at the Rural Grounds. The fact is that in this climate and south most foreign kinds of raspberries lose their leaves in late Summer and do not in consequence fully ripen their canes. "Hardy" and "tender" as applied to many plants, but to raspberries especially, have little to do with cold. Those which are generally injured by the Winters in this latitude may prove quite hardy further north—even in Canada. Heat and drought are often more trying to raspberries than severe cold.....

CONSIDERABLE has been said of late about the Manchester Strawberry which originated on the grounds of Mr. Jesse Battey of Manchester, New Jersey. Plants were first sent to us by the Messrs. Hales of Glastonbury, Conn. to be tested at the Rural Grounds. There they behaved splendidly, no other of many varieties set out at the same time having borne more fruit, which was firm and of a good quality. From favorable reports which came to us from a number of leading small-fruit growers who had visited Mr. Battey and seen this strawberry growing upon his sandy soil, we were disposed to place it in our Distribution of 1881-2. Later, however it appeared that the Manchester was not controlled by Mr. Battey as he had sent plants to several growers who, believing it to be of considerable promise, had propagated it as fast as possible. The RURAL NEW-YORKER concludes therefore that the Manchester needs no assistance and that it is better to leave it in the hands of those who have it for sale.

Our opinion of this strawberry is that it is larger and more prolific than the Wilson; of a brighter color; fully as firm and of a better quality. On the other hand, there is this to be said against it, viz,, that the flowers are *pistillate* and consequently to prove productive need other plants bearing *perfect* flowers close at hand.....

IN an able dissertation on the Influence of Agriculture upon Character published in the Massachusetts Ploughman, the author, G. H. F., of Maldew, after showing how uniformly nations of all times and continents have prospered in proportion to their culture of the "joyous cornfields," laments the increasing tendency to forsake the rural comfort and respectability of our fathers, for the excitement and strifes of the city; an insatiable desire for wealth taking the place of the 'earth-hunger,' as Emerson terms it, of our forefathers. Tacitus said of the early Anglo-Saxons that they shunned the city and sought their abodes in green glades by the sparkling springs. The article concludes with the following poetic paraphrase by Whittier of the idea expressed by the words "growing two blades of grass where but one had grown before."

Give fools their gold, and knaves their power,
Let fortune's bubbles rise and fall;
Who sows a field; or trains a flower,
Or plants a tree is more than all.

For he who blesses, most is blest;
And God and man shall own his work,
Who toils to leave, as his bequest,
An added beauty to the earth.

WE are receiving thus soon quite a number of reports as to the Rural Branching Sorghum. Most of them, we are very glad to see, are favorable. Here is one from Mr. Mark W. Johnson, of Atlanta, Ga.

"About half a dozen seeds of your R. B. Sorghum germinated, and so far the plants are growing and branching finely nothwithstanding severe drought and great heat.....

HERE is another from Mr. H. H. Clark of Illinois: "I see in the last RURAL that the seed of the Rural Branching Sorghum you sent out has not germinated well. The package sent to me has done extra well—nearly every seed grew, making from 10 to 25 stalks per seed."

He also adds: "I cut the Washington Oats to-day (July 14.) They stood four and a-half feet high; heads 10 to 16 inches long; grain plump and heavy. They rusted a little."....

DR. HEXAMER, after a visit to Mr. Battey of Manchester, New Jersey, called at the RURAL office and was requested to give his estimate of Mr. Battey's "Manchester" Strawberry. He replied as follows: "It bears the most uniformly large berries of any kind I am acquainted with. They are of regular shape, of good quality and sufficiently firm for market. The plant is entirely hardy; stands the heat and drought well. It is of a more desirable color than the Wilson."

It now remains to be seen how the Manchester will act in other soils and climates. But the presumption is that as it thrives in the sandy, poor soil of Mr. Battey's farm, it will thrive almost anywhere.....

BOOKS, CATALOGUES, ETC.

TENTH ANNUAL REPORT of the Secretary of the State Horticultural Society of Michigan—616 pages. We are always glad to receive this volume which this year, from the cursory glance thus far given, seems more interesting than usual. Michigan is blessed with many wide-awake, enthusiastic horticulturists who are doing fine service to the State. Chas. W. Garfield, of Grand Rapids, is the efficient Secretary. His Portfolio comprises 100 pages of matter selected with good judgment and evident care from the current horticultural literature of the country. We shall refer to this book on future occasions.

MEMORANDA OF THE ORIGIN, PLAN, and Results of the Field and other Experiments conducted on the Farm and in the Laboratory of John Bennet Lawes, LL D., F. R. S., at Rothamsted, Herts; Also a Statement of the Present and Previous Cropping, etc., of the Arable Land not under Experiment. This publication comprises 28 pages 7x13 inches in size. It is to be regretted that a copy of this and all other of Dr. Lawes's publication could not be placed in the hands of every intelligent farmer.

PETER HENDERSON & Co., 35 Cortland St., N. Y., Circular of Pot-grown Strawberries for 1881. Specialty of Durand's new late Strawberry Jersey Queen, the sale of which Mr. Henderson controls. Mr. Henderson also issues two handsome colored plates—one of Jersey Queen, the other of Glossy Cone, Sharpless, Jucunda, Bidwell, Downing, Pres. Lincoln, Gipsy and Monarch of the West.

G. H. & J. H. HALE, Elm Fruit Farm and Nursery, South Gladestonbury, Conn., Circular (sent free to our subscribers) of pot-grown and Layer Strawberry Plants for Summer and Fall. Among the novelties we find the Manchester, the sale of which is for the most part the present season controlled by the above firm and Mr. Lovett.

E. P. ROE, Cornwall-on-Hudson, N. Y. Catalogue of Small Fruits and Grape Vines for the Summer and Fall of 1881. The Bidwell Strawberry a specialty. This catalogue of 25 pages will be sent without charge to those of our subscribers who apply to Mr. Roe by postal or otherwise.

ELLWANGER & BARRY, Mount Hope Nurseries, Rochester, N. Y. Catalogue (No. 3) and Descriptive price list of Strawberries and other small fruits. The lists are divided into American, Foreign and New Varieties. No charge, we believe, is made for this catalogue.

J. T. LOVETT, Little Silver, Monmouth Co., New Jersey. Pamphlet of Pot-grown and Layer Strawberry Plants for the Summer and Autumn of 1881. The Manchester a speciality. Sent free to applicants.

Everywhere.

RURAL SPECIAL REPORTS.

Illinois.

WALNUT, Bureau Co., July 25.—Spring was three weeks late. Winter wheat was nearly all winter-killed, and Spring wheat is poor, being injured by chinch bugs. Corn is late and poor, but growing rapidly now. Rye is good; oats are fair, the grains being plump, but the straw short. Barley is good but colored. Potatoes poor. Very few apples; no cherries; plenty of small fuits. W. C.

Iowa.

CARROLL Co., July 21.—My Washington Oats are, in common with all other oats in this section, badly affected with rust. They are also troubled with a disease which I have not noticed in any other variety—it resembles smut in corn. In 110 heads 25 were ruined by this disease. But as this has been a very trying season I am not surprised. I shall try them again next year. Can you suggest any precautions that may be used against the spreading of the smut in next crop? G. S.

[Only that of steeping the seed, as recommended for wheat, in strong brine or a solution of sulphate of copper—a pound of sulphate to two gallons of water.—EDS.]

Michigan.

BYRON CENTER, Kent Co., July 20.—Wheat in general is a thin stand, but the heads are large and well filled; will yield from seven to eighteen bushels an acre. The Washington Oats I sowed in the last week in April. They made three rows sixty feet long in my garden and to-day they stand four and one-half feet to five feet nine inches high. The panicles are nine to fifteen inches long. I hope to make a good report on the White Elephant Potato this Fall. The pink seeds came up well. Several plants are in bloom and are beautiful. I am more than ever pleased with the RURAL. Although farming on a small scale the information and advice which it gives are just what I need. WM. K. E.

Nebraska.

FULLERTON, July 18.—Crops excellent. Corn simply immense. Fifteen hills of the White Elephant were doing tip-top. The Rural Branching Sorghum is all you recommended it to be. I am suckering a few stalks to make seed if possible. The Washington Oats are about half smut; other oats are not injured at all. The flower seeds did not do well; the soil was too new; those growing are beginning to bloom and are beauties. J. H.

New Jersey.

HAMMONTON, Atlantic Co., July 20.—No grain worth mentioning is raised in this town. Fruits of all kinds are our speciality. A month ago our fruits were running the gauntlet of the rose bug. The blackberry canes had been killed above the snow line, and it looked as though the rose bug meant to finish what was left and it did nearly in some fields, and also destroyed tons of grapes. The pests do not take the apple blossom, as I read in the RURAL, but the apple itself, as the fruit is well formed before they arrive. But in spite of them, the apple crop was never more abundant than now. Pears ditto. Strawberries were a heavy crop; but the price was low. Black and red raspberries are good crops and bring good prices. We have about 600 acres of this crop in bearing this year, probably 100 acres of it being under one-year-old vines. About 200 acres also were set the past Spring. Our shipment of blackberries on Monday July 19, was 1,100 crates—about 1,200 bushels. We began picking on July 8th. With seasonable rains, the picking lasts about four weeks. For pickers we depend mostly on Italians who come down from Philadelphia by the hundred during the berry and cranberry season. As to potato bugs, with Paris-green or London-purple we are masters of the situation, but who, pray tell us, who will give us a successful method of fighting rose bugs! Hand-picking has been tried, but it is too expensive. P. H. B.

TOM'S RIVER, Ocean Co., July 21.—A field of corn, planted very early, was doing very well until it began to ear, about three weeks ago, when it was struck almost all dead by the hot, dry blast which has come on, and it will not yield one-tenth as many ears as if cooler weather, with an occasional shower, had kept on. The cool, wet weather of June gave the stalks such a rapid growth that they immediately wilted when the drought began. The later-planted is doing well and will give an abundance of ears. Last year it was quite dry in May and June, and yet the corn grew finely and by the 15th of July supplied our table bountifully. A neighbor has a considerable field alongside of mine, which was sowed broadcast the last week of May for soiling his Jersey herd of cows. It had a fine growth till the hot weather set in, and this has killed several acres of it on the most sandy part of the soil, making it look almost as bad as if a fire had passed over it. In the yellow, gravelly soils around me the corn keeps on growing nicely and it is suffering very little from the hot drought. A. B. A.

New York.

AVOCA, Steuben Co., July 23.—We are having here one of the best seasons for the growth of agricultural products that we have had for several years—just rain enough to make everything shoot. Wheat is not quite up to an average owing to a dry Fall giving a small stand and to the large amount of snow that in some places "smothered" it, and to the presence of rust in some localities; still, a good fair yield will be secured. Oats are very heavy and lodging badly, which, of course, will interfere with their filling, but to what extent yet remains to be seen. Barley is good and will be more than an average crop; it is raised here to a considerable extent, but is not a specialty. Rye is a fine crop and is being secured in fine order. Hay is heavy—excepting on old meadows—it is selling for $8 for 2,200 pounds, delivered. Considerable wool is grown and sold this year at from 35 to 38 cents. Corn is mostly late and small, but there is a good stand where it has not been badly eaten by worms. Apples are not a large crop this year, owing to the enormous one last year; many apples are falling prematurely, but the prospects are good for enough for home consumption. Dairying is a speciality here, as the many cheese factories and large farm butter dairies scattered over the country will show. The abundant rains give plenty of feed, which is readily converted into these two new necessities of life. Cheese now is worth 10½ cents and butter 20c. Buckwheat is scarcely far enough advanced to report upon, although appearances are favorable. The crops of small fruits are abundant, excepting perhaps cherries. SCRIBE.

CATO, Cayuga Co., July 20.—The Rural Branching Sorghum seed sent me must have been better than the average, for out of 115 hills I have 110 that are three feet high. I planted three kernels to the hill or flat place, using one table-spoonful of phosphate to the hill, and have thinned to one stalk, each of which has from 10 to 15 spears or suckers. The Washington Oats are in drills manured with phosphate, and covering a space of 6x25 feet. They are nearly five feet high with heads one foot long. The White Elephant Potato I cut into 25 pieces with one eye to each piece, and I planted one piece in a hill. I have now 24 hills that are very large, I brushed the dirt from one side of a hill to-day, and saw three large tubers—larger than the one sent me. They have been planted only two months. I am highly pleased with the RURAL and shall preserve a piece of my best land for the next Seed Distribution and get more to subscribe for the paper. [Thanks.—EDS.] J. K. R.

HIGGINSVILLE, Oneida Co., July 23.—I have just measured a few heads of the Washington Oats you sent me last Spring. I found many 14 inches long and one 15 inches. The Branching Sorghum begins to grow. One stalk measured was 22 inches high. I have 24 hills of White Elephant Potatoes, but I do not expect much of a yield on account of the bugs. They injured them badly early in the season. The asparagus is growing finely. It is very dry here at present. Potatoes will be a short crop if we don't have rain soon. Corn is very backward. Oats bid fair for a fine crop. H. E. D.

OAK BURN, Columbia Co., July 21.—My Washington Oats are splendid; the straw is stiff and heavy, stands four feet eight inches in hight, and the panicles are remarkably well filled with grain. They may be identical with the Canada or Barley Oats which were rated at 40 pounds to the bushel. R. M. L.

Ohio.

RICHFIELD CENTER, Lucas Co., July 22.—The Beauty of Hebron Potato you sent me, I think is the best early potato I ever saw. The White Elephant is doing well—many thanks. I think the RURAL is one of the best of papers. O. T.

Pennsylvania.

NEW LEBANON, Mercer Co., July 22.—The weather has been very favorable for harvesting—not very warm and but little rain yet. The wheat harvested has been a pretty fair crop and the hay and oats are as good as, if not better than, last year. Corn seems to be a failure all over, a great many having had to replant on account of the wire-worm. Many have sown their corn-fields to buckwheat. If there is not more rain than we have been having, the potato crop will be small tubers and few in the hill. Apples are plentiful this year again. The strawberry and raspberry crops were good, selling from 8@10c. per quart. Butter 14c. per pound; eggs, 12½c. per dozen; potatoes 75c. per bushel. J. E. C.

Vermont.

TROY, Orleans Co., July 23.—The past two weeks have been cold and wet so that hay will not be an average crop, though it will be a fair one. Corn is small and the frost in June ruined so much of it that the crop will be small, as a good deal was plowed up and the ground sown with barley which will be a larger yield than we have ever had here. Wheat does not look as well as it did at this time last year, but the acreage under it is larger. On the whole, I think the outlook for farmers in Northern Vermont is fair. I see reports of thunder, hail and wind storms doing great destruction to crops, buildings, stock and human lives out West, whereas Vermont has suffered little from these agencies, and I, for one, don't want to "go West." D. A. B.

Washington Territory.

OAKVILLE, Chehalis Co., July 16.—The RURAL seeds came all right about June 20. I was well pleased. The pinks came up very well, and the potato sets are coming up already. It was rather late for oats, so I left them for next year. We had a mild Winter and an early Spring. Rainy weather in April hindered sowing somewhat and some grain is rather late, but the season is favorable and grain looks well. Hay will be a little lighter crop than usual as the cool weather and showers seem not so good for grass as for grain. Wheat is our main dependence; it is worth 70@80c. at the mills 22 miles distant. Sheep are very profitable to those who have prairie land. Wool is 23@27c. Cattle and hogs pay well this year. At the mouth of the river and around Gray's Harbor cattle raising and dairying are the chief industries. Haying will commence as soon as it clears up again. D. N.

YAKIMA CITY, Yakima Co., July 12.—The amount of land under cultivation in this county is very small; it has been used almost entirely for grazing purposes and the only farming to any amount is across the Columbia River in Walla Walla County. W. D. I.

The Querist.

ANSWERS TO CORRESPONDENTS.

Caponizing Roosters.

H. O. G. R., Liberty, Va., asks how to caponize young roosters.

ANS.—The best birds for capons are the large breeds, Asiatics or Dorkings. They should be two to three months old; old birds seldom survive caponizing. Before the operation they should be deprived of food for from twenty-four to forty-eight hours, so as not to have their bowels distended. There are instruments made for the operation, which can be purchased in most cities. Capons should be kept till the age of 15 to 18 months, which will bring them to full size, which should be double the size they would have attained had they not been caponized. The bird to be operated on, must be fastened down on his side to a board or bench through an augur hole; the wings should be drawn together over his back and well secured; the legs drawn backward, the upper one drawn out furthest and secured. The feathers must be plucked from the right, or upper side, near the hip joint, on a line with and between the joint of the shoulder. The space uncovered should be about one and a-half inch in diameter on an ordinary-sized bird. Draw the skin of the part backward so that when the operation is finished the skin slides back to its natural position and covers the wound in the flesh, and does *not*, when neatly done, require sewing. Make an incision with a fine, sharp penknife (or proper instrument is best), between the last rib and hip, commencing about an inch from the back-bone; extend it obliquely downward, from an inch to an inch and a half, just cutting deep enough to separate the flesh; take great care not to wound the intestines. The wound must be kept open with an instrument with a spring, called a retractor, or with something answering the same purpose, stretching it wide enough to afford room for the work. Then, carefully cut the membrane covering the intestines which if not sufficiently drawn up, may be pushed towards the breast-bone lightly by a spoon-shaped instrument, or the handle of a teaspoon. The organs to be removed are readily recognized—a small reddish-yellow cylinder attached to the spine on each side, covered with a fine membrane or skin which must first be removed with forceps and a fine hook to draw it away. With the left hand introduce the bowl of a spoon (an instrument is made for the purpose) under the lower or left testicle, which is generally a little nearer to the rump than the right one. Then take the instrument called a cannula, which is a hollow tube with a horse hair passed through it forming at the end a loop which can be tightened by pulling on the two ends of the hair at the other end of the tube. Pass this loop around the testicle with the help of something to place it in position (the cannula has a hook for this purpose) so as to bring the loop to act upon the parts which connect the organ to the back. Then by drawing the ends of the hair loop back-ward and forward, and at the same time pushing the lower end of the tube or cannula towards the rump of the fowl, the cord or fastening of the organ is severed. A similar process is then to be repeated with the uppermost or right testicle, after which any remains of the organs together with the blood around the wound or at the bottom must be removed with the spoon. The reason for operating on the left or lower organ first is to prevent the blood from covering the lower one if left last. When the operation is performed, which if skillfully done occupies but a few minutes, the retractor is taken out, the skin drawn over the wound, which if it was drawn on one side before cutting (as mentioned above), will connect at a place not exactly opposite the wound in the flesh, thereby covering the flesh wound. If skillfully done it requires no sewing. The old French system was to operate on each side of the fowl, but the system here described is considered an improvement on the antiquated Gallic method. The necessary tools can be had of H. H. Stoddart, Hartford, Conn.

"Listing."

W. H. W., Beaver Crossing, Neb., asks for a description of "listing"—the new method of tending corn described in a late "Everywhere" report from Kansas.

ANSWER BY PROF. E. M. SHELTON, OF THE KANSAS AG. COL.

The method of corn culture known as "listing" consists primarily and simply in striking furrows wherever the rows of corn are to be, and in these furrows planting the seed. The work is done by a "listing plow," which is simply a plow having a double mold-board, which throws the earth equally to the right and left. This plan is used without other preparatory tillage. The "lister" is worked by three horses, and, as will be seen, after the field is finished its surface is made up of a succession of ridges and furrows, but presenting an exposure of fresh earth in all its parts. In the furrows made by the "lister" the corn is drilled by any one of the numerous corn drills, which put in the seed at intervals of eight to sixteen inches. In some cases the lister is provided with a drill attachment, which drills in the corn as fast as the furrow is opened. The advantages of this method of corn culture, so far as labor is concerned, will be appreciated when it is remembered that a man and team will thus put in eight to ten acres of corn per day. After the corn is planted the harrow is kept at work over the field until the corn is eight to ten inches high, when the cultivator finishes the work. The harrow acts very efficiently upon the ridges between the rows of corn, leveling the ground and working the fine earth about the corn. Upon loamy bottom lands in Kansas and other parts of the West this method of corn culture has been very successfully practiced for a number of years, and the use of the lister is being rapidly extended. The advantages claimed for this method are: 1, that the crop may be made at one-fourth less cost than by the old method; 2, that the yield per acre is considerably increased, and, 3, that listed corn endures dry weather better than that planted by the old method.

The Influence of the First Male Parent.

J. H., Fullerton, Neb., says, if as is claimed, when a heifer is got in calf by a good pure-bred bull, the influence of the first male parent extends to the future progeny of the female, then it follows that the next calf by the same parents would be perceptibly improved, and he asks how many calves must the same parents have before the progeny become pure-bred.

ANS.—The influence of the first male parent upon the future offsprings of a female has been noted only where those offsprings have been begotten by other males. The influence is most intense in the first impregnation, and is very much slighter in subsequent impregnations by other males. If the female is covered by the same male in different impregnations, how can the dominant influence of a first impregnation be detected? This peculiar influence is not confined to cattle, for it has also been noticed in other members of the brute creation as well as in human beings. This is not a matter of opinion; but a matter of fact, of which numerous well authenticated instances are on record. Of course, it is not maintained that the influence is always apparent, but there are too many striking examples of it to permit its existence to be doubted. How often does it not happen that a mare bred to a jack, afterwards produces colts with mulish characteristics when bred to stallions! All the standard works on breeding are full of instances of this influence in cattle, horses, sheep, swine, dogs and humans, and numerous cases in point are mentioned from time to time in the agricultural press.

Keeping Grapes, etc.

J. B., Arkansas City, Kansas, asks, 1, how to keep grapes fresh for Winter use, to make unfermented wine; 2, how to kill crickets in a well.

ANS.—1. Those who want to keep grapes for a long time should grow for that purpose only the tough-skinned varieties. Concord, Martha, Wilder, Goethe and Elvira have a very thin skin and cannot usually be kept much longer than Oct. 1; but Lindley, Ives, Catawba and particularly North Carolina can be kept for months, as they have a tough skin. Rogers's No. 2, Norton's Virginia, and Cynthiana, Mr. Husmann says, can easily be kept all Winter, though they will shrivel somewhat while remaining spicy and good. Grapes that are to be kept should be fully ripe and gathered only in dry weather; the bunches should be cut carefully, and all unripe, shriveled or decayed berries should be carefully cut out. They should be kept in an even temperature of 40°. They will keep the better if stored in pure dry sand, or if fine paper is put between the layers; and the room should be properly ventilated. 2. Cement the sides if of stone or brick. We should need to know more of the construction of the well.

Miscellaneous.

E. F., Providence, R. I., asks the addresses of some persons who are successful in raising early lambs for market, as he would like to visit such establishments to learn the business.

ANS.—It would hardly be right to give away the names of parties engaged in a special business in which skill and particular experience, often gained at great cost, are the elements of success, without their consent. Usually such persons are quite reticent when interviewed by a possible competitor, and object to "giving themselves away" after building up a business for some years with much care, and especially as this business is desirable only because special care and knowledge are necessary for success, and few there be that find these. The localities where raising early lambs for market is chiefly carried on, near New York, are Orange County, Ulster County and Westchester County, N. Y., Sussex, Warren and Morris Counties, N. J. There are no "establishments," so to speak, of this kind; the sheep are kept in small flocks of 10, 20 or 50, and as adjuncts to ordinary farming, or upon farms where there is sufficient pasture land that is unsuitable for cultivation. Around Middletown, N. Y., and Newton, N. J., some flocks kept for this purpose could be found.

N. C. J., Westhampton, N. Y., wishes to have his cows covered by a well-bred bull, but his neighbor's scrub bull is constantly getting into the lot with them, however carefully he guards against his doing so, and he asks, 1, whether the neighbor is justified in keeping so unruly a brute. 2. Wishing to make a line fence of barbed wire, he asks whether his neighbors can collect damages if their cattle or horses get hurt by coming in contact with it.

ANS.—You can sue a neighbor for trespass for permitting his bull to come on to your land, providing your own fence is a legal one. You can recover any reasonable damages for the mischief he may do among your cows. 2. You are liable for any damage that may happen to others' cattle from your barbed wire fence. The legal maxim applicable to both of these cases is, "One must so use his own property as not to injure another's."

"Comet," West Haven, Conn., wishes to seed down to grass, the coming Fall, a field the soil of which is a light sandy loam. Timothy and Red Top are the prevailing grasses thereabouts, but they do not thrive on that field, as they soon run out, being succeeded by daisies, and our friend asks, 1, what mixture of seed would make a thick sward and be likely to exclude weeds; 2, what good grass can be grown with Orchard Grass that will ripen at the same time.

ANS.—1. We would mention Rhode Island Bent Grass (Agrostis canina)—two bushels to acre or less; Sweet Vernal Grass (Anthoxanthum odoratum)—20 pounds to acre; Meadow Fescue (Festuca pratensis)—25 pounds to acre. 2. We know of nothing better than Kentucky Blue Grass (Poa pratensis)—two bushels per acre or less.

S. G., Church Hill, Md., wishing to start a small fruit garden, asks what kinds of strawberries, raspberries, blackberries, currants, gooseberries and grapes would we recommend for family use.

ANS.—Our advice in such cases must be taken with many an allowance. Strawberries: Sharpless, Bidwell, Cumberland Triumph, Charles Downing. Raspberries: Cuthbert, Turner, Gregg, Caroline. Blackberries: Kittatinny, Snyder. Currants: White Grape, Cherry, Old Red Dutch and Fay's Prolific. Gooseberries: Downing, Houghton's Seedling. Grapes: Concord, Lady, Brighton, Lady Washington, Duchess, Prentiss, Pocklington. For suggestions as to ornamental shrubbery, trees, etc., our friend is referred to our Hardy Shrub and Tree Number.

W. F., Florence, Texas, asks where can he get Clawson and Shumaker wheats and whether they are smooth or bearded.

ANS.—Any seedsman can furnish Clawson, which is a smooth wheat. We do not know whether Shumaker (sometimes spelled Shoemaker) is at present offered or not; but so good a wheat is sure soon to find its way into seedsmen's hands. It is a smooth sort.

C. L. H., Mercer, Mich., says, 1, "I am sowing perennial flower seed now, shall I transplant this Fall or next Spring? 2, how can I propagate Hydrangea grandiflora and when?

ANS.—1. Next Spring. Cover lightly this Fall. 2. Make cuttings of the nearly ripened wood. Place them in boxes of sand and keep moist. Branches which rest upon the ground root freely if held there.

E. W. B. desires directions for treating the Japan Red-bud.

ANS.—At this season of the year it would be best to start them in pots so as to remove the young plants to the house for the Winter. Plant the seeds in well-drained pots and cover with pieces of glass until they germinate.

H. T., Wessells, New Jersey. The white chaff must be Fultz, though the breasts are rather too far apart for that variety. The other is as near Clawson as any we know of. The kernel seems too dark, but this may be owing to the fact that it is shrunken somewhat.

L. B. R., Buckland, Mass., says that while attending an exhibition of the N. Y. Horticultural Society he marked a strawberry called the Battey Seedling as good, and he asks whether it is the same as the Manchester lately commended in the Rural.

ANS.—Yes.

G. C., Green's Landing, Pa., wishing to send some heads of Spring wheat for competition for the RURAL premiums, asks for more time, as they will not be ripe by August 1.

ANS.—Send them so soon as they are ripe, please.

C. B. asks how to rid his garden and lawn of moles.

ANS.—We are sorry we cannot help our friend. Soft tar runs into their holes here and there is offensive to them.

J. W. S., Ash Grove, Mo., asks whether Navy Bush Beans run.

ANS.—Nearly if not all bush beans will occasionally "run" if planted in rich soil.

M. J. M., Le Roysville, N. Y., sends for name what he considers the worst weed in that section.

ANS.—Hieracium scabrum—Hawkweed.

F. D., Snyder, New York. We are not positive as to the name of the bearded kind of wheat with Fultz. Thanks for specimens.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JULY 30.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, AUG. 6, 1881

WE again request that any reader having heads of the so-called "Golden Grains" Wheat will please forward specimens to us.

MANY FARMERS use a spoonful of bone flour to each hill of corn. This is at the rate of at least a bag or barrel—200 pounds—per acre. The spoonful can only help the corn plant while very young. We should much prefer to sow the 200 pounds broadcast, which would exert an influence upon the plants during the entire season.

WE HAVE A LITTLE PATCH of Bermuda Grass growing at the RURAL FARM. It grows in a very dry, sandy place and is beautifully green now when all other grass—except it may be Quack—is burnt. The color is a blueish-green like our Northern Blue Grass, Poa compressa. We shall give an illustration of this grass and its singular growth in due time.

WE MAY NOW (July 26) state positively that not one of several kinds of Sorghum or Doura sent to us from various seedsmen and others, thought to be the Rural Branching Sorghum, proves to be so. Three specimens were sent from California, one from the South, and three from Eastern seedsmen. The best of these show but three branches, or tillers, or suckers, from one seed, which, if cut back, make no further growth of any account, while the Rural Branching, if cut just above the ground, seems to grow faster than before and to produce additional branches. Our subscribers are now asked to try the experiment.

NEXT TO SPRING, August is the best time to set strawberry plants. Several announcements of small-fruit growers' catalogues appear in this number, which will be sent free to all of our subscribers who apply to those who announce them. Pot-grown plants, if properly pot-grown, will produce nearly a full crop next Spring. All things considered, however, we prefer those which are not so prepared. Those who order strawberry plants and receive them in bad order, should return them to the seller at once. It is his duty to send out healthy, vigorous plants and he should be held to it, the same as any merchant is bound to furnish merchantable goods when they are bought and paid for.

SINCE LAST SPEAKING of the experiment corn field at the Rural Farm, the corn has been growing finely and now promises a fair yield. We have, however, to fear the drought and then, should this be safely passed through, that the season will not be long enough for it to ripen. The manured acre is far ahead of the rest, and is easily distinguishable without any need of guidance from the stakes which mark it out. The specially manured plots of one-twentieth of an acre each are very variable. Some seem to be harmed by the fertilizers applied; on others they seem to have produced no effect and on still others a marked benefit. The advantage of flat cultivation and having the plants stand a foot apart instead of crowded together in hills, is very apparent during this drought. The leaves up to this time have curled far less than those of neighboring fields.

ILLITERACY IN THE UNITED STATES.

INTERESTED as we are in whatever affects the welfare of the country and the millions who inhabit it, we do no less than our duty in calling the attention of our readers to some facts on education, which were elicited at the recent University Convocation at Albany. The census of 1870 revealed the fact that there were in the United States, 1,580,000 illiterate voters, of whom 1,123,000 were in the Southern States. This would leave 457,000 for all the other States, which, though a comparatively small proportion, is yet in reality a large one where educational institutions are our boast. Of these 457,000, New York has 77,000 and Pennsylvania 67,000, while the other States, with fewer great cities, have a less number of illiterates. Ten years ago one voter in five could not read the ballot he cast into the box, and now advance sheets of the census reports show that this illiteracy has been greatly on the increase, and that over 21 per cent. of the 9,297,000 votes at the last general election, were cast by the illiterate.

These facts are sufficient to show that there is great need of extending the privileges of the common schools, and of enforcing attendance, if need be, upon those for whose benefit they are established. The rapid growth of cities and a corresponding increase of illiteracy are unfavorable omens for a people such as ours, whose welfare depends on the right use of their privileges, the greatest of which, it may be, is now threatened by misuse. It is gratifying to know that these facts are being considered by the people, and the sooner the General Government aids the several States in this matter of popular education, according to the illiteracy in them, the better it will be. This, too, is a question in which the farmers of the country should have a deep interest, and they should not deem it sufficient that their sons can read the ballot they deposit, or think that a *very* common education is all that is necessary. Much depends on the education their sons receive in enabling them to counterbalance by their intelligence the vast and increasing power of the illiterate.

A MONOPOLY OF RIVER TRANSPORTATION.

A COMPANY, it seems, has just been organized in this city for controlling the freight transportation on the Mississippi, Missouri and Ohio Rivers. Sixty-three steamers and 120 barges, it is reported, have already been bought at their actual value. The purchasers claim that they can run them at a reduction of $800,000 a year from present expenses. Mr. James R. Keene, widely known as an extensive manipulator in "corners" of wheat, pork and other farm products, as well as a bold speculator in railroad stocks, is said to be at the head of the company. Its projectors say they are now completing arrangements by which grain and provisions can be shipped to Europe at little more than half the prices now ruling via rail and the Atlantic ports. The company, it is said, has already bought all the warehouses on the three rivers except those owned by the railroads, and others are to be at once built by it at New Orleans and other points. It is expected that a vigorous competition will be at once begun with the railroad companies in transporting the surplus of our present harvest to foreign markets. In spite of the objections that can always be urged against a monopoly, this new company is likely to be of considerable benefit to agriculture in the way of cheapening freights on farm products from points at which water and rail transportation come into competition. The large capital at the command of the company will probably develop the former within a few months to an extent it might not otherwise have attained in as many years, besides enabling it to fight against mighty railroad corporations with better chances of success than could be hoped for by punier organizations. From the contention of these powerful monopolies the public is pretty sure to be the gainer, on the principle that "when rogues fall out, honest men are likely to get their due."

THE SIBERIAN PLAGUE.

THIS disease which has lately occasioned great fatality among cattle and horses as well as many deaths among the human inhabitants of several Russian provinces, and especially in villages near St. Petersburg and along the railroad line thence to Warsaw, has been identified with malignant anthrax, or carbuncular erysipelas, various forms of which are commonly known as black leg, black quarter, black tongue, charbon, bloody murrain, etc. This disease Exodus tells us constituted the 5th and 6th plagues from which the Egyptians suffered in the days of Pharaoh—plagues there described as "a grievous murrain," and as "a boil breaking forth with blains upon man and upon beast." In the true sense of the term, it never becomes epidemic so far as the human race is concerned, but it not uncommonly becomes epizootic among flocks and herds, especially sheep, goats and camels in Eastern Europe and Asia, especially in the Russian possessions. It is essentially a disease of the lower animals, appearing in man only in sporadic cases, and only among those that come in contact with infected matter. It has caused considerable fatality, however, among the wool sorters in England, especially in the West Riding of Yorkshire, the chief seat of the worsted manufacture, where it is known as the "wool-sorters'" disease. In the Spring of 1880, the Local Government Board ordered a medical investigation into the nature and cause of the malady, and the Inspector who conducted the inquiry has lately reported that it is due to the importation of infected wool and hair, chiefly from Asiatic Russia. It has its origin in a low parasitic vegetable organism, called Bacillus anthracis, which soon dies on its removal from living blood, but its spores or germs may, in ordinary circumstances, retain vitality and power of development for an indefinite time. In one form or another this disease causes more deaths than any other among the flocks and herds of this country.

RIVAL WATER ROUTES.

PROBABLY there is no question, political, social or commercial, that now agitates the West, and especially the trans-Mississippi region, so deeply as that of transportation. All over the broad Western country farmers, merchants and business men generally are alike alive to its importance, and politicians of all parties are already shaping their policy with reference to it. The belief in the oppression of railroads is earnest and widespread, and the prospect of successful competition by water routes is hailed with hope and exultation, not, however, as a final settlement of the grievance of railroad extortion, but as a beneficial makeshift until appropriate legislation shall have curbed such exaction. While the whole Western country is, however, unanimous as to the desirability of water transportation to the seaboard, there is some difference of opinion in regard to the most desirable route. St. Louis, Hannibal, Burlington, Keokuk and other towns below Rock Island and west of the great river favor the Mississippi route, while Davenport, Dubuque and the upper river towns prefer the proposed canal from Rock Island to Hennepin, thence by the old canal to Chicago, and thence by the lakes and the Erie Canal to this city or by the lakes and the Welland Canal to Lake Ontario, and thence, by the St. Lawrence and the short canals that circumvent its rapids, to Montreal, which, though 600 miles from the mouth of the River, is the great sea-port of Canada. The bugbear that until lately frightened off traffic from the Mississippi route, was the notion that grain would heat in transit—a delusion now exploded. Not only does this route communicate directly with numerous parts of the mighty Mississippi Valley by natural channels, but below St. Louis it is seldom frozen up, while its northern rivals are closed by frost for five months in the twelve. The South and West are constantly making demands on the whole country through Congress, to improve the river route by removing obstructions to navigation, building levees and straightening channels; Canada is now spending $30,000,000 in improving the Welland Canal and those along the river, and showing a disposition to reduce rates as low as competition may require; while New York has already abolished tolls on westward-bound freight on the Erie Canal, and initiated a movement for amending the Constitution so as to permit all tolls to be done away with. Doubtless before long, too, the requirements of commerce and competition will force this State to enlarge her great water-course—a measure which has already been strongly urged upon the Legislature. This great competition of rival water routes to the seaboard is destined not only to greatly reduce freight charges by rail and water, but also to influence the direction of traffic, and consequently the relative growth and importance of the chief shipping ports on rivers, lakes and seboard.

BREVITIES.

GIVE your babies *ripe* blackberries; give them to your children and eat them yourselves.

IF no other work presses—plow, now that harvest is over. It will equalize farm work, destroy weeds, give a better fitting for wheat or rye, and, finally, will assist farmers to sow earlier.

AFTER a heated struggle of several months' duration the Irish Land Bill has at length been passed by the British House of Commons without any very material alteration from the shape in which it was originally introduced by Mr. Gladstone. It is now before the House of Lords, who will hardly dare to make any grave changes in it, and thus enter into dangerous contention with the popular branch of the Legislature.

AT the late great cattle and dairy show at Birmingham, England, the silver medal for the best cheese was borne away by Jubal Webb, who has been styled "the Cheese Fiend," on account of his indefatigable exertions in procuring the very best American cheese. That which obtained the prize was one of the largest cheeses ever made, weighing three-quarters of a ton, and it came from Iowa.

TOMATOES, cabbages, etc., growing in gardens or plots that are likely to be injured by drought may be carried through by the following simple method:—Hoe the earth about each plant so that the hollow thus made will hold half a pailful of water. To the water a pint of liquid manure may be advantageously added. As soon as the water has disappeared, hoe the ground nearly level, leaving it about the stem slightly concave, and cover with salt hay or something of the kind.

THE Rural Farm and the country thereabouts is suffering from dry weather. Corn is curling. It received too much rain when rain was not needed, and gets none at all now that it is in tassel and needs it most. Fodder corn is beyond help. Blackberries are drying up; peaches shriveling. The leaves of many trees are turning yellow and falling. Pastures are brown and clover is burning up. Still, immense hay, oats and wheat crops have been harvested and farmers, even though the corn crop fail, should not complain.

IT will be remembered that last year Congress made an appropriation of $25,000 for boring artesian wells on the arid Colorado lands, to see if by their means water could be obtained in sufficient quantities to supply stock or for irrigating purposes. Reports from Washington declare that this appropriation has been entirely expended, while not a drop of water has yet been got out of the solitary well which Gen. Le Duc sank to the depth of 450 feet near Fort Lyon. Another appropriation of $10,000 was made at the last session of the Forty-sixth Congress to continue the experiment, and Commissioner Loring, warned by the failure of his predecessor, has employed Prof. C. A. White of Greeley, Col., and Prof. Samuel Aughey, of Lincoln, Nebraska, to explore the dry region and locate the best place to sink the well, the work at Fort Lyon being suspended until these gentlemen make their report.

SOME doubt has existed as to the light in which Commissioner Loring views the sorghum sugar making business of the country; but a late letter of his to the Hon. S. H. Kenny, President of the Minnesota Amber Cane Association, removes any apprehension of lukewarmness on his part in promoting the welfare of this promising industry. After promising his hearty co-operation, so far as practicable with the means at his disposal, in the Association's efforts to extend and perfect the manufacture of sugar from sorghum, he says, "The production of sugar in this country that shall successfully compete with foreign markets, and supply the constantly increasing demand, is an object of commercial, as well as agricultural, importance, and may well engage the attention of our farmers. * * * Such encouragement, therefore, as is compatible with other interests and legitimate obligations of this department, it will give me pleasure at all times to extend to your praiseworthy pursuit."

THE newly appointed Cattle Commissioners will hold their first meeting, to arrange a plan of action, at Saratoga, N. Y., on the 10th inst instead of assembling at Washington on the 1st., as at first designed. Judge French, Asst. Secretary of the Treasury, who has always taken a deep interest in the subject and chiefly through whose instrumentality the appropriation of $15,000 for the commission was made, has charge of the matter on behalf of the Treasury and will sit with the Commissioners and assist in framing the rules. The object of these will be to discover precisely where contagious pleuro-pneumonia exists in this country; to take measures for stamping it out there and for preventing it from spreading to other places; and to insure that no affected cattle shall be exported. The fact that all American cattle imported into the United Kingdom must now be slaughtered at the port of debarkation 14 days after landing, causes a loss of from $10 to $25 per head—a serious loss to raisers and shippers of cattle here. It is pretty confidently expected that on account of the precautions to be taken here for the shipments of sound cattle exclusively, the order of the British Privy Council on this subject will soon be greatly modified so as to allow the animals to be fattened after landing and to prevent the frequent necessity for forcing their sale on an over-stocked market, but in view of the growing demand across the water, for the "protection" of home industries, we do not share, to any great extent, in this confident expectation.

THAT 200-acre experimental tea farm of the Department of Agriculture at Summerville, near Charleston S. C., seems to be a poor investment even at the rental of $1 a year. Mr. Sanders, of the horticultural branch of the Department, who was recently sent south by Commissioner Loring to examine it, has reported that it is an exhausted plantation literally worn out by successive crops taken from it without care or fertilization. The soil, according to report, is poor, hungry sand, some portions of which might once have been classed as poor sandy loam, but it now supports only the scantiest sort of vegetation, and there is scarcely a trace of loam. On the place there is an old ramshackle mansion formerly occupied by the governor of the State, and so far the Congressional appropriation of $15,000 seems to have been mainly spent in the partial removal of this old structure preparatory to rebuilding it, and in laying out an avenue through the grounds. The report states that at present about $300 per month are expended for the supervision of $60 worth of labor, and that the climate is too cold to grow strong tea. Mr. Sanders recommends that the farm be abandoned, one person being retained to take care of the tea plants already there, and advises that experiments in tea culture, if they are to be continued by the government, should be carried on in Florida. As we have several times stated, while telling our readers what is known about tea culture, we have never had much faith in the profitable cultivation of the plant in this country under the present condition of the labor market, and we shall not therefore be inconsolable should Commissioner Loring decide altogether to abandon the experiment.

Miscellaneous.

THE NORTHWEST.

Facts About Clay and O'Brien Counties, Iowa.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

IN writing of Clay and O'Brien Counties we will endeavor to state tersely the truths which can be substantiated by any one interested, and it should be remembered that the RURAL cannot, knowingly, be subsidized in behalf of any error.

These counties are the second and third east of Dakota, in the second tier south of Minnesota, each being 24 miles square, and each containing 16 Congressional townships (six miles square) and an area of 368,640 acres, of which between one-fourth and one-fifth is under cultivation, by a population officially given by the last census at 4,800 for Clay and 4,155 for O'Brien, now safely estimated at 11,000 for the two, so rapidly are they advancing.

Their entire topography is gently undulating prairie, more marked in its elevations and depressions in the southeast part of O'Brien, and more level north and south through the center of Clay, in the northeast quarter of which is a cluster of four lakes, Lost Island, Trumbull, Swan, and another. The Ocheyden and the Little Sioux Rivers flowing south, form a confluence at Spencer. In this county are also five creeks and several streamlets, and a number in O'Brien, which secure ample water for stock and good surface drainage.

The soil in the southwest corner of Clay, and in the most of O'Brien, is a silicious marl, or a species of bluff deposit, but in the remainder of the area it is alluvial, both being very rich and productive and varying in depth from 20 to 36 inches, overlying clay and sub-strata of gravel. Though there is some low land, it is not waste land, and 'tis very desirable for grazing and pasturage. In both counties there are numerous artificial groves of timber, as their culture secures, by State law, a rebate from taxation; besides, there is natural timber along the streams and in small bodies in different localities. Lands range in price from $4 to $10, and farms from $7 to $15 per acre. Of the latter but few are for sale, only where some man, by misfortune or mismanagement, is obliged to "go West." The sale of lands in these counties this year is estimated at over 30,000 acres, fully one-fourth of which is already under the plow.

FLAX CULTURE on new breaking has given fresh impetus to this interest and to the improvement of the lands, which it helps to subdue while yielding a liberal profit. About three pecks of seed to the acre, which may be sown from the middle of May to the 10th of June upon the sod, will yield an average of seven or eight bushels. Flax is also largely raised here upon older ground, yielding 12 to 15 bushels per acre. A careful estimate places the number of acres of breaking sown to flax this Spring at 7,500, and the quantity of seed sown in both counties, on old and new ground, at 12,000 bushels. The Northwest is taking the lead in the practical exclusion of imports of Calcutta linseed. The receipts of flax-seed in Chicago for 1880 were 3,033,491 bushels, which will doubtless be increased about 80 per cent. in 1881, and Northwestern Iowa will be the most prominent factor in this exhibit. Harker & Dean, of Storm Lake, Iowa, are helping immigration practically. Having purchased a large quantity of land, they pay $2 cash per acre for breaking, furnish flax-seed to sow the sod, pay half the expense of thrashing, and give half the crop of flax, and when the land is under cultivation sell it to the same parties, if they desire to purchase, on easy terms. Mr. B. F. Felt, Jr., Hartley P. O., is their superintendent. All crops are now looking well; wheat, oats, corn, flax, domestic grasses, in fact everything gives promise of nearly an average yield. More attention should be given to fruit, and in the infancy of a farm there should be planted a good orchard.

Yet, with the flattering statements already made there is no branch of industry which is as well adapted to this country, or, pays as large and sure a profit as stock-raising. The natural grasses are abundant and nutritious; water is in ample supply and pure, the climate healthy and invigorating, both counties provided with a herd law, and with these advantages great interest is taken in buying blooded stock, so that herds of good grades of Short-horn strains are large, numerous and increasing. From one of the leading stockmen we learned that stock pays an average of 30 per cent. per annum net profit, which is certainly better than clipping 6 per cent. coupons. Closely allied to this is the dairy product: the conditions named above insure good butter; and the reputation of Iowa Creamery in our Eastern cities, renders comment needless The farmers, too, can realize more for their cream by patronizing the creameries than in any other way. To emphasize the extent of this interest, we heard that Penfield, Allen & Co. were starting a creamery at Spencer with a capacity for making 2,000 pounds of butter per day. They will make, the present season, 600 to 800 pounds daily; they practice the cream-gathering plan, and will use horse-power this season, but will probably require steam next year.

The educational interests of these counties are well sustained, and exhibit the characteristics of an intelligent, cultivated and enterprising populace.

The Iowa and Dakota Division of the Chicago, Milwaukee, and St. Paul Railway supplies them with the benefits of the two great Western markets—Milwaukee and Chicago; and the road connects in the same depot at Chicago with the Pittsburg, Ft. Wayne and Chicago Railway, and this in turn connects at Pittsburg with the Pennsylvania Railroad, making the best and most direct route from the East to these counties. The R. R. Co. have stimulated settlement and improvement by selling a large quantity of their lands here and allowing rebates upon the price, where breaking is done the season of purchase. Their agents are J. L. Hewitt at Spencer, and Harker and Green at Sanborn. The Chicago, St. Paul, Minneapolis and Omaha R. R. passes through O'Brien Co., making connection with the lumber districts of the north and all prominent markets in the county. Other roads are anticipated in the early future. The valuations of property are:

Real Estate, Clay Co.		$1,152,849
Personal,	"	220 481
Railroad	"	97,240
Real Estate, O'Brien Co.		1,028,000
Personal	"	152.000
Railroad	"	119,000

These are the assessed values, being about one-third of the actual figures; and, considering the difference in estimated worth, the taxes here compare favorably with those of older and wealthier Eastern localities. Homesteads and land grants, exempt from taxation, have also tended to make their taxes higher than they will be from this time onward.

We have spoken of cattle—a word more of other stock; many flocks of sheep grading into pure Cotswolds are noticeable. Berkshire and Poland-China hogs have supplanted the "prairie rooters" by thousands, and many are turning their attention to a finer stock of horses, both draft and roadsters. Among these are Geo. W. Sherwood with a 640-acre farm two miles south of Sheldon, 320 under cultivation. Beside his stock of cattle and hogs, he has about 25 good mares, and several blood stallions. Mr. Sherwood, and W. T. Williams (Sheldon) are doing much to raise the grade of stock in this section.

SPENCER, The county seat of Clay County, is a pretty prairie site with wide, clean streets, good side-walks, comfortable residences, and a supply of business houses, elevators, etc.; many trees have been planted, and lawns, shrubbery, flowers and other evidences of æsthetic taste are receiving attention. Its growth is marvelous, from a population of 342 in June, 1880, it now numbers about 1200, and there are at present over 60 buildings in process of completion. There are six religious organizations with three church edifices, and a fourth under contract; a graded school of four departments under efficient teachers, and a remarkably vigorous local press, including the Clay County News, a seven column quarto, in its eleventh volume, by C. M. Whitman; the Spencer Reporter, a nine-column folio in its fourth year, by A. T. McCargar. Both flourish upon their merits, *sans compliments*. "The Owl," a monthly real-estate journal is published by J. B. Edmunds. From its name it should impart wisdom. Civic societies, and social privileges equal those of Eastern villages. Surrounded as it is with a fine agricultural district, it ranks high as a shipping point; probably a ton of butter is handled here every day and from one to seventeen car-loads of stock are shipped daily in the season, and this year the shipment of flax-seed will be immense. Every line of trade is well represented and prospering. By the way, we found here one stock of goods in gents' furnishing and boots and shoes, that in quality, display and prices, is really metropolitan, and entitled to special notice and commendation. Spencer is now well supplied by the C. M. & St. P. Railway, but the people are hoping for connection with the Wabash system, via Des Moines, securing competition South and East. There is an excellent opening here for a foundry, steam flouring mill, flax mills, both oil and fiber; canning and packing establishments, light manufacturing, and a good hotel building. We were nicely entertained by Frank Daniels of the Gregory House, but his building does not meet the demands of the public or his own wishes. Griffin and Adams (bankers), A. W. Miller (Clay Co. Bank), J. P. Edmunds (banker), C. S. Penfield (loan agent, and creamery), A. Hubbard (attorney), J. L. Hewitt (R. R. Agent), all dealing in real estate, extended us valuable assistance, which deserves public recognition as representatives of THE RURAL. Address any of them (inclosing return stamp), and you will be sure of a courteous answer. We are also under obligations to Evans Bros., liverymen and proprietors of the stage line from here to Spirit Lake.

SHELDON, with a population of 1,000, is a pretty town at the crossing of the C. M. & St. P. and C. St. P. M. & O. railways on the west side of O'Brien County. It has five religious societies with three churches; civic societies, too, are well represented; there is also a graded school—four rooms, with three teachers; well conducted. We compliment the town on having such a thoroughly first-class paper as The Sheldon Mail by F. T. Piper, an eight-column folio completing its first decade. A local press is regarded as a kind of mirror, reflecting the general characteristics of the majority of the citizens. There is a large steam flouring mill, as well as three elevators, and a lively business in all departments.

SANBORN, eleven miles east of Sheldon, on the railroad, with 436 population a year ago, now numbers over 700, and is steadily growing. There are three religious orginizations, with one church building, A. F. & A. M. There is a good school; folks expect to erect a large school building this season. The O'Brien Pioneer is a newsy paper, an eight-column folio, by Walker and Willets—a valuable auxiliary to the town and well sustained. Sanborn is a division point for terminal train service, next west of Mason City; it has a round-house with six stalls, repair shops, ample side tracks, a good well with wind-mill power, the best stock yards on the line west of the Mississippi River, covering five acres, with shoots for loading and a large number of men are employed. Over 50 new buildings have been erected within a year. The location is pretty; the surroundings healthy; the business men energetic. There are also a bank, stores, a hotel (the Jenkins House by A. W. Creed), shops, etc. There is a demand for a homœopathic physician, harness maker and a good stock of general merchandise.

We record our thanks as press representatives, for valuable information and assistance to Warren Walker, of the Pioneer, and attorney; Harker and Green, bankers: and Broadstreet and Day, attorneys, all of them dealing in real estate in O'Brien and adjoining counties. Any letters addressed to either regarding the town or county will receive a prompt response.

PRINGHAR is the county seat, located near the geographical center, with an intelligent, thrifty population of nearly 400; a frame school building valued at $3,000—graded school of two departments, lodge of A. F. & A. M. The M. E. Society have a church building and the Episcopal will soon erect another. The Pringhar Tribune is an eight-column folio, of neat typographical appearance and well edited by C. G. Bundy. Though deprived of railway advantages the town exhibits the elements of progress and improvement, and as it is now expected that the Chicago & Northwestern Railway will build through here this season, the town and this portion of the county will receive a new impetus in growth, a prospect that makes the present a desirable time for locating here. The place needs a steam flouring mill, a flax and a tow mill, and, in fact, any industry adapted to the products of the country would do well here. C. E. Achorn, of the law and real estate firm of Schee & Achorn (representing 75,000 acres of land); J. R. Pumphrey, banker, real estate and merchandizing, here and at Hartley, and Warren Walker (also of Sanborn) took each an active interest in aiding your correspondents, for which we return thanks. They also consented to answer any letters of inquiry addressed to them by parties interested.

HARTLEY is a prairie town of about 150 population, on the railroad between Sanborn and Spencer, in O'Brien County; it is laid out with wide streets and presents a fair opportunity for growth; town lots range from $20 to $50. Its growth has all been within two years and mainly since September last. The M. E. Society will soon build a church edifice. There are a substantial frame school building and a creditable district school. There is an opening here for almost any business or industry, but a harness maker and wagon shop are specially desired. J. S. Finster, alive to the interests of the town, has just erected a frame building which he will use for a store below and a hall above, affording a place for public gatherings. Several other structures are in process of construction and the town bids fair to prosper.

Literary Miscellany.

SOUND ADVICE.

"You wish to be a lawyer, John—well, I'd not say a word
Unless I felt quite certain that your longings are absurd;
I don't wish to discourage you, but then I can't consent
To board you, as I hev to do, and pay your office rent

"You've got a lusty set of limbs, and ordinary head,
And you were meant by common toil to earn your daily bread;
But thriving farm and pleasant home where man and wife agree,
Beat any one-horse lawyer's luck as far as you can see.

"If you'd been born with talent, John, you'd long ago. hev shown
That you had gifts, by stealing off to study books alone.
Now, if you've read a book, I r'ally don't know when,
Though, come to think, I b'lieve you sling a somewhat legal pen.

"Be wise, my boy, the legal ranks are more than crowded now,
And half of them who starve therein were cut out for the plow,
But they mistook pure laziness for talent, understand.
And helped to fill a big supply where there was no demand.

"Are they not educated? Yes, but here let me explain
That seed that's sown in shaky soil brings forth but little grain;
And this higher education to an ordinary mind,
Is like a pair of big gold specs upon a man that's blind.

"There is no prouder place than 'twixt the handles of a plow;
(Though stumpy land has humbled me at times I'll allow,)
And as for human greatness, I should think I had my share.
If I could take the prize for hogs at our next county fair.

"Just emulate your sire, my son, and just as sure as fate,
You'll be respected, though, perhaps, you won't be great;
But enter law, and five short years will clean you out so bad,
You'll have no recollection of the last square meal you had."

THE MANOR HOUSE.

Continued from page 506.

IT seemed to me if my room had been invaded by a host of armed men—men literally in armor, or carrying a whole arsenal of weapons, for the noise was mainly that of clattering steel and iron. The noise must have gone on for some seconds before I was perfectly awake; after that it prevaded the room for a time, then abated, but never so far ceased that I was free from the impression that I was in the company of a crowd. The room was quite dark all this time (how long exactly I never knew), and I felt extremely uncomfortable. I may go further and confess without shame that I was seized with a panic of terror—a fear so paralyzing that for the moment I could do nothing. My lights were there at my elbow, but I did not dare move a hand to reach them. All I could do, as so many of us have done in childhood, and indeed long afterwards, was to pull up the bed-clothes and try to bury myself among them. By degrees, as there was no more noise I was beginning to be reassured, when all at once the clamor recommenced, this time, as it seemed, at the very foot of my bed. There was the same hurrying to and fro of heavy feet, the same clattering and banging of steel. Then this was followed by a sudden seemingly simultaneous rush towards the windows. I heard the rattle of one of the casements, a fierce struggle, then a piercing shriek. Something heavy had been thrust out, and had dropped into the moat. I distinctly heard the splash in the water, like a great boulder rolling off a high cliff into the sea. There was another sound of feet rushing back towards the door, thence out into the corridor; and for some time I still heard them, but growing more faint, till they presently faded altogether away.

I lay quiet for some time, quite unable to sleep, but becoming gradually more and more composed. By and by I mustered up courage to strike a light. The room was as snug and habitable as ever. I looked at my watch—it was past three. Daylight was due in an hour. I fancied that there was no fear of a recurrence of my visitation, so I got up and examined the door; it remained locked and bolted as I had left it on retiring to rest. The windows, which I had so distinctly heard opened, were also securely fastened and closed.

I once more retired to bed, and very shortly went off soundly to sleep. When I awoke the sun was shining brightly into my room. I had been awakened by the old gardener, who was knocking loudly at my door. He was very anxious to know what sort of a night I had passed.

Should I tell him—cross-question him—endeavor to find out whether the same thing happened to all occupants of the state chamber? No! I felt it would be a premature confession of weakness. I preferred to go farther into this mysterious business before I admitted that I had been scared.

All that day I spent in wandering about the place, doing no work, but fixing upon the best points of view, I constantly met the old gardener. I tried to draw him into conversation. I questioned him concerning the Manor House: what was its history—was it very old? had anything odd, any deed of violence, occurred in it? when did the family last live there? and so on. All he would tell me was that it had seen many changes and chances. There had been much fighting there in times past; it had been a garrison for King Charles; it had been beleaguered and besieged, and well nigh lost to the cause through a traitor within the walls, who had betrayed it to the enemy, but who had been detected in time, and had paid the penalty of his treachery with his life.

Was this a clue to the strange noises I had heard? I determined to give the state chamber the trial of another night. But on this second occasion, although I retired to rest as before, I kept a light burning, and, having fortified myself with two cups of strong coffee, I had no desire to go to sleep. I read steadily on through the night watches—my book was a novel of Anthony Trollope's; and as two o'clock came without a repetition of the previous noise, I concluded I was not to be disturbed, and was actually on the point of extinguishing the light and turning over to sleep, when I heard far off, but distinctly in the corridor and making towards my room, a hurried frenzied movement, as of the approach of a number of armed men. Next moment my bedroom was invaded hotly and hastily by a crowd. The noises were exactly those of the night before. My burning candle made no difference whatever; the room was just as fully occupied; my ghostly visitants were as busily employed. After the same delay I heard the window opened, and the same heavy fall into the waters of the moat.

The more I pondered over this strange occurrence, the more I was inclined to think that the mystery was connected with the moat, and with the old gardener's story of a deed of violence done ages ago. I determined to question him further about this moat. Had it ever been drained off? I asked him next day. "Not that he knew of; why should it?" he replied. I suggested that stagnant water was reputed unwholesome, and that the health of the occupants of the Manor House might some day suffer. It was not likely to have many occupants, "except perhaps the likes of yourself," he remarked somewhat contemptuously, as though he thought me a fool for living there at all. Finding I could make nothing of the gardener, I went over to Blueburgh and saw Miss Maxted's agents. I pointed out that, on sanitary grounds alone, the occasional draining of the moat would obviously be of great advantage to the house. If Miss Maxted would permit it to be done, I should be very much pleased to superintend the operation. All the answer I received at first was a series of questions. Did I complain of the unhealthiness of the house? If so, I was the first who had done so, and the remedy was in my own hands. Did I propose to inflict the cost of drainage upon Miss Maxted? She could hardly be expected to meet the outlay, especially for a tenant who had in a manner forced himself upon her. Unless I had better ground for preferring my request, the answer was certain to be in the negative.

Upon this I had recourse once more to my aunt. I begged her to see Miss Maxted, and inform her that I was not quite satisfied with the Manor House. It was not exactly uninhabitable, but it was difficult to get a good night's rest there. Miss Maxted would doubtless be well aware to what I referred. I was not particularly alarmed, nor had I even been made uncomfortable. I was prepared to face even worse than that which I had encountered at Maxted; but in the owner's best interests, I wished to purge the house of the annoyance which troubled it, and if I was given full powers I thought I knew how. What I wanted was permission to have the moat drained, cleaned and thoroughly examined. Would Miss Maxted agree to this?

My aunt's answer came at length. It was very rambling and rather hysterical. She began by imploring me to leave Maxted Manor without a moment's delay. From that she passed on to a catalogue of all that had come under her notice

during the last five-and-thirty years. It was only towards the end of her letter that she referred to the matter which I had at heart. Then at last she confided to me that she had seen Miss Maxted who had seemed much surprised, not to say vexed, at what I had written. But whether this arose from concern at my sufferings in the state chamber, or annoyance at the light way in which I treated the Maxted ghosts, I could not for the life of me make out. All I could gather was that Miss Maxted had somewhat grudgingly yielded to my request, and had instructed her agents to give me every assistance in draining the moat.

So the moat was drained. The whole country side, not a very populous district, came to assist. It was not a difficult job, as the house stood at a higher level than the surrounding ground, and the water from the moat was run off into a large duck-pond near the gardener's cottage. The work was nearly finished towards sunset, and the men went off, leaving the rest of the water still to run. The moat must have been quite empty by midnight. I once more occupied the state chamber, which after the second night's disturbance I had vacated, and I sat up till two in the morning, awaiting the usual visitation. The affair came off as heretofore, but with one curious difference. The window was opened; there was a struggle, a shriek and a heavy fall—but not into water, obviously because the water was all gone. This made me all the more anxious to inspect the bottom of the moat, and I was determined to be the first to do so. Very soon after daylight I was moving, and, having dressed myself, hastened to the spot to explore. The bottom of the moat was in a filthy condition. Paved with massive blocks of granite, in which the process of disintegration was slow, there had been in all these years but a slight accumulation of muddy sediment: but the stone floor was encumbered with a thousand odds and ends, a heterogeneous collection of the most extraordinary nondescript things. Fragments of crockery and glass; drinking vessels, some of horn and evidently centuries old; scraps of various metals; the carcass of a cat recently drowned and not yet decomposed—these were what first caught my eye. There would be fine pickings for mud-grubbers and chiffonniers if they might be permitted to sift and search among these newly exposed treasures. I did not pause to turn them over myself, but made for that part of the moat which lay immediately below the window of the state chamber and peered down.

What was that lying all of a heap, like a collection of old iron at the door of a rag and bone-seller's shop. A number of pieces of iron evidently, all oxidised and corroded, covered with red rust and a deposit of slimy aqueous lichen. Without delay I clambered down into the moat and began to examine them more closely. They were clearly pieces of old armor, breastplate or cuirass, greaves, gauntlets, with a round helmet lying a little apart from the rest. I turned over everything one by one, and, to my horror, discovered within, a quantity of human bones, all in excellent preservation, each encased still in the armor which had once been their protection against mortal foes. The breast-bones were plainly distinguishable inside the cuirass, the thigh bones were within the greaves, the hands in the gauntlets; worse than all through the open visor of the morion grinned the still perfect teeth of a ghastly skull.

"These then," thought I, "are the mortal remains of some poor wretch whom revengeful or other passions have sent thus secretly, and probably without warning, to his long account. They must be taken up and buried without delay."

"Hulloa, master, what are you after down there?" cried a voice at this moment, and I saw the old gardner above, looking at me with suspicious eyes.

"Come and see for yourself. You may as well lend a hand. These bones are human bones—"

"I wouldn't touch them with the end of my long rake," he said, shuddering. "You'd best leave 'em alone too; what call is there for you to meddle or mix with these things? They don't concern you."

"I'll go bail that when these bones are buried there'll be no more haunting of the state chamber. Come, don't be an old fool. Lay hold: I'll hand them up to you, one by one."

Very reluctantly, and grumbling audibly, the gardener received the armor and the bones they encased, as I gave them to him. Then I climbed up the stone counterscarp of the moat, and with his assistance removed them all to a corner of the garden. There I made the old man dig a deep hole, and we consigned them to the earth. A small stone was set to mark the spot, in case Miss Maxted or any one might wish to reopen the rude grave.

"There, Mr. Duke," I said with a sigh of relief, "that's the end of that business. The manor House will be no longer worried by ghosts."

"Ghosts never forgive, master," said the gravedigger, gloomily. "You may think to muzzle 'em and put a stop on 'em here; but they're like weeds. If they're pulled out of one corner, 'll spring up faster in another."

"I feel certain at any rate, that they'll leave the state chamber alone."

"Maybe, and it'll not be a day too soon. But there is a curse upon the old place, I'm afeared, and if you stop here, master, you'll be troubled by them in some other way. Mark my words—in some other, worser way."

I was right, however, as to the state chamber. I slept in it that same night, and the next night, and still a third, without encountering the slightest disturbance or annoyance. After this I felt justified in writing, through my aunt, to advise Miss Maxted of the success of my operations. In due course, and through the same channel, I received the owner's warmest thanks. But doubts underlaid every line. Miss Maxted, like her gardener, mistrusted the completeness of the cure. I might be confident that the Manor House was purged, but she knew the place better, and feared that manifestations and visitations would crop up in some other shape and form. The message I received ended with a sentence which gave me, as I thought, much insight into Miss Maxted's character. "Perhaps, as I seemed an amateur in ghost laying," she told my aunt, "I might not mind exercising myself a little longer in the attempt to render the Manor a hospitable house." Miss Maxted was clearly chaffing me—making game of me—and I am not sure I was altogether pleased.

But the days and nights slipped by without any fresh occurrence. The former I spent at my easel in the air; it was perfect painting weather, and I had already several pictures well on towards completion. The latter I passed in the snug dining-room reading and dozing before the fire. I slept now always in the state chamber, and retired early to rest. One night—it was about a fortnight after the drainage of the moat—as usual I took up my candlestick soon after ten, and went through the door leading into the corridor, which, as I have said, margined all these rooms, and led to the foot of the staircase. All along this corridor, it will be remembered, were windows opening into the central court.

I had issued forth a little brusquely, as was my wont: but the moment I was through the door I became conscious that some one was watching my movements from the central court. I caught sight—I was nearly positive of it—of a partially veiled face at the passage window. It was but a momentary glimpse; directly my eyes rested upon it, it had disappeared. Yet it left a distinct impression on my mind. It could not be mere fancy or imagination. I was perfectly cool and collected, and I had a clear recollection of what I had seen. The head was enveloped in a white hood or snood, which was drawn across the lower features and concealed them, and indeed most of the face but the eyes. Those eyes! as they glittered bright and balefully in their snowy setting, I felt certain I had seen them before. But where?

To be continued.

BRIC-A-BRAC.

See the lawyer as he stands
Moving jaws and waving hands,
Telling lies he understands—
Pressing of his suit.

See the tailor, with a zest,
Like all tailors poorly dressed,
Ironing coat, pants and vest—
Pressing of his suit.

Mark the lover while he kneels;
Tell the thrilling throb he feels;
Hear the nonsense he reveals—
Pressing of his suit.

Lawyer's suit may be amended,
Tailor's suit may be a-mended
Lover's suit may be aim ended
Where the suit don't suit.

THE STORY OF AN UMBRELLA.

The Nachrichten of Basle tells a story which may give the bold purchaser a hint of a new method of protecting himself against fraudulent shopkeepers. A young gentleman bought a silk umbrella from an umbrella-dealer indefinitely characterized as C——. The next day was rainy; the umbrella was put into use, but the silk tore in six places during the first hour of its contact with the rain. The purchaser went straight to the shop, exhibited the ruined article, and demanded a sound one in its stead. C——'s silk umbrellas, however, were made to sell, not to endure use; the dealer smiled politely, and observed that purchasers ought to be careful when they made their selections. The young man took home his umbrella, painted around it the following inscription in big letters: "This is how an umbrella looks to-day which was at C——'s shop yesterday," and hired a commissionaire to walk to and fro before C——'s shop with the opened umbrella for a whole day. This unusual form of advertisement naturally irritated Herr C——, and could not have been without a deterring influence upon possible customers. C—— sent for the police, and asked them to arrest the bearer of the umbrella, but they declared that they could see no legal crime in the commissionaire's proceeding, and declined to take him off to jail. Early the next morning, the imperturbable umbrella-carrier appeared again, and he kept sentinel in this manner in front of C——'s shop for nearly a week. At the end of this period, the shopkeeper saw that he must give way, and calling the man, asked him to go to his employer and say that everything should be settled according to his wishes. When the bold inventor of the stratagem entered the shop, the dealer offered him a sound silk umbrella in exchange for the sickly one. The purchaser agreed to accept it, but added the further demand that the dealer should pay the commissionaire a week's wages, to which suggestion he was compelled to assent.

Now doth the comet serenely sail,
Throughout the cerulean blue;
Walking ahead of its tortuous tail,
And setting astronomy askew.
—Irvington Washing.

A child in a small Bavarian village was being catechised by a priest, and, asked how many things are necessary in a service of baptism, he promptly replied, "Three, father." "Ah, you stupid," retorted the holy man, "I thought everybody knew that only two are absolutely necessary; first, water, and second the Bible. Now, young sir, won't you tell me what are the three?' The boy looked up with a bland smile, and answered, "My father, the three are first, water; second, the Bible, ; and third, a baby."

"Two heads are better than one,"—on a letter that weighs over half an ounce.—Yawcob Strauss

For Women.

CONDUCTED BY MISS RAY CLARK.

THE CHILDREN.

"I'm tired of this ceaseless worry"—thus the weary mother said:
"I rise up betimes in the morning, and I'm always the last to bed;
Yet my labors are never ended, and the children's frolic and strife
Seems sometimes to drive me crazy, and I'm tired of this wretched life."

I grieved for the weary mother, for her face was worn and wan,
And a rosy bride I'd seen her but scarce five Summers gone:
But, when I looked at the children—so happy, so healthful and gay—
I spoke not a word of pity, but turned with a sob away.

For I minded how once my dwelling, now orderly, still and neat,
Re-echoed my children's voices, and the pattering of their feet.
As they scampered thro' hall and parlor, and in and out at the doors,
While dollies usurped my sofas, and picture-books strewed my floors.

And I minded the day they sickened, and their voices grew sad and weak,
As the fatal fever hightened, and wasted the burning cheek,
Till over the pale, pinched features, so changed from their winsome grace,
Crept the look—O so hard to witness!—of woe on a baby's face!

O God! Thou dost all things wisely, and I question not Thy decree!
Perchance I had else forgotten that my treasures were lent to me.
But, ah! the benumbing anguish to list for the failing breath.
As the dear form chills and stiffens in the cold, cold clutch of Death!

To-day, thro' my lonely dwelling, so quiet, precise and neat,
Where the echoes are sadly silent, I wander with restless feet;
I find not that old confusion which once did sorely annoy,
But I moan 'midst the drear precision, for the sight of a broken toy!

O courage! ye weary mothers whose labors seem never o'er;
Ah! vapid and vain your being should your little ones need no more!
My children are gone forever; but all that a mortal might strive
Were bliss—but bliss—could I clasp them safe, safe in my arms alive!

SUMMER DREAMS.

"Thus, gazing on thy void and sapphire sky,
Oh, Summer! in my inmost soul arise
Uplifted thoughts, to which the woods reply,
And the bland air with its soft melodies,
Till, basking in some vision's glorious ray,
I long for eagle's plumes to flee away."

In this noon of Summer's glory, when her radiant smile spreads a russet-glow over earth, and her brown, ripening palm showers the beautiful and the needful in lavish abundance around us, even the world's busiest toilers will pause to inhale her perfumed breath and dream,

"Forgetting awhile all their trials and strife;
The dull, cheerless factories, the long, toiling hours,"

Generally we think only of fortune's favored ones dreaming beside the crested ocean wave, or, solitary, beneath the shadow of the lofty mountain peak, as though ease and favorable surroundings alone could foster that luxury of thought and emotion. But the busiest, the humblest and the most practical have their Summer dreams. No perception so dull, no heart so callous, but it yields, consciously or unconsciously, to the subtle influence of Summer's charms, whether in the dusty avenue of the city, in the din of the workshop, or the bustle of the humblest home, so long as grass grows by the wayside, and trees retain their foliage and zephyrs fan the languid air.

Our emotions are strangely allied to external nature. Every chord vibrating in her heart finds a responding echo in our own. The brilliancy of the morning calls forth a song of joy; the languid, tremulous silence of mid-day claims—

"The voiceless thought which would not speak but weep,"

and in the solemn grandeur of the night it becomes a prayer. Youth dreaming of the golden future, age of the mellow past. One half the world expressing in song what the other half would say in sighs. One sweet influence upon different minds. We can scarcely realize or define the subtle spell, but it is upon us nevertheless,

"Filling our hearts with beauty not of earth,"

making it feel strangely tender and teaching our lips a new language of love and humanity.

They say that dreams are idle, the outgrowth of a weak sentimentalism; but we have ever found them humanizing and elevating, springing from an imaginative, generous mind to enhance the beautiful and beautify the unattractive by their magic coloring.

See, for instance, the wee bare-footed, brown-limbed bit of humanity by the roadside, intent on building a mud castle. Is not that a dream beautifying reality? Would we have it otherwise? Would we have the little hands idle, and the young, creative brain inactive, because it is only a dream? Yet what are we but older children, embryos of divine excellence to whom just such dreams serve to show and incite to live for the highest beauty and perfection attainable? The castles we build, the dreams we dream, evince a spark of the soul's loftiest aspirations.

Dream, therefore; sing, weep, pray: whatever good, or tender, or beautiful thy heart impels thee to will ennoble thy soul, enrich thy life and soften its rugged aspect! Open thy heart's sanctuary to the music of nature's thousand voices! drink in its heaven-born inspiration

"Till the toil-weary soul leaps forth from the dark
To worship its God in His temple of trees."

BERTHA A. WINKLER.

ECONOMICAL COMFORT.

WHILE traversing a road in a city's suburb I chanced to see what the seeker of comfort no doubt will be pleased to learn of. A plan so simple has perhaps, been devised by many, but as minds run in so many different channels there may remain some to enlighten. The story is this: gazing at a cottage near the road I noticed the piazza had been enveloped in mosquito netting. From the further end to, but not covering the doorway portion, it was tacked securely from top to bottom and the division between the entrance and the part fronting the windows was framed off with narrow strips just heavy enough to hold a door frame, in this was a door, the whole being covered with netting. Double width netting can be bought from 8 to 10 cents a yard, and a dozen yards probably was all that was necessary so the cost must have been trifling. The occupant had added a hammock which hung inside the inclosure and increased the picture of solid enjoyment. Those who are driven indoors by the tormenting mosquitoes and flies should invest in a few yards of netting, some tacks, etc., and make out-door like sufferable. INTEREST.

FASHIONS.

Parasols to be stylish must have a pompon of feathers or a bunch of roses on top.

Panama straw hats with the brim faced with white surah and trimmed with white pompons, are very pretty.

A popular style in millinery is to line the brims of hats and bonnets underneath with dark-colored velvet.

New Lisle thread stockings show feet entirely of lace work, with the upper portion of lace-work, alternating with widths more closely woven. The lace is either ecru, pale tan-color, lemon or tea-color, and the solid portions are Indian red, dark, blue, or else dark-brown.

Shoe-buckles of antique silver contribute such designs as stars, horse-shoes, the clover leaf and heart, as well as frogs, lizards, snakes, sheep, elephants and camels.

Ornaments for presents include a pair of tiny gold spurs, one of which is to be attached to the top of a riding boot and the other worn on the chateleine as a charm. Some spurs are ornamented with a jewel, such as a ruby, diamond, sapphire, or an emerald.

Some of the new shirred basques have gatherings which cover the shoulders only to the depth of a yoke; the shirring is then discontinued across the bust, and begins again below, the shirrs being extremely small around the waist, and becoming larger as they extend even beyond the hips to the outline of the basque. Much more dressy shirred basques have shirrings at the neck, back and front, in pompadour shape; the interval over the bust is left free, and a width of shirring appears around the waist. The skirt of the basque is then pointed in front at each side, and the much-extended and full back is festooned in the center.

Fashionable seaside toilets are now the order of the day. The latest models in elegant costumes have skirt-fronts of shaded silk, shirred across. Tunics of torquoise, lavender, or terra-cotta-colored vailing are in great favor.

A very fresh looking toilet is thus composed—skirt of Louise-blue summer satin, entirely covered with pretty bands of embroidered unbleached cambric, scalloped out round the edge, bordered with narrow lace, and gathered into flounces; bodice trimmed to correspond.

Linen dresses are made very much in the same way, and trimmed with striped materials to correspond. Outside pockets are no longer worn; the one useful pocket is concealed among the folds of the draped scarf or under the drapery of the paniers.

Little girls wear frocks of pompadour sateen, in pretty floral patterns over light-colored grounds.

Shoes of black kid, semi-high and laced, are adopted for morning toilets; the colored stocking has decidedly taken the place of the white one, which has almost disappeared. Dark colors, such as grayish-blue, garnet, purple and iron-gray, are alone worn for morning hose; for the evening light-colored silk stockings with lace clocks applied are fashionable.

Simple, useful costumes for the country or the beach are made of striped limousine, or of light cheviot cloth in tiny checks upon grounds of uncertain color. To the dress is very frequently added a small pelerine-sort of large collar, either plain or gathered upon the shoulders, lined with bright-colored silk and fastened with a long flowing bow or ribbon of the same color. This pelerine does not come down lower than the shoulders, and does not hide the waist; it, however, dispenses with wearing any other mantle for out-walking.

ABOUT WOMEN.

MISS DOROTHY DIX, well known for her services in the hospitals, is critically ill in Washington.

JAMES RUSSELL LOWELL is giving sittings in London to Anna Lea Merritt, one of the best of the young American portrait painters.

A GRAND-DAUGHTER of the famous beauty, the Marquise de Minute, has just died. Louis XV once said of her "This Minute has no second."

THREE women residing in Brooklyn, N. Y., were lately burned by kindling fire with kerosene and died from the effects. It would seem that there were lessons enough on record to prevent such occurrences; why will they not be heeded?

MRS. MARY A. LIVERMORE has been tendered a great many flattering receptions from distinguished people in London, Eng. She will sail in the "Scythia," for Boston, on the 20th of August, making her so-journ in all about three months.

MRS. ELIZA GARFIELD, mother of President Garfield is very ill and her condition is such that, owing to her age—81—it is feared she will not recover. It is to be hoped that the President will not be subjected to this bereavement in his present condition.

LASELL SEMINARY, a school near Boston, which has taken the lead in directing the education of girls toward making home life useful and happy, is making a much needed addition to its buildings, one feature of which is a model kitchen for the use of the cooking class.

MME. LA MARQUISE ANCONATI VISCONTI, of Paris, has, like M. Gambetta, a silver bath, but the bath of the President of the French Chamber cannot be compared with that of Mme. la Marquise. The water is spouted into the bath by a dolphin. By pressing his right eye you have warm water, and by pressing his left eye you have cold water. A slight pressure on his tongue empties the bath in a few seconds. The bathroom is splendid with painted glass windows and tapestries. The floor is of lava, and also the walls.—N. Y. Evening Post.

NOTE.

WORDS of commendation are occasionally acceptable by everyone, so I judge an acknowledgement of favors and encouraging comments will be appreciated by our kindly disposed patrons—these are now tendered.

Occasion is here taken to remind lady friends, as in times before, that information within our power will be cheerfully given and hints or other communications received with pleasure. Of course we are at times by necessity obliged to honor time and the waste basket, but hope not to discourage thereby. R. C.

Ice water is perfectly harmless and more refreshing with a little Hop Bitters in each draught. —*Adv.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PITHS.

VEAL and pork should always be thoroughly cooked.

A soup of tomatoes and beans is very good—a pint of cooked tomatoes to a quart of soup.

A little chopped parsley added to liver while frying improves it for most people.

Melons are very much nicer if thoroughly chilled before eating.

Never overload a plate or over-supply a table—it is a vulgar hospitality.

The sixth, seventh and eighth ribs for a rib roast will be found the choicest cuts.

When cooking Lima beans, add a handful of minced parsley just before taking from the fire.

Pork steaks, chops or sausages should be served with apple sauce or fried apples.

Custard pie with a generous dusting of powdered cinnamon, will be in favor with those who like that seasoning.

White table linen we think preferable to the delicate pinks, creams and grays which are at present so much used.

Do not neglect to dry sage, thyme, parsley, celery, etc. for Winter use. Dry and pulverize and keep in tin cans or glass bottles.

It is best to make soup the day before it is used. By so doing it can be entirely freed from fat and settlings.

Delmonico is said to allow one and a half pound of coffee to a gallon of water. His coffee is not boiled.

Fill finger-bowls half-full of water and drop a sprig of lemon verbena in each—it leaves a pleasant odor on the fingers after pressing it in the bowl.

Try boiling sweet corn in the husks. This method of cooking adds sweetness and flavor to the corn besides keeping it tender.

Large napkins—without starch—are used for dinner; small fringed ones for tea, and those of medium size for breakfast. But the last-named answer very well for all times.

Never ask a sick person what he will have to eat. Give a variety if possible, and by all means serve the food, if only tea and toast, in the very daintiest manner.

Cottage pudding can be varied by adding ripe berries, cherries, chopped peaches, in fact, almost any fruit, and it generally proves an acceptable dessert. More flour, however, should be added than when making the plain pudding.

Good bean soup can be made from the remains of baked beans. Add water and an onion and boil to a pulp. Press through a colander and season with parsley, butter, pepper and salt.

A covering of thick felt—it comes for the purpose—is used under thick table cloths; it improves the appearance of the linen, it protects the table, and less noise is made with the dishes.

When a light is needed at night and kerosene is used, by removing the fire-board and placing the lamp in the chimney, all bad odor escapes, and one can turn down the wick as low as he pleases without feeling any bad effects.

The remnants of any pudding left from one dinner may be served for the next by arranging it into a compact mass and covering it with a meringue of whipped whites and a little powdered sugar. Set into a hot oven just long enough to brown.

"Larding" is not so difficult as many cooks imagine. Little strips of salt pork and a larding needle—costing about 15 cents—to draw the pork or "lardeon" through the skin, are all that are necessary for the operation. Leave the pork in the punctures so that the exposed ends shall be of equal length.

Housekeepers who have plain white china, and who do not care to discard it or have not the wherewithal to buy new, can give a pleasing variety to their table by buying decorated coffee and tea-cups, "solitaires," or the beautiful dessert sets which can be purchased for a fraction of the cost of an entire new set.

A friend tells us that wheat pancakes, made with either sour or buttermilk, are much better if allowed to stand for 12 hours or even longer before baking. The night before wanted, add enough flour to a quart of sour milk to make a thick batter. In the morning add salt, two well-beaten eggs, and half a teaspoonful of saleratus dissolved in a tablespoonful of boiling water.

Fruit or wine stains on colored cotton or woolen goods may sometimes be removed by wetting the spots with a solution of alcohol and ammonia and then rubbing gently with clear alcohol. The fumes of sulphur will many times remove fruit stains from delicate fabrics.

DOMESTIC RECIPES.

To Can String Beans.

Remove the strings and break into two or three pieces. Boil for a few minutes and then can air-tight.

Good Rusks.

To about a quart of raised bread dough add the beaten yolks of three eggs, a cup of sugar, and half a cup of flour. Mix into little cakes and place close to one another. Rub the tops with sugar and water, sprinkle half an hour, then bake.

Ripe Tomato Pickles.

Pare ripe tomatoes without scalding and pack into jars; pour cold spiced vinegar over them.

Ripe Cucumber Pickles.

Pare and cut ripe, solid cucumbers into rings, remove the seeds, cook just a little in weak, salted vinegar, take out, drain, pack in a stone jar with alternate layers of whole spice. Cover with a sirup made of one pound of sugar to a quart of good vinegar, boiled ten minutes. Cover tightly and keep in a cool place. A. E. J.

Truth is mighty and has prevailed. See its triumph in Hop Bitters.—*Adv.*

Music Teachers

WILL NOW SELECT BOOKS FOR THE FALL CAMPAIGN,

and cannot possibly find a better book for Choirs, Conventions and Singing Classes, than L. O. EMERSON'S HERALD OF PRAISE ($1.00). which is to be the leading book for 1881-1882

Success follows success in the successive issues of Emerson's books, and this is to be no exception to the rule. *It is in press and nearly ready.* A less expensive book will be THE IDEAL (75 cts.), made expressly for Singing Classes, and except in size, is quite as good, and on the same plan as THE HERALD OF PRAISE.

SUNDAY SCHOOL MEN

will search far and long before finding a better Sunday School Song book than THE BEACON LIGHT, (50 cts.) By TENNEY and HOFFMAN. Or LIGHT AND LIFE. (35 cents.) By R. M. McINTOSH.

School Teachers

will not fail to examine our new and superior WELCOME CHORUS. ($1.00.) By W. S. TILDEN. For High Schools. And the newest and best Common School Song Book, by L. O. EMERSON, called SONG BELLS. (50 cents.)

PYRETHRUM
Cinerariæ Folium,
THE GREAT
CALIFORNIA
INSECT-DESTROYING PLANT.

This celebrated plant has been pronounced unequaled as to its value and efficacy by any other production ever introduced on the American continent. Its growth and general use will eventually destroy all noxious vermin which infest the dwellings and persons of men and the domestic animals, as well as the insects which create such havoc with the products of the soil and of human industry.

Among the eminent scientists who have given the Pyrethrum exhaustive and thorough examination and trial may be named Prof. C. V. Riley, Chief of the United States Entomological Commission, and Prof. S. Henry Comstock, of the Agricultural Department, Washington, D. C.; Prof. A. J. Cook, Agricultural College, Lansing, Mich., and Prof. E. W. Hilgard, State University, Berkeley, Cal., all of whom unite in declaring it superior and infinitely surer and safer than any other insecticide ever offered to the public.

On receipt of $5 we will send a package of seed by mail to any address, with instructions for cultivating the wonderful plant from which our G. N. MILCO'S BUHACH CALIFORNIA INSECT POWDER is made. Each package will furnish plants for two or three acres. All orders for seeds must be sent to the

BUHACH PRODUCING AND MANUFACTURING COMPANY,
154 Levee Street, Stockton, California.

News of the Week.

HOME NEWS.

MONDAY, August 1st, 1881.

The President's condition and progress toward recovery are to-day very favorable. Public anxiety has almost entirely subsided. The physicians say that he takes ample nourishment, rests naturally, the wound is acting satisfactorily, his general condition is favorable, and there are no bad symptoms or indications whatever.

The Government has issued orders to the customs authorities of New York State not to allow Canadian vessels to carry lumber to American ports in bond. Heretofore Canadian barges were able to load for New York and other American points by transhipping at Whitehall, but this new order practically shuts them out of the trade. Lumber carried in Canadian bottoms can now only be consigned to Whitehall, where there are no bonded warehouses.

A dispatch from Ottawa, Canada, on July 29, says that the revenue of the Dominion for the year ended June 30, exclusive of British Columbia, shows a surplus over the expenditure of $3,500,000.

During the decade ending 1880, Nevada was the great silver and gold producing state of the Union. Colorado now leads the van, and last year produced gold and silver to the value of $23,000,000. California came next, with $19,000,000, then Nevada, with $15,000,000. Next in order were Utah, Dakota, Arizona, Montana, Idaho, Oregon, and New Mexico.

The progress of the world during the decade between 1870 and 1880, as computed by Michael G. Mulhall, an English statistician, was as follows: Percentage of increase in population, 9.70; in agriculture, 8.58; manufactures, 18.60; commerce, 38.20; mining, 47.06; carrying trade, 53.32; earnings of nations, 19.84; public wealth, 10.57; taxes, 22.34; public debt, 43.39.

The magnitude of the shipping trade of San Francisco may be estimated by the fact that 359 vessels entered from foreign and eastern domestic ports during the half year ended June 30, 1881, aggregating 408,235 tons; the departures were 452,216 tons. The value of foreign exports was $22,044,649. The coastwise tonnage in the same time ranged from 60,000 to 70,000 tons.

Keene, Flood and Mackey are said to be preparing to build a "postal" telegraph line as a rival to the Western Union, which is to connect a number of points within a year, and make a specialty of night messages, which are to be dropped in the local post-office instead of being delivered, an arrangement which would save the cost of delivery by boys—a source of expense as heavy as the transmission by wire, and is already in operation in the Rapid telegraph company. The capital of the new company is to be $21,000,000.

Keene also heads a company just formed to control freight tonnage on the Mississippi, Missouri and Ohio rivers. The company has 63 steamers and 120 barges, and claims to be able to ship grain and provisions to Europe at half the prices by rail from the West and steamer from Atlantic ports.

The New York Legislature, before its adjournment, passed the constitutional amendment for free canals which is intended to make the Erie canal as free a water-way as the Hudson river with this difference that the State will keep the canal in order and the Federal river and harbor bill is supposed to take care of the Hudson river. The passage of the constitutional amendment now will make its consideration by a new Legislature next winter possible and, if passed then, it will come before the people in the Fall of 1883.

It takes 1000 doctors and members of the medical staff to keep the navy with 8000 men in good health, and 200 doctors to look after the army with 25,000 men. In another government medical service, the marine hospitals, which cares for none but transient patients, and in most instances for cases of slight illness, 35 doctors manage to keep themselves busy on an average of less than 800 patients a year.

The New York hoop-skirt factories are busy again with orders from all parts of the country. The crinolines are coming, beyond a doubt.

A remnant of the Modoc Indians, some 40 bucks and 30 squaws, have been committing outrages near Alamo canon in the Sacramento mountains, two Americans at least being killed. A squad of soldiers under Lieut Guilfoyle has killed one of the redskins and is chasing the others.

The main centennial building at Philadelphia is to be sold in August at public auction, and some of the newspapers are trying to have it remain for the 200th anniversary of the landing of William Penn, which comes in 1882.

They hung a judge in Colorado by vigilance committee the other day because he had let off so many scoundrels.

Gov. Crittenden of Missouri has issued a proclamation offering $50,000 reward for the arrest of the Rock Island train robbers, $20,000 of this sum to be given for the capture of the two James boys, supposed to have been the leaders of the robbery, and $6,000 each for the other five men of the party.

Prompt Action in Acute Cases.

In acute cases, Compound Oxygen has been found to act with great promptness. Says one of our correspondents: "I was suffering from cold at the time I received your Treatment—with a pain in the head, sore throat, and violent cough—*and kept getting rapidly worse*, till in a few days I was compelled to keep in my bed. *In three days I was able to get up, and was entirely over it in less than ten days*, which, considering that I am now an invalid at the best of times, is doing well; and I give the Oxygen credit." Our Treatise on Compound Oxygen, containing large report of cases, and full information, sent free. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv*

AGRICULTURAL NEWS.

THE CENSUS ON THE COTTON CROP.—The Superintendent of the Census shows that 14,432,008 acres of land were planted in cotton in 1880, and that the crop of 1879-80 amounted to 5,732,969 bales. The annexed table will show the cotton-producing States, together with the acreage and production of each for the year ending in 1880:—

States.	Acreage 1880.	Bales Produced.
Alabama	2,329,577	699 576
Arkansas	1,041,019	607,223
Florida	245,595	54,977
Georgia	2,615,568	813,965
Indian Territory	55,000	17.000
Kentucky	2,667	1,367
Louisiana	864 490	508,442
Mississippi	2,093,330	955,808
Missouri	32 711	19,733
North Carolina	892,982	389.516
South Carolina	1 361,249	522,548
Tennessee	722,501	330,624
Texas	2,168 319	801,140
Virginia	24,000	11,000
Totals	14,432,008	5,632,969

It is possible that the corrected census report will make some slight variation in the foregoing, as the returns for Arkansas, Texas and Virginia are only approximate. In the following table the products of 1880 are compared with those of 1870, the figures being in each case those of the Census Office:—

States.	Bales, 1880.	Bales, 1870.	Increase in bales.
Alabama	699,576	429 482	270,004
Arkansas	607,223	247,968	359,255
Florida	54 977	39,789	15 188
Georgia	813 695	473,934	339,761
Indian Territory	17,000	.....	17,000
Kentucky	1,367	1,080	287
Louisiana	508,442	350,832	157 610
Mississippi	955 808	564,938	390,870
Missouri	19 733	1,246	18 487
North Carolina	489,516	144,935	244,581
South Carolina	522,548	224,500	298,048
Tennessee	330,624	181,842	148,782
Texas	801,180	350,628	450,512
Virginia	11,000	153	10,817
Totals	5,732,969	3,011,375	2,721,694

A cablegram of July 27 says that a horse disease like that which appeared in this city in 1873 has lately appeared at Berlin and caused much inconvenience to the running of street cars and the employment of horses generally.....The Siberian plague among horses and humans is increasing at St. Petersburg, and has also broken out near Warsaw, where it is producing a panic.....A special to the Chicago Times from Watertown, Dakota, dated July 28, says:—"The wheat harvest begins next Monday. The crop is the best ever grown here, and all the crops are excellent. Grasshoppers are doing no injury in this section of the country. The wheat harvest on the Jim River has begun. The crops are No. 1."....A telegram from Red Bank, N. J., on July 29, says:—"Horses for the past week in this place, Long Branch, Ocean Grove and other places have suffered severely from a peculiar colic. Fourteen fatal cases have been reported. The animals in almost every case succumbed to the disease in about one hour. In a few cases they dropped dead on the road.....Freight from the Pacific Coast to the East, in the half year ending June 30, was 101,040,080 pounds, nearly all of which, excepting 4,331,650 pounds of tea and coffee combined, consisted of California and Oregon products. The wool shipment East reached 5,642,950 pounds.

The following table shows the number of homesteads entered in the different States and Territories up to the end of the last fiscal year, July 30.

States and Ter's.	Acres.	States and Ter's.	Acres.
Alabama	381,425	Minnesota	3,224,203
Arkansas	975,844	Mississippi	162,080
Arizona	4,448	Montana	88,547
California	887,802	Nevada	21,394
Colorado	297,736	New Mexico	13,083
Dakota	796,447	Nebraska	3,105,841
Florida	192,703	Ohio	7,313
Indiana	1,272	Oregon	437,328
Illinois	4 793	Utah	173,496
Iowa	831,969	Washington	340,517
Idaho	66 434	Wisconsin	1,180,825
Kansas	3,684,187	Wyoming	6,630
Louisiana	217,524		
Missouri	975,050	Total	19,265,337
Michigan	1,186,372		

A telegram from St. Paul, Minn., on July 29, says that an exhaustive review of the crop situation in Minnesota, Central Dakota and portions of Iowa and Wisconsin, based on careful personal inspection, shows about the following promise for the harvest now at hand: That the average yield of wheat per acre for the State of Minnesota and for the Red River Valley and along the Northern Pacific Railroad, in Dakota, is not quite equal to the average yield in 1879, the cause of the falling off being damage by high water on the low land and the backward Spring; that the total yield of the State and of the section of Dakota specified will equal that of 1879, the damage from the causes named being compensated for by increased acreage. Probably 1880 should be substituted above for 1879. A telegram from Chicago of the same date says: Crop reports received here from 70 of the 99 counties in Iowa indicate that the wheat and corn will not average more than two-thirds of a crop as compared with last year, the wheat especially being very poor. Early frosts would cause great damage to the corn. The chinch bugs are reported numerous in ten or a dozen counties, and they are at work in more than half of the State. The Army-worms appeared in about 20 counties, but they came too late to do much harm to the small grain. Rye is generally good, and flax-seed is very good with a largely increased acreage. Hay is good, except in low lands, where the crops of all kinds have suffered greatly. The oat crop is fully as good as last year. Many fields of potatoes are rotting. The harvesting is about half done. The late season, wet weather, worms and bugs have injured the crops as a whole at least 25 to 30 per cent.

The wife of a manufacturer in Elgin, Ill., hearing that her carriage horse, which was being used in a team, had been overloaded and beaten with a board by the driver, called the teamster into her husband's office and soundly horsewhipped him till he begged for mercy.....A dispatch from Long Branch N. J., on July 29th says: "The long-continued drought is burning up the corn and other grain in the southern portion of the country, and the dry rot and bugs are making havoc with the potato crop. The handsome lawns of Hollywood Park, comprising 50 or more acres, are burned bare.....The Australasian wheat yield for 1880-81 shows an average yield per acre of 9 81 bushels against 13.29 last year.....The Orkney Islands appear to be a good egg-producing district, as from trustworthy statistics it has been ascertained that during the last twelve months more than 11,000,000 have been exported by steamers and sailing vessels.....The Rev. W. W. Colley, recently a missionary in Africa has distinguished himself at Norwich, Conn., by declaring in a lecture that there was no barren Sahara, and that the whole country known on the maps as sterile and uninhabitable was fertile and densely populated. The wily Arabs started the lie, he explained, in order to keep out competition in the ivory traffic. Is the Great Sahara like the Great American Desert? .....Many of the clergy of the disestablished Church of Ireland are in great distress, inasmuch as those landowners who have hitherto supported them cannot now support themselves.....Reports from over 100 counties in western Missouri, Kansas, southwestern Iowa and Nebraska show a very largely increased acreage in corn, only six counties reporting a less acreage than last year. The yield will also be largely increased if the weather continues favorable. Reports from the same counties indicate that the supply of hogs to be marketed before the close of the Summer packing season will be materially less than last season.....The wheat crop in Minnesota, reported in a dismal condition, it is said by merchants who have many salesman traveling through the State, and whose duty it is to observe the crops carefully, to be very good, especially in the north, which is the great wheat region. The immense amount of buying done in New York by Minnesota merchants shows their faith in the crop.....Tobacco-growers down in Connecticut complain now the cut worms have disappeared that they have to contend with the green worm, which destroys the leaves and makes the prospect of the crop rather discouraging.....It is reported that Boston will try the ensilage system and furnish milk for several city institutions.....The Department of Agriculture says there has been an increase of two per cent in area in potatoes throughout the whole country since 1880. The increase is general in all sections. The States of New York and Michigan report an increase of five per cent each; Missouri an increase of six per cent, and Ohio a decrease of two per cent. The condition of the crop is reported very high. Insect injuries are reported in many localities, but the damage will be slight. The acreage of tobacco is largely in excess of last year, particularly in Maryland, Virginia and Kentucky. But in view of the large decrease in 1880 in these States, owing to the scarcity of plants, the area will not be greater this year than it was in 1879, the year in which the area was given for the census of 1880. The condition of the crop is reported higher than last year at the same time. .....A telegram from Cincinnati on the 29th says: The leaf tobacco market has been unusually excited this week. Sales have been made of 2,132 hogshead at an average of $11.55 per 100 pounds. One hogsheads of extra quality was sold at $65 per 100 pounds. A number of premiums for the best three hogsheads sold during the month were awarded to-day, the first to B. K. Davis, of Owen County, Ky., the second to Larkin Ferguson, of Owen County, Ky., and the third to Capt. McCormick, of Brown County, Ohio .....

Inquiries as to the prosperity of negro farmers in Louisiana were sent to all parts of the State by the New Orleans Picayune, and the replies show clearly that "it is within the reasonable ambition of any healthy colored man now to own land, and to establish himself in an independency".....A vengeful Illinois farmer has commenced 9,000 suits against a railroad company for failing to keep axes and saws, as ordered by law in that number of cars. The aggregate penalty would be $1,800,000 if the prosecution proved successful, and the complainant would receive half.....Virginia farmers in the neighborhood of battlefields are still able to gather up enough old gun barrels to supply their blacksmiths with horse-shoe iron.....Gen. John Pope has ordered Lieut. Shoemaker and a company of men to report to United States Agent Tufts, at Fort Sill, for duty in the Choctaw Nation. The troops will be used to expel white intruders. There is great excitement, and those who were ordered to leave have already sent an attorney to Secretary Kirkwood to plead their case.

THE NEW YORK PLOW CO, 55 Beekman Street, N. Y., desire the address of parties who have, or who propose to build Silos.

Goods of a Prominent Firm Counterfeited.

The Evening Star of Washington, D. C., in issue of June 25th, states that—

"Joseph L. Daniels and William S. Sammons were charged in the Police Court to-day with unlawfully counterfeiting and using certain copyrighted labels of the Rumford Yeast Powder Company."

The Company above-named is identically the Rumford Chemical Works of Providence, R. I., a house whose productions have a world-wide reputation for their superior merit. Their preparations consist of Horsford's Baking Powder, Acid Phosphate, etc., and are the inventions of Professor Horsford of Cambridge, Mass., which fact in itself is a guaranty of their excellence.

The Rumford Chemical works have had quite a number of cases similar to that alluded to; their labels and packages having been so closely copied that the casual observer was readily deceived. They are determined to proceed against infringers of their rights to the fullest extent of the law, and this course is due to the public as well as to the proprietors.

As a Cure for Piles

Kidney-Wort acts first by overcoming in the mildest manner all tendency to constipation: then, by its great tonic and invigorating properties, it restores to health the debilitated and weakened parts. Try it.—Item.

The Horsford Almanac & Cook Book sent free on application to Rumford Chemical Works, Providence, R. I.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 50 cents per box.

Thousands of women have been entirely cured of the most stubborn cases of female weakness by the use of Lydia E. Pinkham's Vegetable Compound. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

All your own fault if you remain sick when you can get Hop Bitters that never fail.

BURNETT'S COCOAINE.

Promotes a Vigorous and Healthy Growth of the Hair.

It has been used in thousands of cases where the hair was coming out, and has never failed to arrest its decay.

USE **Burnett's Flavoring Extracts**—the best.

The Markets.

CROPS AND MARKETS.

There is nothing new of special importance to mention with regard to wheat and corn. Owing to the large supply, the break in values at the West, and speculative manœuvering, wheat here, especially winter wheat was depressed during the early part of the week. This was particularly the case with graded and ungraded red, the fall on Tuesday amounting to 3@4c. per bushel. Owing to this shrinkage export operations assumed large proportions both on that day and the next, and on Thursday evening prices rose to within 1@1½c. per bushel of the final quotations last week, and since prices have been stiffening. Corn suffered slightly early in the week from the "bearish" tendency, but soon strengthened as we predicted, leaving off from ¾c to 1c higher than week before. By the way, in speaking of the average domestic consumption of corn here last week, a slip occurred in putting it at 115,000,000 bushels per month in Summer and double that quantity in Winter. It should have been an average of 115,000,000 bushels per month, about twice more being used in Winter than in Summer. The 265,000,000 bushels estimated to be on hand on May 1st, would then last about four months in Summer or two in Winter. This was a mere slip in writing hastily, but did not at all affect the truth of the conclusion reached—that corn must be high-priced until the growing crop comes to market.

The interesting features in oats has been a marked rise of 4@5c. per bushel in No. 2 white and No. 2 for July delivery, mainly because some large operators were "short" of those grades and had to pay steeply to fill their contracts. Special telegraphic advices from Virginia, Tennessee and North Carolina indicate that the peanut crop will be very short. Virginia, which raises the larger portion of the peanut crop, will, it is estimated, produce this season from 800,000 to 1,000,000 bushels, against 1,750,000 bushels last year. The crop in Tennessee last season was 730,000 bushels; this season a yield of 150,000 bushels is looked for. In North Carolina it is estimated that the crop is about one-fourth as to acreage. Similar reports were widely circulated a month or six weeks ago, but they were largely accredited to a "syndicate" who, it was alleged, had accumulated a vast quantity of Tennessee peanuts at Cincinnati and were trying to raise the price by prophecies of a failure of the present crop. There is no doubt now, however, that the crop will be unusually small.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, July 30.

Chicago.—Wheat fairly active No. 2 Red Winter, $1.14@1.18; No 2 Chicago spring, $1.19½@1.19¾ cash; $1.19¾, July; $1.19¾, August; $1 15¾; September; $1.15½, October; No 3 do. $1 03@1 06; Rejected, 77c. Corn unsettled 49c. cash; 48⅞c.@49c, August; 48¾c., September; 49c. October; Rejected, 44½c. Oats fairly active and a shade higher at 45c. cash; 30⅞c., August; 29@29⅛@29⅛c. September, 29½c. October; Rejected, 27c. Rye steady at 82c. Barley easy at 92½c. Pork easy at $18. cash, July, August, September, and October. Lard easier and in regular at $11.65@11.70, cash; $11.65, August $11.65@11 67½, September, $11.55@11.57½, October. Bulk-meats irregular and higher. Shoulders $6.60; Short Rib, $9.30; Short Clear, $9.25. Flax $1.17½ cash; $1.16, August; $1.12@1.14, October. BUTTER.—Fair to choice creamery 19@23c. per lb; good to choice fresh made dairy 16@19c; medium to fair do 12@14c; choice to fine ladle packed 15@17c; common to good packing stock 11@13c; grease butter 8@9c. CHEESE.—Prime to choice full-creams cheddars at 9½@10c per lb. fair to good do. 8½@9c; prime part skimmed do at 7@7½c; fair to flat shapes at 5½@7½c. and hard skimmed sour and poor goods nominal at 2½@4c. EGGS.—Business was dull, and the bulk of the stock offered was in poor condition. The demand was limited at 11@12c per doz, for good to the best counts. HOGS.—Market weak; mixed packed, $6@6.60; light, $6.40@6.80; choice heavy, $6 70@7.05. Cattle market dull; shipping grades nominal; common to choice natives, $4 35@6.10. Sheep market very dull.

St. Louis.—WHEAT strong; No. 2 Red Fall $1 19@1.19½, cash; $1.19@1.20, August; $1.20@1.21¾, September; $1.22@1 23½, October; $1 23½@1.25½, November; $1.19¼@1.19¾, all the year; No. 3 do., $1.10@1.11½; No. 4 do., $1.06¼@1.07. CORN 49@49¼c., cash; 49¼@49⅝c., August; 49¼c., Septem-

ber; 49@49½c., October; 47c., November; 45@45½c., all the year. OATS 44c., cash; 29¼@29½c., August; 29¼@29⅞c., September; 30½c. October. RYE dull at 99c. asked. PORK quiet; jobbing at $18 30. Bulkmeats firmer; Shoulders 6½c.; Clear Rib, 9½c.; Clear Sides, 9½c. Bacon irregular; Shoulders, $7.40@7.50; Clear Rib, $10.12½@10 20; Clear Sides, $10.45@10.60. Lard dull and nominal. BUTTER steady; Dairy, 14@22c. Eggs quiet at 8@10c. Hogs steady; Yorkers, $6 50@6 60; packing, $6.25@6 50; choice to fancy heavy, $6 60@6.90. CATTLE—Supply very light; little done; fat natives and and good grassers wanted; export steers would bring $6@6 15; heavy shipping, $5 50@6; good to choice grass Texans, $3.50@4.50; common to fair, $2.50@4.50. SHEEP—Market steady; fair demand; muttons, 3@4; fancy heavy, $4,50.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 30, 1881.

BEANS AND PEAS.—All well preserved standard white beans are firm and holders are not pressing such marks for sale. A fair trade runs on the good useful cheaper sorts of mediums and marrows. Pea beans are scarce and higher. White kidneys also doing better. Red kidneys still in overstock for present trade wants and the few sales are at between prices, best selling best. Green peas are weak and neglected at $1,4?. Southern B.E. or Canadian held of no importance.

Marrow beans, prime, $2.42½@2.45; other, $2.25@2.37½; medium, prime, $2.40@2.42; other, $2.20@2.35; pea, $2.35@2.40; white kidney, $2.25@2.45; red kidney, prime, $1.55@1.60; fair to good, $1.40@1.50; black or turtle soup, $1.30@1.35.

Receipts for week, 6,670 bush.

Exports do. 1,100 pkgs.

BEESWAX.—Demand light at 23@25c. Exports since January 1st, 80,109 lbs; same time last year, 83,500 lbs.

BUTTER.—The demand is almost fully supplied by current receipts and there has been occasion to put out speculatively held stock largely. Now and then a round buyer wants a special line that is known to be in store and when rich goods are called for the fact imparts courage to the light-crop believing owners. The quality of arrivals is not as a rule first-class and fine fresh and stored June may be noted firm but without present tendency to advance. There has been a fair eastern trade during the week which has moved some of the cheaper style of butter. Exporters have not exceeded 22½c. for the creamery they have taken and have not seemed ambitious to take it at that. The best local trade, now moderate, is using creamery almost in every case.

Creamery—Western, good to choice 21@23c; State and Penn. 23@24½c.; poor 18@20c; sweet cream, 22@24c.; State pails and h'f tubs, choice, 21@22c; fair to prime 18@21c.; Welsh tubs, 18@21½c.; poor State 16@18c, firkins yellow 20@22½c.; Western imitation creamery, 16@19c.; dairy, fine 18@19c.; other 15@16c; factory or ladle packed best 17@18c.; other 13@17c; very poor Western 12@13c.

Receipts for week, 40,138 pkgs.

Exports for week, 8,920 do.

CHEESE.—Strong prices in the country strengthened the views of some holders early in the week but the later developments of trade have shown that cheese, to sell upon its real merit, in the decision of shippers, would not exceed 11c. It may be remarked that a few fancy factory are held above figure. Western cheeses are not attractive in quality and receivers press them for sale. Skims in fair demand. No pressing surplus of any kind remains and the market closes with a fairly wholesome tone.

State fact'y, choice, colored, 11c. do. white, 10½@10¾c; fair to prime, 9½@10½c; poor fair to 8½@9½c; Ohio, flat, fine 9@9½c; other 7½@8½c; cheddar, 8½@9¾c; Wis poor to fine 9@10c. part skimmed, 6@7½c.; full skims, 3@4c.

Receipts for week, 91,603 boxes.

Exports for week, 89,592 boxes.

Liverpool cable, 55s. 6d.

Steam to Liverpool, 29s.@30s.

COTTON.—The week has been a brighter one all through. Exporters have dealt more largely, spinners have replenished a good deal, and with the "short" speculative interest covering its transactions, prices are better.

Quotations are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas.
Ordinary	8 9-16	8 13-16	8 13-16

Fair	14⅛	14⅜	14⅜

STAINED.

Good ordinary	8 3-16	Low middling	9 13-16
Strict good ordinary	9 3-16	Middling	11⅛

The averages of yesterday's forward deliveries as officially reported were as follows:—

July, 11.83c.; August 11.90c; September, 11.37c.; October, 10.70c.; November, 10.49c.; December, 10.48c.; January, 10.61c.; February, 10.73c.; March, 10 48c.; April, 10.97c.

DRIED FRUITS.—Evaporated apples show a material advance and it is thought that the light stock will support it. Old style have also improved though figures are mainly of a speculative character. No new peaches showing. Last crops nominally firm. Market quite clear of blackberries. Few ought to start well. Small fruits will not exhibit much interest until later on.

Apples, evaporated choice 11@11½c.; fair to prime, 9½@10½c; Southern sun-dried, common to best 4½@5½c; State fine cut 6@6¼c., quarters 5½@6¼c.; Western, 4½@6¼c; evaporated peaches peeled 25@28c; unpeeled 13@14c; sun-dried peeled, 17@22c unpeeled 5½@6¼c; Plums 10@12c. Cherries 17c. Raspberries 25c. Whortleberries 14c.

Receipts for the week, all kinds, 187 pkgs.

Exports dried apples, 50 pkgs.

EGGS—Receipts for week, 6,687 bbls.; do. last week 8,945 do. Western stock continues low in quality and a salable lot is an exceptional one. Supplies from other points are small, but buyers do not seem inclined to purchase as they have had such an unsatisfactory time with the bad quality of Western. Lots sold at loss off are at the mercy of the buyer in counting, and returns will be light for a time.

Near points 19c.; State and Pa. 17@18c. Canadian, 16½@17½c.; Western, fresh, 15@16c.; doubtful, 10@14c.

FLOUR.—The weather has been severe upon many low grades and they have declined. Exporters operate cautiously when their brands begin to show the effect of heat. High grades of flour especially patents have sold well at steady prices.

No. 2, ₹ bbl., $3.20@3,80; State and Western superfine, $4 25@4 60; city mills extra, $5.25@6.50; Spring wheat do. $4.75@5.10; Spring XX and XXX, $5.25@6.75; patents, $6.00@8 00; Ohio round hoop shipping, $5.00@5.40; trade brands, $5.50@6.25; St. Louis extra, $5 10@5.50; do. double extra, $5.75@6.25; do. family, $6.40@7.00; South'n shipping, $5,40@5 50; do XX and family, $6.25@7.25. Rye, $5.00@5.60. Corn-meal, Brandywine, $3 40@3.50; Western, $3 00@3.80.

Receipts of flour for week, 107 450 bbls.; do. corn-meal 4,400.

Exports of flour, 51,350 bbls.; do. corn-meal 3,250.

FRESH FRUITS.—There is quite a steady run upon the various sorts. Some extra activity is caused by the waning of some items that have a preserving call to fill. A good market is looked for as soon as consumers become reconciled to the loss of peaches. We can note the success of the "Early Alexander," a small Staten Island orchard has ripened and sold, brings $5@6 per basket. Peaches from the Pacific Coast are a market novelty. Several hundred cases have sold at $8 per case of 80 large peaches. It is not likely that California will often have opportunities like this year to enter the New York peach trade but growers are certainly to be praised for their enterprise in showing us a sample of the elegance of their product. Cal. Bartlett pears and plums are in good supply; selling at $5@7 per box and $4 per box respectively. Pears run from $1.30@1.60; plums about 200 all paper wrapped. Paper wrapping is a great point of preservation in the carrying of tender fruit and California nurserymen very profitably utilize "Chinese cheap labor" in packing in that way. There is a good offering of apples, but they are of a grade that have to be sold soon, many being windfalls and prices are easy. Muskmelons at our best supplying points are reported backward and a good season is expected for prime picking. A good variety of pears is offering.

Apples, Sweet Bough, ₹ bbl, 75c@$1; Sour 75c@$1 25; Red Astrachan $1.25@1 75; do, ₹ bu crate, 60@75c; windfall ₹ bbl.50@75c. Pears, Bartlett Sav. ₹ bu. crate, $3 00@4.00; do, Va. ₹ crate $3@3.50; Clapp's Favorite sh'n ₹ bu. crate $3@4; Manning's Eliz. do. $3@1; Jargonelle ₹ bbl. $3@3.50; Bell, M 1. $2.50@3; Burre Giffard ₹ ½ bu. crate $1@1 25; Sugar Top ₹ bbl. $3@2.50; Scooter $1.50@2.50; cooking, $1.50@2; Blackberries, Wilson, Jersey ₹ qt, 10@11c.; Md. & Del. 9@11c; wild 5@7c, Huckleberries ₹ box 75@$1.12, Raspberries Antwerp up-river ₹ 3-to.qt. cup 3@5c. Currants, Cherry, ₹ lb 4@5c; red small, 2@2½c.; black 3@4c. Peaches, Md. Hales, ₹ crate, $1.50@4.50; North Carolina ₹ bush. crate $3@5; Ga. extra ₹ 3-to-bu. box $2.50@3 50 Ga. fair to prime ₹ bush. crate, $3.50@5. Plums, Wild Goose Southern ₹ qt. 10@13c; Bunch, do 4@6c. Watermelons, Ga. ₹ 100. $20@30; Norfolk, prime $14@20; N C prime $15@25; culls $6@10 Nutmeg melons, Jenny Lind J'y ₹ bbl. $3,50@4; Md. 2.50@3; N'fk $2@2.50 citron Md. $2.50@2 75.

Peanuts in good demand and show a further advance of fully ½c. The true rise in prices is attributed chiefly to an increased Western movement, which has reduced the stock in the South.

Peanuts, Va. hand-picked ₹ lb 6@6½c. do. fancy, 5½@5¾c. do. extra prime 5½@5¾c.; do. good to prime, 5@5½c.; shelled, 3½@4c Pecan nuts, ₹ lb, 7@9c.

GRAIN.—Speculators have struggled hard to keep up an excitement on wheat and have obtained several high turns during the week. With better crop reports, however, and stocks accumulating at many important centers, the natural market closes easier and exporters have paused in their operations. Corn active and higher under a continued free export trade. Shipments abroad more than double those of wheat. Oats active and firm. Rye dull.

Wheat, Spring $1.10@1.25; do. No. 2, $1.20@1.22; do. No. 3. $1.14@1.16; red Winter No. 2, 1.25½; red Winter $1.12@1.18 white Western and State $1.15@1.26. Rye, 84@89c. Oats, white No. 1, 49c.; white No. 2, 48½@49c.; white No. 3, 46c; mixed No. 1, 49c do, No. 2 48½@49c; do. No. 3 44@46c; Corn, West'n mixed 48@50c.; do. No. 2, 57½@59c.; do. yellow, 56@59c.; do. white 56@59c. Southern yellow 56@59c.; do. white 58@60c,

Receipts for week, wheat, bush., 1,878,775.; corn, do 1 534,275; oats do. 256,386; rye, do. 2 872; malt. do. 94,300; rice pkgs. 462.

Exports for week, wheat, bush 506,625; corn do. 1,243,580; oats, do. 2,144; peas, do. 745; rice, pkgs., 1,435.

HAY AND STRAW.—Exports for week 1,075 bales hay; since Jan. 1, 147,967 do., in 1880, 73,786 do. The demand for hay is good, low prices stimulating use. Straw dull and lower.

Choice retailing timothy hay, 85@90c. ₹ 100 lbs.; second quality do. 65@75c, do.; shipping 50@55c. do.; clover mixed 60@65c; clover 35@45c. Straw, long rye 75@80c; short do. 55@60c.; other grain, 30@40c.

HOPS.—The market continues dull. Estimated remnant of hops here, 10,000 bales. Quality of this year's growth will be fine from present appearances. It is thought that the increased acreage will make up for light bearing in some sections.

State crop of '80, choice, 20@22c; good to prime, 16@19c; fair to good, 13@15c; poor to fair. 11@13c; Eastern, 11@18c.; '79's, fair to prime, 12@15c.; olds, 5@8c.

Receipts for week, 958 bales.

Exports for week, 27 bales.

MILK.—Prices for commission milk averaged $1.28 per can of 40 qts. Demand not equal to some former warm seasons.

OIL CAKE.—Western quoted $31.

POULTRY AND GAME.—Supplies of pressed have arrived ahead of the markets' wants and prices are lower with many parcels seeking buyers. It is very easy to over stock this market in Summer.

Turkeys, Phila. prime ₹ lb 15@17c. State & Western d. p. 14@16c. Chickens, Phila. Spring, 18@20c: N. J. & Bucks Co, 18@19c: Western 17@ 18. Fowls, Phila. d p. 15c. N. J. & Bucks Co. 13@15c.; do scalded 12½@13½c.; State and Western 12½@13c.; do. d.-p. 12@12 -; do coarse 11@11½c. Ducks—Spring, 15@18c old, 12@13c. Squabs, white ₹ doz. $1 do. dark, $1,25.

Live poultry has also arrived abundantly and with further free receipts expected the market closes lower and weak especially for fowls. Chickens are off fully 1c. within a day or two. Ducks and game quiet. A few stall-fed squab at $1.50@1 75 and Eng. snipe and plover at $2@2.25 complete the game list.

Spring chickens prime ₹ lb 17@18c.; other 15@17c, Fowls, ₹ lb, 13@14c; roosters, 7@8c.; turkeys, 12@15c; ducks, ₹ pair 75c@$1; geese, extra $1.75; other $1.00@1.50; pigeons, 20@30c.

PROVISIONS.—The trade has been mainly speculative in all classes of hog products; light supplies and especially light receipts of hogs have aided operators in holding up figures.

Pork extra prime, $14.00@14.50; West'n mess, new, $17.75@18. Lard, steam Western ₹ 100 lbs, $12.00; prime city, $11 75. Hams, smoked city ₹ lb 11¾@12¾c; pickled Western, and city 10¼@11; Shoulders: smoked city 8¼@8¾; pickled, 7¼@7½; rib bellies pickled, 9¾@10¼ Bacon, long clear, west. 9¼@9¾. Beef, western mess, ₹ bbl., $11@13; India mess, tcs, $27@29; beef hams bbls. $12@23.

Receipts for week—Beef, bbls and tcs, 687; pork, bbls, 2,748; Cut meats, pkgs, 21,169; lard, do 14,921. Exports—Beef, bbls and tcs, 2,126; pork, 3,641; cut meats lbs 6,337,764; lard, 2,519 005.

RICE.—Firm and fairly active. Quotations—Carolina and La. common to fair at 4¾@5¾c; good to prime at 5¾@6¾c.; choice at 6¾@7¼c.

SUGAR.—Stock quite liberal; we quote refined—Cut loaf ₹ lb 10¾c.; crushed 10¼@10¾c.; powdered 10¼c.; granulated 9¾@9¾c.; mould A, 9¾c.; confectioners' "A" 9¾@9¾c.; standard "A" 9¼@9¾c; off "A" 8¾@9¼c; white extra "C" 8¾@8¾c; yellow extra "C" 8@8¾c. "C" 7¾@7¾c; yellows 6¾@7¼c.

TOBACCO.—There is a fair home demand and but little doing for export. There is some accumulation of stock rather early in the advent of new receipts. Sales 2,989 cases, including Pa. crop of 1880 at 12@17c; do. crop of 1879 at 10@40c.; New England crop of 1880, 10@12½c., and sundries, 9@18c. Ky. sales 100 hhds. at 4¾@12¾c.

VEGETABLES.—Potatoes are active at $1@1.50 ₹ bbl. bulk, quality fine. Va. sweet $6@6 50 Tomatoes are scarce. L. I. farmers do not fear damage to the future crop by the late drought. Cucumbers have mostly run out on the Island. Cauliflowers will run light this season; they are very backward on this end of L. I. Cabbage has advanced.

Sweet corn, Jersey ₹ 100 75c@$1; Burlington corn do. 50@75c; Green peas, L. I., ₹ bag. $1@1.25; wax beans L. I, do. 75@$1; string beans L. I. do. 50@75c. cucumbers, L. I. ₹ 100 $1; egg plant Phila ₹ bbl. $5@6.50; Tomatoes Phila ₹ basket, 80c@$1; L. I. ₹ bu. $1.50@1,75; Md. prime do. $1 50@2; Norfolk ₹ crate 25c@$1; squash marrow ₹ bbl. 75@$1; L. I white 75c; do. yellow, $1; cabbages, Flat Dutch ₹ 100 $5@7. beets, L. I. ₹ 100, bchs $1@1.50; onions, potato prime ₹ bbl. $1.25@1 50; fair to good $3.50@4; lettuce 75@1.25; carrots ₹ 100 bchs $1@1.25 white turnips, Jersey, $2 50@3.00; turnips Russia ₹ bbl. 50@75c; cauliflower, J'y & L. I. ₹ bbl. 12@5; okra ₹ 100 15@20c.

WOOL.—Market dull and weak at about last week's prices. Buyers for the moment seem well supplied, having made frequent purchases before prices ran up to present points.

LIVE STOCK MARKETS.

NEW YORK, Saturday July 30, 1881.

BEEVES.—Receipts for the week 12,456 head; do last week 14,481 do. A surplus of stock on hand forces sellers to make concessions in order to effect a clearance. Good and prime native steers sold at about previous prices, but the common and medium grades were fully ½c lower. Fair Texans sold at 8c. to dress 55 lb.; the bulk of the sales was from 9½ to 11¾c. to dress 56@57 lb, and included ordinary to strictly prime.

SHEEP AND LAMBS.—Receipts for the week 23,526 head; do. last week 38,650 do. A few prime sheep and lambs sold at fair prices, but all other grades were in buyers' favor. Sellers look for some turn of improvement. Sheep ranged 3¾@5½c.; Southern and Western lambs 4½@6c.; State and Pa. 5½@7½c.; very choice Del. Co. 7¾c.

SWINE.—Receipts for the week 12,917 head; do. last week 35,025 do. No hogs on sale at the yards, receipts went to packers. Live nominally firm at $6 90@7.10 ₹ 100 lbs. medium to light N. Y. pork 9@9¾c; city dressed Western 8¾@9c.

COWS AND CALVES.—There is some inquiry for good cows at $60@65 ₹ head; common run down to $40 and the sales mainly range from $40@50.

VEAL CALVES.—Prime light calves have sold well; market easier for all grades with a large supply.

Live N.J. prime to choice, 7½@7¾c; do, State, 7¼@7½c.; poor to good 5@7c.; Mt. Hollys, 6¾@7¾c.; buttermilk, 4@4½c.; up-river dressed 11@12c.

THE OLD RELIABLE HALLADAY
STANDARD WIND MILL
26 YEARS IN USE.

GUARANTEED
Superior to any other make.
17 Sizes-1 to 40 H. Power
Adopted by U.S. gov. at forts and garrisons and by all leading R. R. Cos. of this and other Countries.
Also, the
Celebrated I X L Feed Mill,
which is Cheap, Effective and Durable. Send for Catalogue "B" and Price List. Address,
U. S. Wind Eng. & Pump Co., Batavia, Ill.

IMPROVED CALIFORNIA WIND MILL.

Simple, Strong, Durable, Rosette Wheel and perfectly Self-regulating, avoiding 100 wearing joints. Also, Steven's Pony Feed Grinder and a perfect Rotary Motion attachment, without gearing, the power being communicated by the lift or up stroke of Pump Rod. Can be used for cutting feed, churning, &c. The best, cheapest and most useful power in the market. Full particulars, circulars, &c., sent free. Address the Manufacturers. CLARK & CO., SOMANAUK, ILL.

ENTERPRISE WIND MILL.
Known and sold throughout the world and acknowledged The Best. Simple Durable, Strong. Few Joints. Frictionless Turn Table. Multiplying Ball Governor. All sizes for Rail Road, City and Farm Purposes. Every Mill Warranted.

Enterprise Feed Mills New and startling. For Wind, Horse, Steam or Water Power. Climax Corn and Cotton Cultivators. Pumps, Tanks, &c. Send for *brown* Catalogue
SANDWICH ENTERPRISE CO., Sandwich, Ill.

CHALLENGE WIND MILLS
Victorious at all fairs. Over 7,000 in actual use in every State and Territory of the U. S. It is a section wheel—has been made by the present Co. for ten years; in all that time not one has blown down without tower breaking—a record no other mill can show. We leave it to the public to determine their merits. Mills sent on 30 days' trial. Best Feed Mills, Corn Shellers, &c., &c. Catalogue free.
CHALLENGE MILL CO., Batavia, Ill.

THE
PERKINS WINDMILL
WAS THE FIRST
SOLID-WHEEL WINDMILL

that governed itself successfully. The Best in the Market for the last Ten Years, and has received
More Premiums and Medals
when on exhibition, than all other windmills competing.
For Beauty, Strength, Durability and Power,
IT HAS NO EQUAL,
as any one will see by examining and comparing with other windmills.

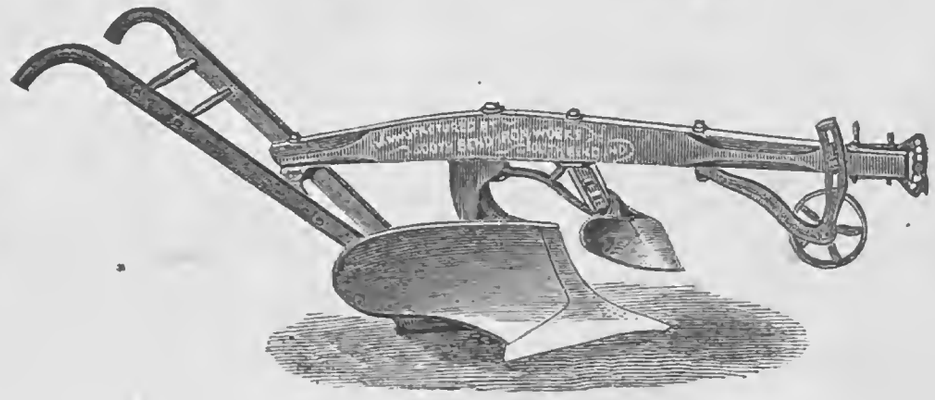
THE PLOW OF THE PERIOD.

THE "OLIVER CHILLED."



Ten years ago almost unknown—to-day doing service on over

HALF A MILLION FARMS.

Sales steadily increasing, and showing the largest ratio of gain where it is best known.

Endorsed by the best agricultural authorities in the country—and its superior merits confessed by a brood of puny imitations.

With 700 men, nearly a million dollars of capital, and acres of buildings and machinery, employed in its production—the demand for this—

THE LEADING PLOW OF THE AGE,

has been during the past year beyond our capacity—a state of facts never before witnessed in the

ANNALS OF THE PLOW TRADE.

☞ Beware of imitations, and see that the name "Oliver" is on the beam.

THE
"CASADY" SULKY PLOW.

A revolution in the art of plow-making. Has no Landside! Carries every pound of side and bottom pressure on its wheels! Guages the width of its own furrow! Turns square corners without lifting out! Rides over buried stones without disturbing the truck! Works in the hardest, dryest ground! and accomplishes other results not possible to any other plow on wheels.

Address for Circulars, Terms, etc.

Reading for the Young.

FARMING FOR BOYS AND GIRLS—NO. 30.

HENRY STEWART.

What is Manure?

In looking over the tables given in the last article we may note some interesting facts, which go to show in a very clear manner to what purposes the food consumed by animals is applied. The figures given relate to full-grown animals, in which the bone and muscles have been formed, and only the wastes of the body and the support of life have to be provided for. A young animal is daily adding to its size and weight, and of course a large part of its food is used up in supplying the substances of its body—the bone, flesh, skin and hair and another part goes to support the vital action and the heat of the animal. But in a full-grown animal it is different. There is no bone to be formed and no flesh, only the wastes caused by the action of the muscles in work in the horse or ox and the product of milk in the cow. We see on looking over the tables that the cow which yields a large quantity of milk consumes more of the food than any other animal mentioned, and leaves less in the waste discharged, or, in other words, in the manure. To make this more plain the precise figures are put in the following table:

Of 100 lbs. of	Amount of food used up by the Cow. lbs.	Ox. lbs.	Sheep. lbs.	Horse. lbs.
Dry substance	53	48½	46½	54½
Organic matter	57½	53	50½	59½
Nitrogen	36½	10½	4½	16½
Mineral matter	3	..	..	..

The above figures are very interesting. They show how truly the results of scientific inquiries are supported by the plainest facts, and prove how very much the results that are reached by the labors of men of science deserve our confidence. For instance, we know that the cow gives us a large quantity of milk, which is the most nutritive food in existence, because it is of itself sufficient to support life and enable a young animal to thrive and grow. Milk, in fact, contains all the elements of every variety of food. Its production must therefore be a great tax on the cow, and should require a large quantity of food. And so we see that the cow uses up, that is, digests and turns into blood (from which the milk is formed), 57½ pounds out of every 100 of the whole organic matter of the food, which is chiefly carbonaceous and goes to support the vital heat, and to make fat and butter; while the horse, which plows and draws heavy loads, and works as hard as he can be forced to, uses up only 1½ more, and the working ox even less; while the sheep, which lies around and eats, and makes only wool and fat, uses up but 50½ pounds out of every 100. But the next line shows this fact even more plainly; for the cow, of whose milk we make cheese, which is very rich in nitrogen, takes 36½ pounds of nitrogen out of every 100 pounds in the food; while the horse, which works hard and needs the nitrogen to replace the waste of muscle, takes only 16½ pounds; the working ox takes but 10½ pounds, and the lazy, idle sheep uses only 4½ pounds, and of this the most goes into the wool.

When we think of these things which are shown by persons working with scales and weights and chemical substances, in rooms furnished with what we call chemical apparatus, and of how a quantity of hay, corn-meal, bran, straw and other food can be examined, and of how the animals themselves can be weighed and watched and observed several times a day, and how the results of all these studies can be made so clear, and put into figures so plain, that we can easily understand all about it, and know of our own knowledge that they are reasonable and agree with what we can perceive ourselves if we only try to, we may well wonder at the capacity of the human mind and get some little insight and glimpse into the ways and methods by which men of science find out and discover things, and the practical uses to us of their studies and discoveries.

One more view should be taken of this subject. It is plain that if we take a certain quantity of grass, corn, wheat or oats from our land, or buy a certain quantity of food, and feed it to the cows, or horses, or sheep, that the most of it will be used by the cows and the least by the sheep. It follows, then, that the least of the food will be returned in the manure by the cows and the most by the sheep. And so we find it in fact, although we may not have known the reason for it, that cow manure is the least rich; that horse manure is better than cows' manure, and that the manure from sheep is the richest of all.

Then if a farmer has a desire to feed some animals in the Winter for the sake of making manure for his farm, he should get a flock of sheep; and if he has some hay and feed from which he desires to make the most money by feeding them, he should keep cows, because these will return the greatest part of them in a condition in which they may be sold and turned into money. But, as we cannot have a thing and sell it too, what is left of the food in the manure from the cows will be of much less value than that left by the sheep.

RURAL LIFE.

UNCLE MARK.

"Give fools their gold and knaves their power,
Let fortune's bubbles rise and fall;
Who sows a field, or trains a flower,
Or plants a tree, is more than all."

Our first thought of rural life in Summer is that of pure air, cooling breezes, green earth and with it we associate thoughts of peace, contentment and happiness. But yet, with all these delightsome things there are others, as in all business or professions, which are quite the opposite, and with which every farmer's boy or girl is familiar. But for the farmer's children there is a happiness or a pursuit of happiness to which city boys and girls are strangers.

The expression "pursuit of happiness" conveys to the mind the idea that happiness is to be sought after and if we would *have* it we must *pursue* it. Happiness in rural life or anywhere else, comes not to the idle; it is the wide awake and active who enjoy most, and it is well that to her leafy bowers there are many paths though, perhaps, they are not always pleasant ones. I presume my young friends often feel that they would like to leave the farm and come to the great, busy city, here hoping to find happiness and, in time, wealth. Some come, perhaps, but a few weeks or months of city life weary them of their choice and they long to return to green fields and fragrant flowers. Such can fully appreciate the true happiness of rural life, and such only. The children who have never seen the beauty of the country in Summer time or who catch but faint glimpses of it in a brief Summer vacation, know little of rural happiness.

But some one will say, perhaps, "I want to be rich. Father has always been a farmer and he isn't rich. I am going to the city." Are you quite sure your father isn't rich? He may not have many government bonds nor much money in the bank, but he has his farm paid for; he has money enough to purchase the necessities, perhaps some of the luxuries, of life: he can give his children an education; he has health and a beautiful home. Is not this riches? There are various kinds of riches, and much of our happiness depends on which we choose!

One day a gentleman congratulated William B. Astor on his great possessions and the happiness he must enjoy on account of them. Said Mr. Astor, "I come to my office at nine o'clock in the morning and find a small army of mechanics of all kinds awaiting my orders or seeking employment. Then come my collectors with rent-rolls and complaints about tenants unwilling or unable to pay. After some hours all these are dismissed. I devote perhaps twenty minutes to lunch, then correspondence, bank accounts and other business matters take up my time until five o'clock and I go home tired out."

Mr. Astor asked "How would you like to do all this for your board and clothing? That's all I get!" This was approximately true, since the great wealth of the Astors' was accumulated in the fur trade and was greatly increased by real estate investments.

Happiness dwells sometimes in marble hall and gilded palace, but oftener in the unpretentious home of the farmer or in the rude hut of the pioneer. Contentment is the secret of it all, and this makes "man king, woman queen and their darlings, princes and princesses in the rural kingdom." The farmer's boy who loves his work is not the one who looks with longing eyes toward the town or city, but he it is who lives content in the prospect of having some day an interest in "father's farm," and this, if nothing more, is an incentive to labor. It *may* be that these lines will be perused by some who are inclined to be discontented on the farm, and there may be reason for it, but unless there is choose certainty rather than uncertainty; a fair competence rather than insecure millions, and in the end you shall realize the truth so beautifully expressed in the stanza above from Whittier.

The weakest woman, smallest child and sickest invalid can use hop bitters with safety and great good.—*Adv.*

ENIGMA.

I am composed of five letters;
My 1st is in well, but not in brook.
My 2nd is in stare, but not in look.
My 3rd is in plant, but not in flowers.
My 4th is in time, but not in hours.
My 5th is in rain, but not in snow.
My whole is something you very well know.

☞Answer in two weeks. G. G. S.

PUZZLER ANSWERS—July 23.

GEOGRAPHY PUZZLE.—I was awakened one morning by a Shanghai which was perched on a fence near my window. From an adjoining room I heard a Wale, and I called a Negro to make a fire, as I felt Chili. On going down stairs I found that a Slave had spilled Greece on my highly-prized Brussels while putting on the table my breakfast, consisting of a Turkey seasoned with Cayenne, also a Cod, and Sandwich, Bordeaux stopped with a Cork, and basket containing Oranges and other fruit. I paid a Guinea for my breakfast and then asked a Cook for some sugar to feed a Canary that was hanging in my chamber.

ACROSTICAL ENIGMA.—Maud E. Meredith.

Miscellaneous.

THE LIVER.

The Unusual Attention which this Organ is now Attracting from the American People.

Its Delicate Structure and Susceptibility to Injury from Wounds or Disease.

In the opinion of the ancients the liver was the seat of the affections and of the passions. Modern research, however, has shown this to be an error, and hence less attention and care have been bestowed on this organ than in the early days when it was supposed to play so important a part in making war and cajoling love. Undoubtedly the discovery of the fact that the liver is not the seat of the affections, and of the passions, has led the people, as is natural, to neglect what formerly was an object of great solicitude, but the truth still remains that though it may not be the special seat of love and passion, it is after all of the greatest importance in physical health.

During the past few weeks, owing to an event of national interest, much has been said and written about the injurious effects of wounds in this organ, and according to the Surgical History of the War of the Rebellion, of the thousands of cases of wounds in the liver, not above sixty survived, and they were not violent ones. The record is filled with recoveries from gunshot wounds in the head, the lungs and the pelvic region, but it is a "miracle" when one outlives even an ordinary wound in the liver. No other proof is needed of the delicacy of its structure, nor of its extreme susceptibility to injuries, whether violent, like a gunshot wound, or as the result of disease. Of course injury from a wound produces speedy results, and though organic diseases may affect the patient for years, and render his life a long continued burden, the same end is eventually reached.

The structure of the liver is delicate and yet simple. It is composed of two lobes, which lie directly under the right lung, and is of a spongy character. When the venous blood is circulating from the various parts of the body to the lungs it passes through this organ, and is there relieved of its rank poisons, part of which are used for digestion and part for a cathartic of the waste materials of the food we eat. If the organ is at all diseased *these poisons remain in it*, instead of being used as nature designed, and with every coursing of the blood through the lobes of the liver, the nature of the disease is intensified, and hence a neglect of any disorder in this organ is almost certain to bring on chronic liver disease, so terrible to contemplate. In curing liver troubles not only must the organ be rid of its old complaint, but, at the same time, it must be prevented from contracting other diseases, and the agency used must have such power with the kidneys and lungs (the other two purifiers of the blood) that it will, while restoring the impaired liver, give to them strength sufficient to do part of the purifying work of the disabled organ. There is a peculiar dependency between the kidneys and liver, and no remedy can be of benefit which does not act upon both at the same time. The reason why so little success has hitherto been reached in the treatment of liver disease is because the philosophy of treatment has been lame and the remedies employed have been inadequate. It is a conceded fact that until within the past few years there has been no known remedy for chronic kidney diseases, and it is certain that the liver cannot be restored to its right action if the kidneys are affected. It is a fact that when the liver is diseased the kidneys are also troubled; hence, it follows that liver diseases are hard to cure chiefly because the doctors know of no agency which will at one and the same time operate on both the kidneys and the liver.

Admitting then that no form of treatment can be effective which cannot restore both the liver and the kidneys at the same time, it would be strange indeed if in all the researches of this wonderful age of scientific invention no such remedy had been found. The doctors admit they have nothing to offer, but independent scientists have honored their learning and patience by discovering a pure vegetable remedy whose success in the past few years in the treatment of kidney difficulties shows conclusively that it can cure every form of known kidney disease, and what it has done for the kidneys it is equally able to do and does for the liver. Warner's Safe Kidney and Liver Cure was the discovery of a practitioner, who proved its worth in his own case and then gave it to the world. It acts both as a food and a restorer on the kidneys and liver, so that when disease is cured in one of these organs it cannot go to the other, but is entirely removed from the system.

The symptoms of kidney and liver difficulties are great and unnatural weariness, headache, belching of wind and food from the stomach, constipation, piles, displacements and inflammation of the sexual organs of women, a sallow countenance, skin eruptions, and the especially fatal complaints of the hot season. These troubles are caused principally by malaria, which is, at the present time, becoming so great an evil in this land—so much so that President Paul A. Chadbourne, of Williams College, has just published a long and interesting article on its wide-spreading prevalence. He states that malarial poisons appear in all localities, the high and dry, the low and damp, in the crowded city and the roomy country, and there are no differences as to the effects produced. Malaria is in the water we drink, in the air we breathe, in the food we eat, and while constantly and naturally increasing with the growth of the country, it is just at present afflicting us, as the epizooty did a few years ago as a widespread and dangerous epidemic. Prof. Chadbourne is not an alarmist and what he says is confirmed by other distinguished medical authorities.

What, therefore, can be the cause for this terrible increase of malaria in all parts of the states and territories? Unquestionably the drinking water used in every portion of the land is the most active agency for carrying malaria into the system. This water may be clear, but it has become poisoned by filtration through the vaults, cesspools and barnyards in the country, and other impure agencies in the city. Heretofore the Western states and territories and almost the entire South have been considered the field of malaria, owing doubtless to the poor drainage in many localities and the consequent accumulation of green poisonous matter. This theory is, however, now exploded because malarial poisoning is becoming just as common in other regions, and those which have been settled for hundreds of years. Nor are low lands alone subject to malaria, for it is found in the Berkshire Hills of New England and up among the snows of the Rocky Mountains.

Whatever may be the cause of malaria, its existence is a terribly established fact, and so much so that it is attracting the attention of the leading physians, scientists and scholars in every portion of America. By means of its blighting powers the blood becomes poisoned and the most terrible diseases follow. The special field for the operation of this poison is in the liver. If this organ is at all diseased, malaria seizes it with a death grip. It is therefore absolutely necessary to keep the liver in perfect condition and especially at this time. The elements of Warner's Safe Kidney and Liver Cure are exactly fitted for just this very purpose. Composed of a pure and simple vegetable extract and prepared in the most careful manner it has been the means of restoring more people to health within the past year than any other agency known in the land. Prof. S. A. Lattimore, Ph., D., LL. D., one of the analysts of foods and medicines for the New York State Board of Health, pronounces its elements and composition purely vegetable, neither poisonous nor injurious, and the manufacturers present it to the public with the utmost faith that if taken faithfully and persistently, according to the directions, it will cure every form of liver disease and kidney disorder.

There seems to be a constant struggle between mankind and disease. Malarial poison, with its insidious power, the influence of heat, cold, bad water and impure food all combine to undermine the health and strength, both of which are the privilege of the race. In order to counteract these terrible influences, the greatest care is required, especially at the present time in guarding the kidneys and liver, which are the governors of the system. How this can best be done has been outlined above, and as such it is cordially recommended to all as the most efficient means for securing the best of health and continued happiness.

New York State Fair.

The 41st Annual Cattle Show and Fair of the New York State Agricultural Society will be held at

ELMIRA,
Sept. 12th to 17th, 1881.

Entries Close Saturday, August 13th,

Examinations for entrance, Sept. 14th. Catalogues sent on application. W. L. DEAN, Registrar.

PERSONAL ITEMS.

Bismarck habitually reads a chapter of the New Testament at bedtime.

Ex-President Filmore's widow has been giving money to a Havana, N. Y., academy.

James Gordon Bennett is among the foreign notables now paying a brief visit to this country.

In the Senate there are now two Millers, two Joneses, two Hills, two Davises and two Camerons.

The heirs of the San Francisco millionaire, Mark Hopkins, claim that $11,000,000 of the estate are still undivided.

The President's sick-room is constantly fragrant with fresh flowers arranged by his wife. Every morning the White House conservatory is visited for his benefit.

Edw. Richardson is probably the most wealthy cotton planter in the world. The New Orleans Picayune estimates that he is worth $8,000,000.

Senator George is said to be esteemed the greatest lawyer in Mississippi. He has a sledge-hammer way of doing things and suggests the Western man rather than the Southerner.

Governor Roberts, of Texas, is getting it hot and heavy from church people of that State because he refused to name a day for thanksgiving for the President's expected recovery.

The Chicago Inter-Ocean has learned that Jay Gould proposes to connect Chicago and the City of Mexico by a direct line of steel, running through cars.

New Orleans has about a half-dozen millionaires. E. J. Gay, planter and sugar refiner, is put down at three millions, and D. H. Holmes, Leon Godchaux, E. J. Hart and R. T. Buckner at between one and two millions.

Senator Sherman's library at Mansfield, Ohio, is a large, square, uncarpeted room at the top of the house. It has deep windows, and is full of choice books. His Mansfield neighbors are said to greatly like the Senator, who is thoughtful of their feelings.

John Russell Young tells Gath that General Grant's income is about $50,000 a year from his son's firm in which Grant is a silent partner, from his railroad positions, his own investments and the Grant fund.

The Czar has commuted the death sentence of Hessy Helfmann, the pregnant woman, convicted of complicity in the assassination of the late Czar, to penal servitude for life.

David Davis, of Illinois, announces his purpose to retire from public life at the end of his Senatorial term. He will live at Bloomingdale and attend to private business.

Rosa Bonheur is 58 years old. Not infrequently she has been paid for her work at the rate of $500 a day. Her first picture was received at the Paris Salon when she was but 19 years old.

[Philadelphia Times]

Philadelphia Police Department.

The Philadelphia Ledger of Dec. 29, 1880, mentions among many others, the case of Chief of Police of that city, Samuel H. Given, Esq., who says he used St. Jacobs Oil in his family, for various painful ailments, with excellent results. He has also heard from many who have used it for rheumatism, that it alone of all remedies did them good.

Humorous.

There was a young fellow named Sam,
Most exceedingly fond of raw ham,
Till he got trichinosis,
In four or five doses—
And they buried him close by his Mam.
—Steubenville Herald.

EXCITED AND ANXIOUS PATIENT.

"Doctor, I do wish you'd tell me what's the matter with me; I'm clear out of sorts this morning, and I'm afraid I'm going to be down sick. What is the matter with me?" Doctor (gravely:) "Let me see your tongue." Patient thrusts it out. "What have you been eating?" Patient (reflectively:) "Well, I was out late last night, had a bit of supper at midnight, oysters raw and stewed, lobster salad, cold tongue, pressed chicken, curds and cream, coffee, some fruit cake, a little cheese, and a handful of hickory nuts." Doctor (doubtfully:) "Let me see your tongue again." Looks thoughtfully at it, then, in authoritative tones, "Ah, yes, I see; you've been eating something that doesn't agree with you." Grateful patient gives him two dollars.

The obituarian of the Philadelphia Ledger (if it was indeed he) outdid himself in the ingenuity of his rhyme, in the following effusion:

Our little Sallie to heaven did go;
Baby life so sweet is;
She was affected with the cerebro-
Spinal meningitis.

'Tis hard to lose our Sallie so,
But the reflection sweet is
That she has gone where there's no cerebro-
Spinal meningitis.

The bride who sings, "Do they miss me at home?" is unreasonable. They speak of her as Mrs. now.

HONESTY THE BEST POLICY.

Recently a lady stepped into a bird shop to purchase a parrot for a household pet. Having examined the collection, she turned to the proprietor, and without otherwise designating her selection, simply said, "I will take Honesty." "Beg your pardon, ma'am said the dealer. "Which one is it you said you will take?" "I will take Honesty." "Honesty," repeated the puzzled dealer; and which one is Honesty?" "Why, that one, of course," said the self possessed customer, pointing to by far the fairest bird of the flock. "All right, ma'am," said the ornithological trader. And as he was making the necessary change he timidly ventured to ask, "And may I inquire, ma'am, why you call it Honesty?" "Certainly," answered the customer, with a heavenly smile. "That parrot is Honesty because Honesty is the best Poli I see," The dealer was struck with a congestive chill, and gave the lady a half-crown short of her change.

CORTEOUS, kind-hearted editors never—well hardly ever—object to contributors writing on both sides of the paper, articles for the waste paper basket.

YOUNG LADY—"I have called Mrs. Brown, to ask you why your children do not attend the Sunday-school now, as they used. Do they not like going?" Mrs. Brown—"Oh, yes. miss, they like goin' well 'nough; it's the stayin' after they gits there as they don't like."

WE cannot agree with some folks, who believe the world is "growing wickeder every day." It is easier to get trusted now than it was three months ago. Tais shows that the beautiful idea of man's faith in his fellow man is gaining ground.—New Haven Register.

A HUSBAND who lately went to execute a few little commissions for his wife gives it as his experience that there are two dozen different brands of lilac sewing-silk so exactly alike that no male eye can tell the difference, and a wrong choice means ruin to a new silk dress, and no pie in the house for a week.—Commercial.

Two Cincinnati ladies, who had lately returned from a trip abroad, were exchanging opinions with reference to the famous pictures they had seen. "Give me the reconaisance school of art," exclaimed one, "so full of sympathy, of poetry; so different from the pre-Rachelite." "It is very true what you say," observed the other; "but as for me, I just dote on the Dustledrop school; the paint is so much fresher."—South and West.

[Quincy, (Ill.) Daily Herald.]

Speaking "By the Card."

C. H. Wood, Esq., of the C. & T. Ry., Port Huron, Mich., favors our correspondent with the following: After suffering for nearly a year with rheumatism, receiving treatment from most of the best physicians of Michigan and the West, I happened to try a bottle of St. Jacobs Oil. Upon the first application I used fully half a bottle, and its effect was almost instantaneous. I immediately dropped all other treatment, and confined myself to its use alone. After the use of three bottles, instead of being driven to my business, or moving about on crutches, I walked from one to three miles daily about business, and have been free from this horrible disease for over a year, not having the slightest twinge of it. Hence, I say that all medicines known to me are useless when compared with the Old German Remedy. Use this statement when and where it suits.

FALLING INTO FAST COMPANY.
A Hare's-breadth Escape.

THE NEW SHEEP DIP.
Little's Chemical Fluid.
(*Patented in U. S. July* 3, 1877.)

CHEAPEST AND BEST FERTILIZER---FOLLOW NATURE.
Which USES GROUND RAW LIMESTONE in MAKING THE SOIL. There were no Lime Kilns around burning lime when the good **Limestone Farming lands** were originally made. Every Farmer can prepare his own Fertilizer with an **ordinary Horse Power** by using **FORSTER'S COMBINED CRUSHER & PULVERIZER,** which takes a lump of Limestone three to five inches square, and Crushes and Pulverizes it in **one operation,** same as Burr's. Farmers use the Ground Raw Limestone, and drill and sow it just as it comes from the machine. W. W. Reed, of Erie, has tried it 6 years, and says it shows a profit over Bone Dust of $1.96 per acre; over Phosphate of $4.28 per acre; over Guano of $9 70 per acre; over Salt of $5.20 per acre, **and that it will last twice as long."**—John G. Bear, of Montgomery, Lycoming Co., says: "I believe it to be the cheapest and best Fertilizer in this country. *It is worth three times as much as Burnt Lime, and with this machine does not cost half as much as Burnt Lime to make.*"—H. C. Falls, New Castle, Pa., says: "I used the Ground Limestone last year with great satisfaction as to results, and cannot too strongly recommend it for farm and garden purposes Where I dropped my corn on top of it, the corn came up first, and was strong and thrifty—the Limestone drawing the moisture to the roots. Used in place of Paris-green on Potatoes, it kept the Bugs away and made the plants thrifty and strong: being washed into the ground, it benefited the Potatoes in an astonishing manner. Addre only TOTTEN & CO., Pittsburgh, Pa. ONLY MAKERS.

It is manifest that from GOOD SEEDS ONLY can Good Vegetables be obtained.

COLUMBIA BICYCLE.

Bicycle riding is an accomplishment easily acquired, and is rapidly becoming the most popular of out-door sports; as a health restorative it is invaluable, bringing into action every muscle of the body, strengthening the lungs, and invigorating the wearied brain. The practicability of the machine is generally conceded throughout the country, and the thousands of bicycles in daily use are constantly increasing in number. Send 3c. stamp for catalogue, with price list and full information. THE POPE M'F'G CO.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Ralph Evans

VOL. XL.—No. 1646.} NEW YORK, AUG. 13, 1881. {PRICE FIVE CENTS $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Biographical.

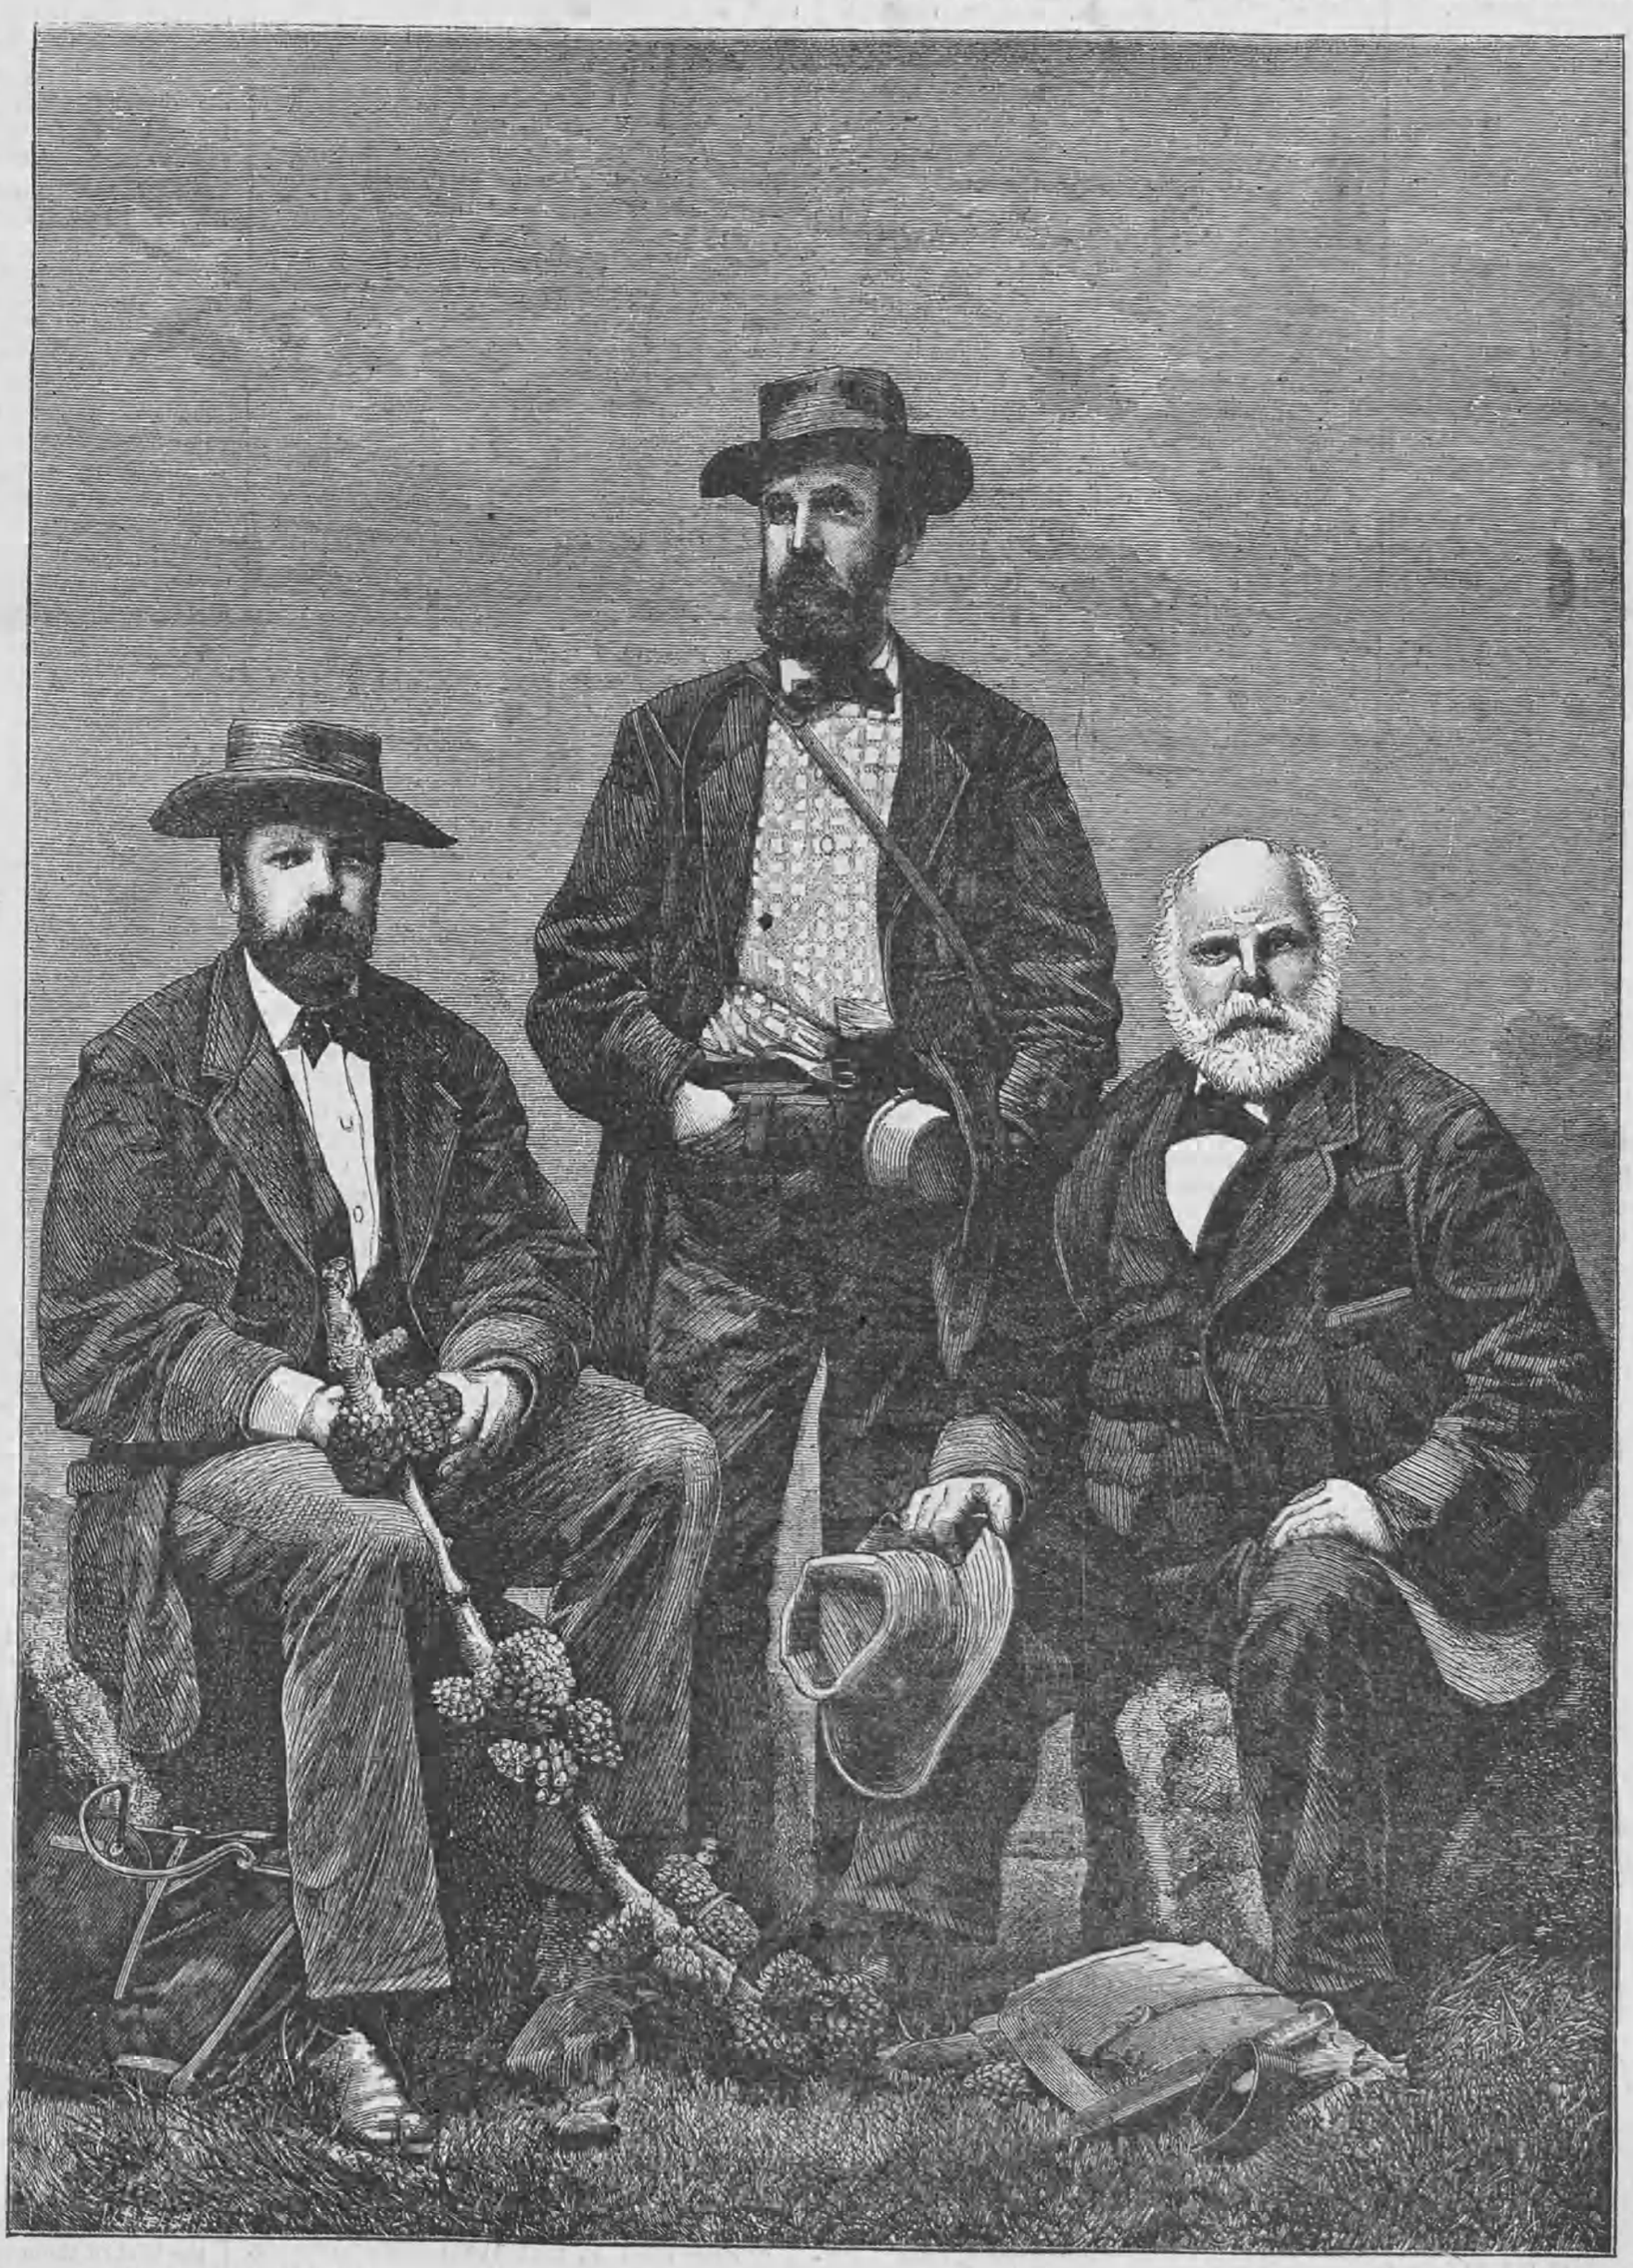
EXPLORERS OF PACIFIC SLOPE FORESTS.

As one of the special investigations undertaken by the United States Government in connection with the tenth census of the United States, a thorough study into the forest area and forest wealth of the country, and of the economic importance of the American forests in relation to agriculture, commerce, the railroads, etc., was determined on. Professor Sargent, Director of the Arboretum of Harvard College, was placed at the head of this Department. He organized his investigation by dividing the country into several sections, placing at the head of each a competent observer whose duty it was to examine and report on the extent and nature of forests in his section, the development of the lumbering industry, and the other industries dependent on the forest. The forests of the Pacific Coast being least known, both in their economic importance and the distribution and specific characters of the trees comprising them, Professor Sargent reserved this for his individual investigation. Accompanied by Mr. Robert Douglas, of Illinois, the well-known grower of trees, and Mr. Skinner, his private secretary, he left Boston in June, 1880, passed some time in Eastern Kansas studying the western limit of the Atlantic forest, and then devoted some weeks to a hurried examination of the forest of Central Colorado. Then the Professor and Mr. Skinner went by rail to California, being joined en route by their associates, Dr. George Engelmann, the distinguished botanist of St. Louis, and Dr. C. C. Parry, who for more than thirty years has explored the botany of Western, and especially Southwestern, North America. From San Francisco the party went by sea to Portland, Oregon, and then through Puget's Sound to Vancouver's Island, and up the Fraser River in British Columbia to above Yale. In descending the river they ascended a high peak south of it near the town of Hope, a Hudson's Bay station. Here much was learned in regard to the northern distribution of the coniferous species of the Pacific forests, and there the party was fortunate enough to re-discover the Abies amabilis, a species discovered by Douglas more than 50 years before in Oregon, and about which great confusion and doubt have always existed in the minds of botanists. The re-discovery of this truly magnificent species, the most beautiful representative of the genus in North America, and the determination of its range and specific character may be considered, perhaps, among the most important of the scientific results of the expedition. The party then returned to Portland, stopping at various points to study the forests in their different aspects.

They then, Dr. Parry having left them to explore the botany of Mt. Adams, ascended the Columbia River to the Dalles on the eastern edge of the Pacific Coast forest, and in returning Prof. Sargent made the ascent of the high mountains south of the Cascades of the Columbia River and succeeded in reaching the very spot where, 50 years earlier, Douglas discovered his Abies amabilis and Abies nobilis, a spot which no botanist since Douglas had visited until August 4, 1880, when Professor Sargent made the ascent.

From Portland the party went overland to Southwestern Oregon and explored the magnificent forests of Lawson's Cypress which abounds in the neighborhood of Coos Bay and Port Orford. Then crossing the Coast Range, they proceeded south to the Mt. Shasta region in Northern California, where several weeks were passed in exploring the forests of Northern California. Thence they returned to San Francisco and then went south to the forest of the "Great Trees" (Sequoia) in Tulare County, and then to Los Angeles and to the San Bernardino Mountains. Then by rail eastward through Arizona to Tucson, the then eastern terminus of the railroad. From this point they went south by wagons to near the Mexican boundary into the high Santa Rita Mountains, where many interesting discoveries were made and many trees peculiar to the Mexican flora were collected. From this point the party returned to San Francisco, and then after a short stay in the Sierras near the crossing of the railroad, Professor Sargent returned home, after an absence of over four months, during which nearly 15,000 miles had been traversed.

The expedition was thoroughly successful, and resulted in the most comprehensive and thorough survey of the Pacific forest which has ever been made, and which extended from far north of the British boundary to the Mexican boundary in the south. A vast amount of information was collected in regard to the distribution of species, their specific character and economic



PROFESSOR SARGENT. MR. SKINNER DR. ENGELMANN.

EXPLORERS OF THE PACIFIC SLOPE FORESTS.—Fig. 891.

importance, adding besides several new species to the sylva of the United States. Wood specimens of every tree of the Pacific from the northern to the southern boundary were procured, often only with great labor and difficulty, and sent home, to furnish material for a series of experiments undertaken by Professor Sargent, for the purpose of determining the exact value of all North American woods as fuel and for various purposes of construction. The result of the tests, and the scientific and economic results obtained in the course of this expedition by Professor Sargent's numerous assistants in various parts of the country, will appear in his final report, now in course of preparation.

In 1872 Professor Sargent succeeded Dr. Asa Gray as Director of the Botanic Garden at Harvard College. In 1874 he visited the important botanic gardens and institutions of a kindred nature in Europe, and on his return to America with the view of remodeling that under his own charge, he made a general clearance of all movable shrubs and herbaceous plants to a reserve garden and cut down the many duplicate trees. The garden was then re-surveyed, and laid out afresh according to a definite and convenient plan, the plants being disposed as far as practicable in the sequence of genera given in Bentham and Hooker's GENERA PLANTARUM. In 1876 he secured the able assistance of Mr. William Falconer under whose superintendence all these changes and plans were executed. When Prof. Sargent assumed control of the garden in 1872 it contained 2,400 species of plants, and when he resigned its charge in 1879 5,901 species were represented in it.

In 1872 he was likewise appointed Director of the Arnold Arboretum of Harvard College. The Arboretum contains 125 acres of woodland near Forest Hills Station a few miles from the center of Boston. It is intended to convert the Arboretum into a beautiful park and include it in the general park system of Boston, and with this end in view a plan of it has recently been prepared by Mr. Fred Law Olmsted the eminent landscape gardener of New York. It is intended that it shall contain every tree, shrub and herbaceous plant, native or exotic, that will be found hardy there, and from the great variety of soils and situations upland and lowland, rock and pond, contained in it, we may expect soon to find therein represented such an extensive collection of hardy plants—trees, shrubs and herbs, as are nowhere else represented on an equal given space on this continent. Propagating houses and nursery grounds are contiguous, and thousands of plants are ready for planting. This is supplemented by a herbarium and museum, illustrative of trees, their products and uses, and which is now temporarily contained in the Dwight House—a spacious residence-building on Mr. Sargent's private estate at Brookline, and which is entirely given up to this use.

In addition to his directorship of the Arboretum, in 1879 he was appointed Professor of Arboriculture. Prof. Sargent is a strong man—a man of talent, perseverance and will, progressive, and with a passionate fondness for the branch of science he has assumed.

Horticultural.

RAYS.

I DON'T care how pretty the Ox-eye Daisies are, or how much "Horticola" (p. 482) blesses them, they are vile weeds at the best, a curse upon our land, and it is our duty, man and child, to root out what is bad. The Ox-eye Daisy is not fit for winter-forcing, the Paris Daisy is. My neighbors have got to calling the common Rudbeckia (Cone-flower) that grows in our hay fields by the name of "Yellow Ox-eye Daisy." Now if the American system of naming plants—which is, giving precedence to priority—is to be adhered to, my neighbors are wrong. The Yellow Ox-Eye Daisy, or Corn Marigold, as it is likewise often called, is a European plant, next of kin to the White Ox-eye Daisy, and, too, as villainous a weed.

* *

AND then comes Professor Budd with a good word for Bocconia Japonica! Yes, Professor, it may be handsome and the bees may love it, but once it gets a foothold it intends to stay there. The roots reach down into the subsoil, stretch out beyond the parent-stool, and every broken piece will grow. In this way it resembles the giant Knotweeds, also handsome plants, but, alas! a miserable nuisance, too.

* *

"CLINTON" you tell us "Plant Trees;" now please tell us what trees to plant and where to plant them. We don't care whether they are native or foreign trees, we wish something cheap, quick-growing and suited to our wants. Don't lump them and call them pines or oaks, but tell us what kind of pines, what kind of oaks. Robert Douglas, in Illinois, grows forest trees by the million; that is the sort of stuff we want.—White Ashes, European Larches and the like, but we do not wish to incur the danger of planting bog trees on hill tops or those that only thrive in gravelly land upon our hog-wallow prairies. And when it comes to timber trees, we don't want beeches, balsam firs or poplars, but something of sterling value. Please help us, "Clinton."

* *

IN addition to what is said in a late issue about raising clematises from seed, let me add: On the 14th of February last, I sowed a pan of mixed clematis seed and kept it in the greenhouse; a few plants appeared in May and to-day, July 20, I have potted off from the same pan over two dozen plants about two inches high. There are lots more of smaller ones—some just bursting the seeds, others peeping above ground, etc. Last Fall a neighbor of mine sowed seeds of the Scarlet Clematis in a pan and put a slate over it. It was wintered in a cold-frame and no notice taken of it till last May, when the shoots began to creep out from under the slate.

* *

G. S. H., AUSTIN, Texas, asks, p. 487, about ornamental hedge plants for that part of the country. As so many shrubs are applicable for the purpose, it is more a question of expense, choice and care to be given, than of the sorts that would answer. All shrubs cost money and the finer they are the more costly they are. Among deciduous shrubs the Bridal-wreath Spiræa is exceedingly handsome; crape myrtles, chaste shrubs, double deutzias, althæas, mock-oranges, are all applicable. Of sub-evergreens, that is, plants that are evergreen far South but deciduous further North, are Yanpon, Japan Quince, pomegranate, privets, and white and red-berried pyracanthas. Of true evergreens there are many, for instance, Japanese euonymus, oleanders, Chinese and Golden Arbor-vitæs (the American Arbor-vitæ is useless in Texas), and the like. The tea plant grows well in Texas and would make a pretty garden hedge, and what can be better for the same end than the green or variegated Pittosporum Tobira? [We saw this fine shrub in South Carolina and Georgia last year. It is beautiful as grown alone or in hedges—always beautiful and must sooner or later be highly prized throughout the South.—EDS.] At Whittaker's Nursery, at Houston, Texas, I remember seeing a fine hedge of Cape Jessamine; and then there is the Cherokee Rose. On the Island of Galveston, where shelter from wind is of vast importance, the farmers use oleander, tamarix (they call it Sea Cedar) and Chickasaw Plum hedges. In the case of a garden hedge, please do not use shears in clipping, but, instead, a knife. The shears cut leaves and shoots alike, leave snags, and make no discrimination between weakly and strong growths, contorted or misplaced ones; with the knife you can cut what and how you choose. For fence-hedges the Red-berried Pyracantha is good, but the Osage Orange is the quickest grower and most impenetrable harrier. The alkali soils—poison patches—are detrimental to the pyracantha as well as to many other trees and shrubs, and the "cut-leaf" ants love its foliage dearly.

* *

LAST Fall I lifted and potted a lot of Mourning Bride (Scabiosa) and wintered them in a cool greenhouse. They bloomed a little all Winter long, but not enough to compensate for their room and care. In the Spring I cut them back and planted them out in the garden; they are not growing as rankly as this year's seedlings, but they are blooming extravagantly. The same rule holds good with pelargoniums, fuchsias and other plants,—old plants bloom more copiously than young ones.

* *

WE can prolong the blooming period of many of our plants by cutting off the flower stems as soon as the blooms have past; in fact, the more we cut the blooms off heliotropes and ageratums the more they will branch out and bear a further supply. So will verbenas, Evening Primroses, red valerians, snapdragons, and the like.

* *

EVERYBODY knows the Century Plant; it is Agave Americana. There are a great many varieties of it, and as many other species probably as much entitled to the name "Century Plant" as it is. The notion that the Century Plant blooms once in a hundred years is all nonsense; so is the idea that it dies when it blooms. The grosser you feed it and the thriftier it grows, the less likelihood there is of its blooming; on the other hand, starvation may cause it to bloom. When at maturity it is very large, often too big for our hospitality, hence we seldom have plants big enough to flower. But in greenhouse gardens, also in Florida, we sometimes see them in bloom. Many of the other and smaller species are seen in bloom more frequently. The evergreen species, like the true Century Plant, live the longest and bloom the seldomest, but the herbaceous kinds, like the Virginian and Spotted-leaved (Maculosa) usually bloom every year. I have a plant of the Yucca-leaved species, which is only three years old, showing flower just now. Its scape is already 11 feet high and still growing. When the Century Plant blooms, the crown from which the flower stem proceeded dies, as is the case with the banana, or, in fact, with any herbaceous plant; but a multitude of side growths, or suckers, remain to perpetuate the plant. The blooms of the ordinary Century Plant are not unlike those of our common yucca, and are arranged in candelabrum-fashion on stems some 20 to 40 feet high, according to the strength of the plant.

* *

JUST about this time of year we often have damp, muggy weather suddenly succeeded by hot sunshine, and we find our plants "scald" badly and often rot off. Shade is the only preventive of "scald" and in most cases shading is impracticable; but we can lessen the rot-evil to a great extent by keeping our plants free of decaying leaves, thinning out overcrowded leaves or growths, and keeping the surface soil so loose and well stirred that the least "air" will dry the top. Dry sand or dust charcoal strewn around the necks of plants, is also good. When by hoeing or otherwise the earth is worked up around the necks of the plants in basin-fashion rot is worse than in the case of level earth; indeed, where the plant crowns are elevated a little above the ground level, the rot is the least.

* *

THE other day, when scrambling over rugged Mount Munroe and peering down into Oakes's Gulf, a precipitous abyss a thousand feet below, we beheld a vast wreath of snow, and in ecstacy I remembered that at the head of that snow-filled gulch a year ago, I found that little beauty cassiope, the phyllodoce, the glaucous kalmia, violets, veronicas, pale castilleias, white orchids and many other alpine gems, and I straightway proposed to my companion that forthwith we descend thither and see nature's mountain garden. But in earnest, prosy innocence he answered me, "I have sent to London for Anthurium Andreanum and I want to see it bloom before I kill myself!" LEON.

RURALISMS

THE EDITOR, I understand, intends to publish this month the annual Fair Number of the RURAL, with an unusual number for free distribution. While this denotes great enterprise and wise forethought on the part of the publisher, it presents a rare opportunity for advertisers of all classes to make their wares known, and the shrewd business-man is not slow to avail himself of it. In this connection I wish to make a remark or two in regard to a deficiency quite too common among advertisers; I allude to the omission of prices, especially in the cases of novelties, new implements, etc. It is altogether unsatisfactory and little to the purpose to request that a price list be sent for. It is not necessary, of course, to insert a long list of prices (though some do it), and it is not needed in things commonly well known, or in advertising a business; but in the case of specialties and novelties, especially in implements and machinery, it seems to be quite necessary, and the omission, I am convinced, is generally a loss to the advertiser. Some understand this, but others do not. The small additional cost is nothing compared with the gain. I am inclined to look suspiciously at a new thing advertised without a price, and I know many others are, and never think of it again.

ABOUT July 18 the wistarias began coming into bloom again. This, in a small way, is not a thing of very unfrequent occurrence, and is commonly attributed to the weather, which doubtless has something to do with it. I had some plants then blooming profusely, however, which I think the sparrows had more to do with than the weather. Last Spring the little pests picked off nearly all the buds (of which they are very fond), and only a solitary flower here and there made its appearance. This disbudding seems to have had the usual effects of this operation. Speaking familiarly, I might say that the wistarias, knowing there are no sparrows about now, have resolved not to be altogether deprived of their usual Spring festival of flowers, and are having a good time of it, and we enjoy it. If the flowers had any special value at this season, the disbudding might be imitated. The sparrows were got rid of by persistently destroying their nests as fast as they made them. They finally got mad and went off. I might have shot them, only I could not find it in my heart to do it.

WHILE speaking of the wistaria, I will add, having tried it, that the double-flowering, sweet-scented Japan variety is a good subject for forcing, and could be made valuable for cut flowers for use by the florist. It is almost, if not quite, as fragrant as the best of the violets, and might be made to supplement this deliciously fragrant flower. It would, of course, be necessary to wire the individual flowers; but this is done with almost everything the florist uses. How far it could be made profitable to force it I do not know, but it is worth the attention of the florist for this purpose, and deserves to be grown out-of-doors, at least wherever a place can be found for it. But what an act of sacrilege to tear to pieces the noble clusters of the wistaria!

THE orange crop in California has already become so abundant, and the prices, in consequence, so low, that attention has been directed to its preservation in some other than its natural form. It would seem, from recent experiments, that its conversion into wine has been fixed upon as the most profitable. It is said to make a very palatable drink, and to sell at a good profit. The best oranges will be marketed and the smaller ones converted into so-called wine. Wine of this kind has been made in Florida, in a small way, and is well spoken of; but what I should like to know is, whether it makes a refreshing drink that is conducive to health. Of the other kind we have more than enough already.

IN a former number I spoke of Burr's New Pine as being the second strawberry to color with me. When I wrote I supposed the plants to be the Burr; but subsequently my suspicions became aroused, and on critically examining the foliage and the fruit, I found, much to my regret, that the plants were not true. I mention this that others may not be misled by my former remark. I gave a few plants to the Editor last Fall, and must now request him to remove the name to prevent further error. I have for years been trying to get the true Burr, and I do not mean to give it up yet. The above plants came to me in a way that led me to suppose I had the true kind.

AN article is "going the rounds" in which it is said that an Italian gardener has succeeded in raising fragrant camellias, and it is added that the colored kinds are more fragrant than the white. This may be so; but Italian gardeners have a reputation for doing queer things with plants, and the newspaper article does not come to us in a way to entitle it to unlimited confidence, to say the least of it. I would advise the readers of the RURAL to wait a while before investing much capital in fragrant camellias. When such really do come, I shall rejoice in common with all lovers of that noble flower.

OUR large cities are full of idlers and the country is overrun with tramps, yet farmers in many places have been unable to secure sufficient help at almost any price to get in their crops. During the past week (July 23) I have seen acres and acres of wheat lying just as the machine left it, for want of help at least to bind and stack it; and one enterprising farmer told me he had ridden over into an adjoining State and secured men at from $2 to $2 50 a day, rather than run the risk of loss by leaving his wheat in the field. His crop was an unusually fine one, and this probably had something to do with his willingness to pay well to get it under cover. Painstaking in growing a fine crop naturally leads to painstaking in securing it. Others had put the few men they had into the "harvest," and left their corn to chance and the weeds, and the latter were having a "tall" time of it. Those with whom I have talked do not seem to have been unwilling to pay the prices asked; the difficulty has been to get men at any price. It seems strange that this should be so when we consider the idlers, the tramps, and the immense number of immigrants that have poured into the country during the past year.

IT should be borne in mind that turnip seed of some kind or other may be sown during the whole month of August, the best for a late sowing being the Red-top Strap-leaved. There are always vacant places about the garden and field that may be profitably used in this way, and which are too commonly left to waste and weeds from simply not knowing what to put in them.

THE two most attractive climbers just now are the honeysuckle and the clematis, the latter not by any means as common as it should be; indeed, it may still be called a rare plant in its best forms. It may now be bought at a reasonable price, and the different classes or types afford varieties that will furnish an abundance of lovely flowers from Spring till Fall. It may be grown either as a climber or a trailer almost anywhere without being out of place, and is surpassed by few plants for bedding purposes. The colors are varied and beautiful, and the whole plant graceful to a degree. In regard to the honeysuckle, I repeat what I have said before, that L. Halliana is the best of them all.

A WELL-KNOWN horticulturist says in a letter that "people are beginning to find out that

there are better grapes than the Concord." Yes, and it has taken them a good while to learn it; but better late than never. It is encouraging, however, to know this. Years ago I predicted that we should yet have a native grape that, in its make-up and goodness, would compare favorably with the Black Hamburgh, and Mr. Ricketts and his worthy colaborers have put us well on the way to it. Nothing less than this will content me, and I do not think I stand entirely alone.

LADIES and other amateurs who have plants of the Scarlet Pelargonium too large for their room may put down cuttings early in August and have nice young winter-blooming plants by the time it is necessary to take them in. The cuttings should not be made from wood that is old and hard. Pot them off as soon as the roots appear, or even as soon as they are well callused. With a little care and encouragement they will often prove more satisfactory than large plants.

THE sooner now that new strawberry beds are made the better. The readers of the RURAL should not forget what has been said about frauds, and buy their pot-grown strawberry plants of well-known and reliable parties, of whom, thank goodness! we still have several left. Among new kinds the Bidwell will be a safe one to buy, but of novelties the Jersey Queen and possibly the Manchester will take the lead, and fill up two different seasons. There are now many good kinds on the lists to choose from, as the reader will see by referring to the Small Fruit Number. HORTICOLA.

Leveling Strawberries in the Baskets.

A DEALER who buys berries of me, and also reads the RURAL, said lately, "Why don't you tell your brother berry growers how to level the berries in the baskets; it adds 50 cents a crate to their value." I have not the opportunity of a dealer to learn how other growers "fix" their berries, and have supposed they understood the business as well at least as I do. But this dealer says it is not so. My pickers fill the baskets as full as they will stay on, heaped. When they are brought in an experienced hand—a woman hired for the purpose—throws out upon a table before her half a pint from the top of each basket and replaces them with the hulls down, so as to make a flat, level top, about three-eighths of an inch higher than the edge of the basket. This is what the buyer alluded to says increases the value to him 50 cents per crate. It does not cost 10 cents, and has always been done here because it prevents the mashing which is sure to attend the practice of leaving the berries in a conical form, or highest in the middle. T. H. H.

Orleans Co., Vt.

Gooseberries.

As these are just now ripe in abundance, I would remark that I prefer the Downing to any other variety for table use on account of its tender flesh and its very good, sweet flavor. The fruit is of fair size and of a greenish-white color. The plant is with me of moderate growth and very productive. Houghton's Seedling is of vigorous growth, but has rather slender branches and is remarkably productive, the fruit being of moderate size and of a pale red color. With me the berry remains longer in perfection than that of the Downing. I suppose I shall have to abandon the cultivation of the English varieties. They are so subject to mildew that it is impossible to obtain any fruit from them. If any of the readers of the RURAL have had any experience with them or can suggest any remedy for the mildew, I shall be pleased to hear from them. Have they been tried at the Rural Farm, and, if so, with what success? [Yes, mildew destroys them.—EDS.] CHAS. E. PARNELL.

Queens Co., L. I.

Entomological.

ŒSTRUS BOVIS.

FROM what appears on page 485 of the RURAL under the signature of Mr. Sereno Edwards Todd, it seems that either Mr. Todd or myself had better study the transformation of the Ox Bot-Fly. All I wish to do in this article is to correct a few of the writer's statements, and cite a few of the authorities or the writings of those who will doubtless be taken as authority. I could have done this in my first article, but I have always looked upon a popular newspaper article as no place for such dry details, unless it be for the purpose of correcting a wrong impression. From the citations I shall make the reader will doubtless see that I did not derive my information from cyclopedias, as the writer referred to seemed to infer.

In regard to the place where the eggs are deposited, whether glued to the hair or deposited beneath the skin, there is a difference of opinion, some good authorities being found on both sides, hence we will pass that point, as only an actual observation can decide it.

The statement that there is no orifice in the skin through which air may enter to sustain the life of the tender grub, I can not admit as a fact. Spending, as I did, the early part of my life on a dairy farm in Central New York, I may be presumed to have had some chance to observe the habits of this insect. I have always found an opening, during the Winter, at the summit of each bump on the backs of cattle, and never found any difficulty at the season in removing the grub with pressure by the thumbs. On this point E. B. Reed, in the report of the Ontario Entomological Society for the year 1873, page 38, says "It is, therefore, very essential to the grub that the hole of the tumor should remain constantly open, for by this operation a communication with the air necessary for respiration is preserved." Dr. Harris, in his Insects Injurious to Vegetation, page 624, says on the same point, "The maggots of the Œstrus Bovis, or Ox Bot-fly, live in large, open boils, sometimes called wormils or wurmals, that is, worm-holes, on the backs of cattle."

The statement that the larvæ "pass to the chrysalid state while in the adipose tissue of the ox or cow" I can not accept as a fact. I do not know of an instance where any species of this family of parasitic flies pupates in the body of its host. On this point Dr. Harris, in the book above referred to, page 622, says, "The larvæ or young of bot-flies live in various parts of the bodies of animals. * * When they are fully grown they drop to the ground and burrow in it a short distance. After this, the skin of the maggot becomes a hard brownish shell, within which the insect turns to a pupa, and finally to a fly." Reaumer says, as quoted by Mr. E. B. Reed in the Ontario report above referred to, "At last it comes out backwards and falls to the ground, when it gets under a stone or buries itself in the turf, remaining quiet, and preparing for its last transformation." Dr. A. S. Packard, Jr., one of the U. S. Ent. Commission, says in his Guide to the Study of Insects, page 405, "The larvæ are found during the month of May and in the Summer in the tumors on the backs of cattle, and when fully grown, which is generally in July, work their way out and fall to the ground." Further on, in relation to the length of the pupal period, he says, "They exist in the puparium twenty-six to thirty days, and the fly appears from June to September." But perhaps here is enough.

In regard to remedies, Mr. Todd's suggestion of the rubbing pole or carding is a good one, though with ordinary cattle the pole might fail to reach many. As I have intimated before, the process of squeezing them out and killing, will be as effectual as any means of killing them. G. H. FRENCH.

Farm Topics.

THE EVAPORATION OF FRUIT.—No. 1.

J. G. BINGHAM.

Its Necessity.

AMONG the great industries of our country the cultivation of fruit has reached a magnitude that is indeed surprising. The Yankee nation are enthusiasts in this branch of industry; they grasp after new varieties and eagerly test their qualities, that they may, if possible, improve upon the present supply.

Fruit culture is unquestionably profitable. It is a fact that in good fruit sections of the United States many orchards of from six to ten acres pay larger profits to the farmer than the 90 acres put into wheat or other farm products. That my readers may properly appreciate the importance of the fruit interest of the country it must be borne in mind that in the so-called fruit belts of the United States there are more than four and one-half million acres of land under cultivation in orchards. Carefully prepared statistics report the estimated value of our green fruits at $138,000,000, nearly half the value of our average wheat crop.

At our Centennial Exposition the show of fruits exceeded 60,000 dishes and over 400,000 specimens. Michigan values her apple crop at $2,000,000. Illinois has 320,000 acres in orchards. California sends East millions of baskets of grapes and pears, and will shortly supply the whole Union with raisins. The Gulf States rival Southern Europe in semi-tropical fruits. Delaware and Maryland produce from seven to fifteen million baskets of peaches per annum. New York City has received in one day 10,000 bushels of strawberries.

The fruit crop of 1880 was enormous; millions of bushels, more particularly of apples, were allowed to go to waste for want of a market. There is an authentic statement in the New York Tribune of August 23, 1871, that a single fruit grower of Delaware lost by rot 10,000 bushels of peaches, while the total loss during that season in that little State exceeded 50 times that amount. He would have been a benefactor indeed who could have rescued from decay this half million bushels of luscious peaches.

How to preserve the surplus is the question which has agitated the minds of farmer and fruit grower in time past. The solution of so important a problem, involving individual and, I may say, national, pecuniary interest, has been reached by *fruit evaporation*. In no one department of farm economy has there been as much interest manifested in the last few years as in the recent application of better methods and appliances for this special purpose. Erroneous principles and practices have, in a great measure, given way to more advanced methods, based on well-known facts in chemistry, comprehending the component elements of fruits, their growth, cell structure, development and preservation. The great progress made in this department of domestic economy is commensurate only with its importance in deciding the question, how to secure a universal and regular supply of fruit for all seasons and sections, combining all the healthful and nutritious properties of fresh, ripe fruit, which, when properly treated, is easily restored to the nearest possible former condition of freshness. The demand for evaporated fruits of all kinds has more than kept pace with the production, and prices have steadily advanced as the supply has opened up new markets, gaining in general favor and entering into consumption as a wholesome article of food instead of a mere luxury.

McGrawville, N. Y.

AN ENGLISH GRAIN CRUSHER.

Careful experiments with the omnibus horses of London show that there is an average gain of one-fourth, or twenty-five per cent., in crushing grain for feed. Much more attention is paid to saving grain in this way in England, France and Germany than in this country. Doubtless the main causes of this greater lack of thrift among us, especially in the thinly inhabited regions of the West, is the comparatively low price of grain and high cost of labor. If crushing grain however, makes a gain of one quarter in its nutritive value as stock feed, it should be much more widely practiced than it is at present, especially in the more thickly settled States whose denser population, closer proximity to market and greater diversity of agricultural industries render grain higher-priced than in the Frontier

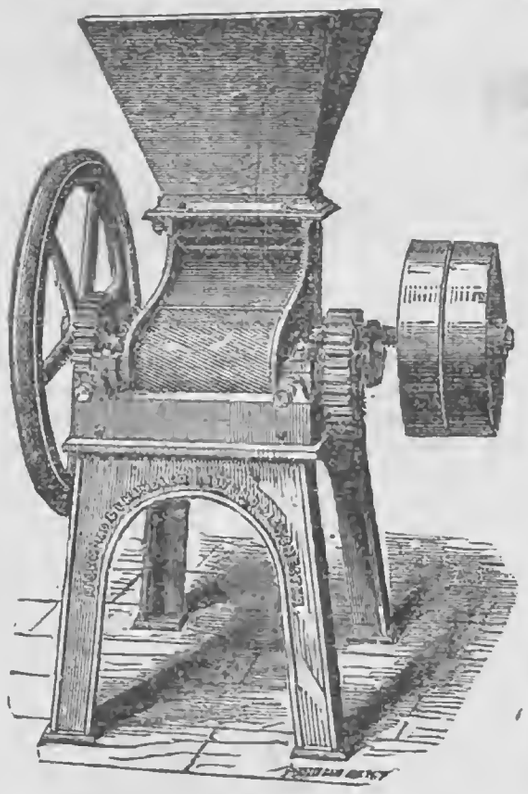

FIG 392.

States. From time to time we have presented to our readers engravings of the best grain crushers and feed grinders made in this country, and now we call their attention to an English grain crusher, shown at Fig. 392, which attracted considerable attention at the Paris Exposition of 1878. It is known as the Richmond & Chandler machine, and is made of various sizes and used for crushing beans, peas, oats, barley, corn, flaxseed, or malt. In it the "set" of the rollers is regulated by means of two thumb-screws in front of the machine, so that the grain may be crushed to the required degree of fineness. The feed of the grain to the rollers is determined by a small regulating wheel. There is also a machine known as a kibber which is designed for cracking oats, beans, and corn for horse feed. It is like a large coffee mill, with renewable iron plates, and a capacity for cracking into various degrees of fineness.

OIL-CAKE BREAKER.

THE Treasury statistics show that in 1880 there were exported from this country 458 023,225 pounds of oil-cake, valued at $6,259 827, against 340,995,395 pounds, valued at $4,394,010, in 1879. For the previous ten years the exports had been steadily increasing from 203,587 040 pounds in 1871, with the exception of a slight falling off of about 9,000,000 pounds in '73. It is doubtful whether the country does not lose more than it gains by this large trade—whether we would not be all the richer by keeping this vast amount of oil-cake at home to feed to our own flocks and herds, thus increasing the quantity and quality of our butter, cheese, beef, mutton and provisions for domestic consumption and exportation, besides adding to the amount of our manure piles and greatly improving their fertilizing properties. The United Kingdom

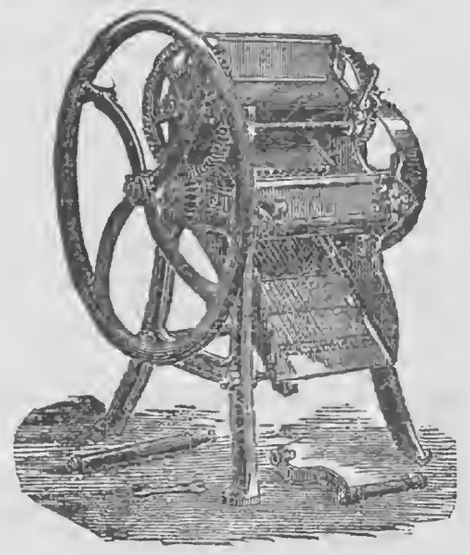

FIG. 393.

and France are the chief gainers by our improvidence in this respect, although Germany also has lately begun to be a considerable importer of our cotton-seed and flax-seed oil-cake. Beyond the Atlantic, European economy is rigidly practiced in the use of this article of feed, both in proportioning the proper amount to each class of animals, and in preparing it in the best way for obtaining all the advantages possible from it. For this purpose, the oil-cake breaker is an important device. One of the best forms in use in Great Britain is shown in engraving, Fig. 393. The cake is slipped edge-wise into the hopper, and is there gripped by a pair of spiked rollers, which reduce it to pieces suitable for sheep or beeves. Six different sizes of cake-meal are made by this machine, which is furnished with cleaning combs, to prevent the adhesion or clogging of damp cake. Boxes receive the broken cake and dust separately.

BREWERS' GRAIN.

THE hint thrown out by Prof. Storer in regard to the drying of brewers' grains in a late RURAL, is well worthy of consideration. But, after having used them for several years, I wish to point out to persons interested some circumstances which would affect the process of drying and some which relate to methods of preserving them. First, in regard to the prejudice against this excellent, nutritious, wholesome and cheap food for dairy cows. Boards of Health, who move in mysterious ways their duties to perform, and who think it right to prohibit the removal and temporary storage of manure, not only in the city of New York but in rural villages, and yet thus compel its retention in large stables in crowded and sweltering streets, have put their foot—so to speak—down upon brewers' grains and have peremptorily forbidden the selling of milk in the city of New York from dairies in which they are used. Further, the renowned Farmers' Club of the American Institute has put its foot, (a club foot?) also down upon brewers' grains and declares them to be an unwholesome and (to use a recent remark of the late Senator Conkling) "an abhorrent and forbidden" fodder.

Now I venture to say that not one of these persons who have thus put their foot down, knows the difference between brewers' grains and distillery waste, and actually confound the one with the other and with all the abominations, "abhorrent and forbidden," of the vile swill dairies. Those who know brewers' grains know them to be unobjectionable in every respect, a healthful and valuable food. And if there is any way in which the vast quantity of this waste product can be brought to distant dairies for use, it would be a great and useful economy. I have long been considering this question and believe the system of drying and pressing into cakes, the most feasible of all suggested methods. The German method of baking, mentioned by Prof. Storer, would be excellent if not too laborious and costly; but the pressure of the partly dried grains, between steam-heated plates, into solid cakes, would seem to be by no means too costly a process. If the cost would not be larger than the gain in the cost of freight upon the weight of the expelled moisture, the value of the product would not be really increased. But by whatever process the grains are prepared, it must be such as will prevent the loss of the soluble matter in the contained water to be got rid of. This moisture contains

a large quantity of glutinous and nitrogenous matter as well as sugar and gum. It will hang in thick strings from the floor of a car loaded with grains until it reaches the ground, and will dry on the car like glue. To dry by centrifugal machines would cause the loss of this valuable matter and leave the dry husk much less nutritious.

The method of preservation by ensilage has been in use for many years. I have kept them pressed in flour barrels for six months without difficulty or waste, and have packed 100 wagon-loads in an ice-house (without ice, of course), with perfect success. There are extensive dairymen in Westchester Co., N. Y., who have long practiced ensilage for keeping them. The silo is a stone pit at the end of the basement cow stable and opening into it by a door at the bottom, from which the grains are removed for use. The floor and sides are cemented and the open top, on a level with the ground at the end of the barn, is covered with a shed. When the pit is filled, the mass is covered with some straw and then with planks closely arranged. The mass settles by its own weight sufficiently to exclude air, and no pressure is required. Many thousand bushels are thus put away every season and a year's stock is laid in when the supply is abundant and the price cheap.

Corn starch waste, which is the same as the corn sugar or glucose waste, or "maize slump.' is another fodder substance that could be utilized in a similar way so as to be available for carriage to a distance of hundreds of miles; whereas in its soft and moist condition, like brewers' grains, it cannot be freighted profitably over 100 miles. H. STEWART.

A Good Way of Plowing.

HAVING tried all of the various ways of plowing, please let me suggest a plan of my own, which for convenience, ease to plowman and team, and also for expedition, I think cannot be beaten, *especially* where sulky plows are used.

If the field is fenced, run a furrow across each end six steps from the fence; if not fenced, five steps from the edge of the field. This will leave a strip five steps wide to plow in either case. Then run a back-furrow fifteen or sixteen steps, as the case may be, from either side; back-furrow on these until a strip is left the same width as at the ends; then forty steps from the back-furrow run another back-furrow, and plow until you have back-furrow off twenty steps; then you will have a land of the same width; that is, twenty steps: by laying off a field in this way, you can plow to the end furrow, throw out your plow and turn easily both team and man, on good hard ground, obviating all lifting and tugging for man, and backing and jerking for team. After all is plowed within, then commence on the outside strip, plowing from the fence, and you will have an evenly and well plowed field without any hard places and few back or dead furrows, and by this means, a flat field can oftentimes be drained. Successive plowings in this manner will raise the field into beds, using the dead furrows as ditches to carry off the water. C. A. MC C.

Princeton, Ia.

The Herdsman.

OUR ANIMAL PORTRAITS.

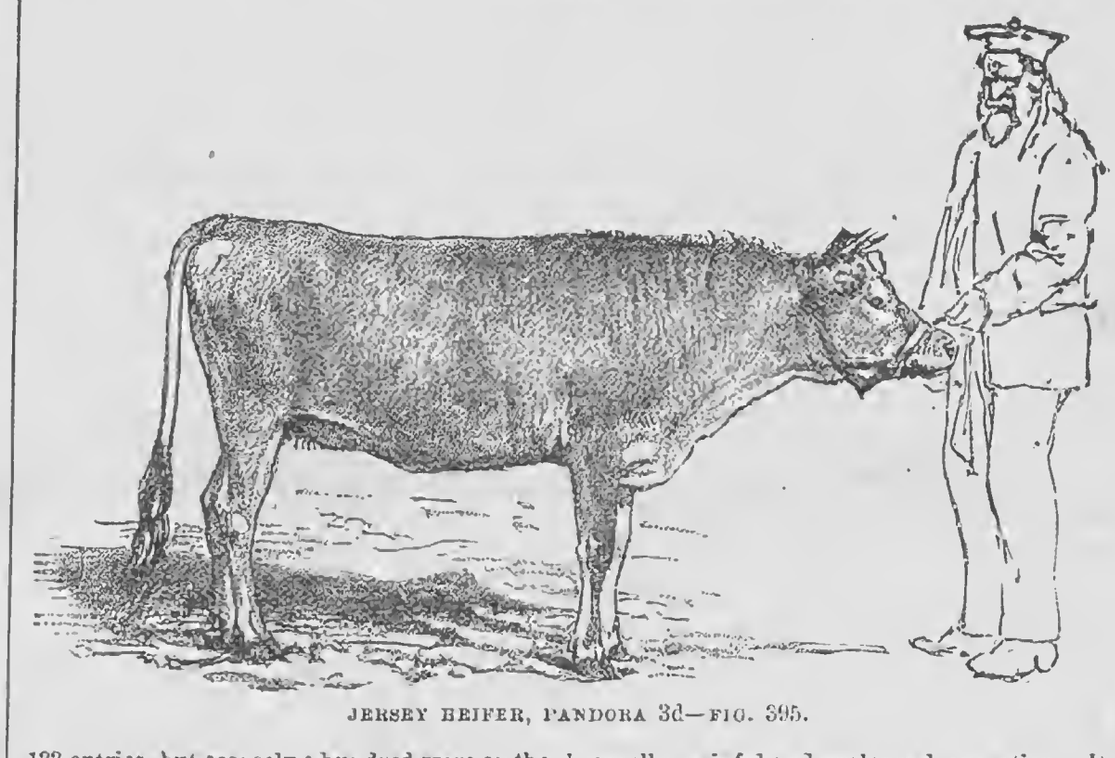
Jersey Heifers Patricia and Pandora, and Short-horn Cow Lady Carew 3d.

LIKE the agriculture of Great Britian, the Royal Agricultural Society of England has had much ill fortune to contend against for the last few years. Just as an excess of wet weather during the growing and harvesting season used to grievously damage the farmer's crops, so a tropical downpour during its annual great show dampened the spirits of the visitors and curtailed the receipts of the Society for the last two or three years. The harvest throughout England, however, by all accounts, will be a fair average one, as compared with those that cheered the farmer before the late era of agricultural depression, and the last show of the "Royal" shared in the bright fortune of the industry it was founded to promote.

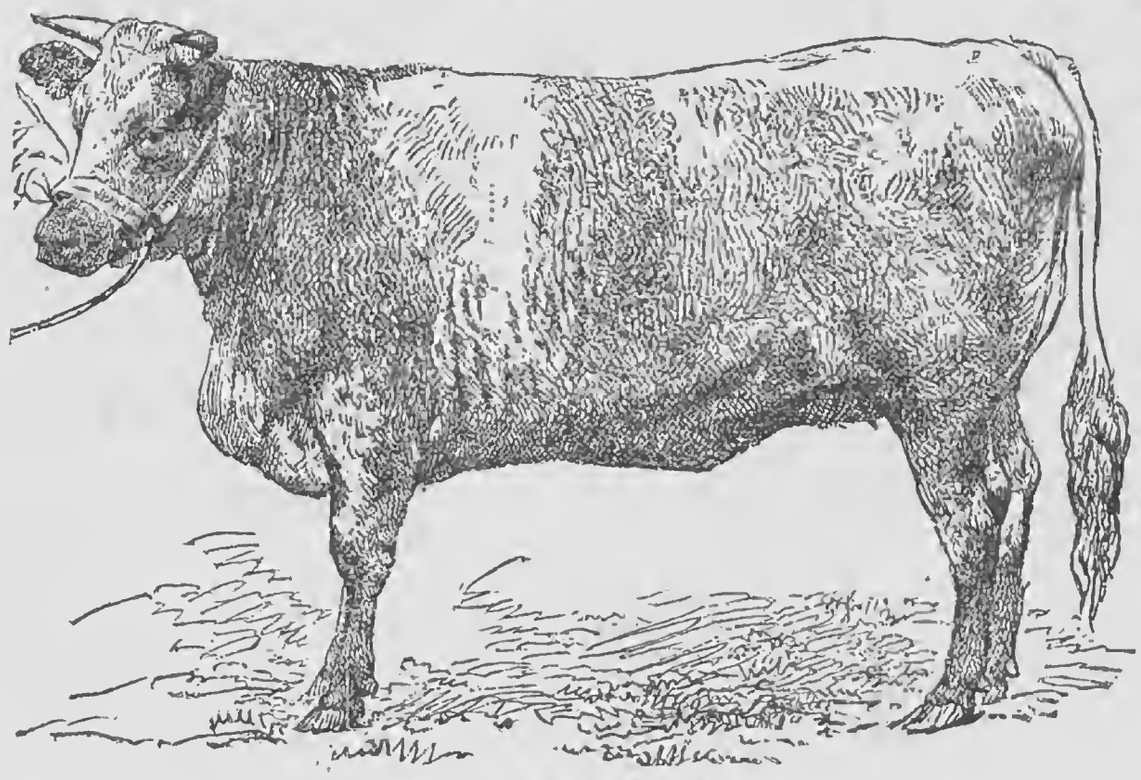
This great show took place at Derby from Wednesday, July 13, to Monday, July 18, both days inclusive. The weather was all that could be desired, except that the brilliancy of the sun had a trifle too much heat in it. The number of visitors was large and highly appreciative of the unusually fine exhibition prepared for their pleasure and instruction. A short time back the success of the show was greatly endangered by the prevalence of foot-and-mouth disease which led the Privy Council to issue Orders forbidding the movement of cattle, sheep and pigs, but the outbreak abated just in time to enable the Council to relax this order. Of horses, cattle, sheep and pigs, there were 1231 on exhibition, the cattle numbering 396, for which £1475 were offered in premiums. In Jerseys Mr. J. Simpson's silver-gray Patricia, which had just calved, won first prize in the Jersey class "for heifers in milk or in calf" and in the yearling class he again came to the front with another of his silver-grays, Pandora 3rd. Of these the Agricultural Gazette (from which we have re-engraved the accompanying likenesses) says that they had divided between them the champion prizes for the two best cows at the Royal Counties' show at Salisbury this year, and that Patricia has been exhibited five times, winning five first prizes, while Pandora has been exhibited four times, and taken four first prizes.

JERSEY HEIFER, PATRICIA—FIG 394.

LADY CAREW 3d.—In Short-horns there were 133 entries, but scarcely a hundred were on the ground. The Cow Class was a grand one. There were ten entries of choice animals, and after thorough deliberation the first prize was awarded to Mr. John Acker's Lady Carew 3rd, a beast with a grand, massive, level form, remarkably full and thick over the hips, with well sprung ribs and of good length and depth. Her only faults are said to be rather gaudy rumps, excessive fat, and a slightly stained nose. At the Essex County Fair, this year, she won the 100 guinea Challenge Cup for the best Short-horn in the yard. She also bore off the honors at the Bath and West of England Show the other day at Tunbridge Wells, and since then has also won the Havering Park Challenge Cup and had some other triumphs. Altogether, she is no doubt the best showyard Short-horn cow in England to-day.



JERSEY HEIFER, PANDORA 3d—FIG. 395.



LADY CAREW 3D, AS A HEIFER IN 1879—FIG. 396.

The Horseman.

FIRING FOR SPAVIN CRUEL, AND OFTEN USELESS.

C. W. GREGORY, an English veterinary surgeon, says in the Live Stock Journal, "During an active practice of 20 years, for the last ten I have not fired a single horse, although here in Bristol, the neighborhood being hilly, horses of all classes are severely worked. I have found mild and almost painless treatment *more speedy, more effective, and more permanent.* "In my opinion firing is unscientific. It is a cruelly painful and prolonged operation. Its results are very uncertain, and do not justify the operation. It considerably blemishes and consequently depreciates the money value as well as the owner's respect for his horse; and, finally, firing seldom removes, often does not diminish, and sometimes increases the disease under treatment."

Two years ago a favorite horse of mine, then at my country place, had become badly spavined on each leg, making it so lame as to be entirely useless. Although then 20 years old, it was so fine an animal, gentle and intelligent, I could not bear to give it up, and so called in the advice of a veterinary surgeon to see if the spavin could not be cured. He applied mild blisters and ointment, and in three months the horse became well enough to be used at light work, and has shown no lameness since. The spavin swellings are not reduced in size, still they do not blemish the legs.

Some years ago, every now and then, a car-horse used for city work, became spavined. I then had it fired and turned out to pasture for four or five months before it was sufficiently cured to be brought back to town. This was not only expensive, but a cruel operation, and I permitted it only from the advice of a skillful veterinary surgeon, who said a cure could not be effected in any other way. I have been greatly rejoiced to find since that a milder and more humane treatment of a horse is equally effectual. A. B. ALLEN.

Watering Horses.

In the RURAL of July 2d, some good advice is given on the above practice; but while looking at the circumstances as they actually exist, we readily see that in a majority of cases in the country where teams are used, it is very inconvenient and often impossible to water the teams as often as we would wish to; and the idea of drinking troughs in every field is simply impossible from the fact that no water could be conveyed into them. Now, if farm and other teams are watered regularly in the morning, twice at noon and at night throughout the season, no particular inconvenience will be felt, as it is well known that habit largely controls the desire for drinking both of man and beast. Care should be taken to water at regular intervals during the entire Summer—not several times a day for a part and only a few times for other parts of the season. If circumstances are such as to allow watering five or six times a day during warm weather, so much the better; but do not do so a part of the time and not all the time. I have known farmers that only drank at meal times and suffered no inconvenience from their moderation even in hot weather, it being the result of habit. SCRIBE.

The Swine-Herd.

CHEAP PRODUCTION OF PORK.

COL. CURTIS gave an excellent example of this in the RURAL of Jan. 29. A resort mostly to grass, clover, soiling crops and roots, is the only way in which the Eastern can compete with the more fertile Western States in the production of pork; and this I know from my own considerable experience, when rearing large numbers of swine years ago. There are other great advantages obtained by this method. The labor is much less, the pork is of a better quality, and the animals are kept almost perfectly healthy. If Western swine breeders would adopt this system set forth so clearly and simply by Col. Curtis, I am persuaded we should hear no more of "Hog Cholera" there. This would put an end to the foul, destructive disease which has caused a loss of millions of dollars annually to the farmers of the West for years past, and still continues there to a greater or less extent.

I am for calling things by their right names, and plainly stating facts. It is the only way to get at the truth of the matter, and insure a greatly needed reform. I say that "Hog Cholera" comes from mere filth, want of proper exercise, pure, fresh air, and feeding the animals almost exclusively in the hot season on highly fattening corn. A variety of food is what swine require and this should be mainly of a succulent character to help keep them healthy, especially in hot weather, and give them a due proportion of bone and muscle to the fat. Learned treaties by the dozen have been written on "Hog Cholera," and any number of remedies have been prescribed for it; and what have all these amounted to? Just nothing at all but a continuation, if anything worse, from year to year, of the loathsome, destructive disease. Swine breeders read what Col. Curtis has now written on rearing pigs and keeping their dams, and go and do likewise. This will put health in their bones, money in your pockets, and afford you the consciousness of acting rightly and humanely.

A. B. A.

Industrial Implements.

THE "DEERE SPRING" CULTIVATOR.

THIS implement, made by Deere & Co., Moline, Ill., has given complete satisfaction during the two seasons since its introduction in which time over 20,000 cultivators, we are told, have been sold. Among its many merits the makers claim that the new coupling and springs hold the first place. By shortening or lengthening the chains the weight on the springs is regulated according to the condition of the ground and the required depth. By the method here employed for attaching the springs not only are the shovel-rigs easily

hung up; but the side motion is so easy that each hill of corn can be hoed with little labor The spring assists all operations and does not lose its tension until the gangs are hung up. It is adjusted to carry as little or much weight of the gangs as desired, by hooking the chains in different links.

Miscellaneous.

RURAL BRIEFLETS.

ATTENTION to the strawberry beds at this season will help them another year. All weeds should be cut out and the ground mellowed about the plants and between the rows.....

CUT off a bud with an oblong slice of bark and insert this between the bark and the wood of the tree or shrub to be grafted. Here we have a short story of the process of budding. For the long story see the RURAL of July 26, 1879, page 482.....

BUDDING is a simpler operation than grafting, and every boy and girl should learn how to do it. It is now time to bud many kinds of fruit trees. See that the bark parts freely from the wood. Between the wood and bark is a mucilaginous substance which is really a thin layer of delicate young wood cells, and it is these which serve to unite the wood of the bud to the wood of the stock from which the bud is thereafter to derive its nourishment, the same as if it were an original part of the stock itself.....

CHOICE grape-vines suffering from drought, should be drenched with water and the soil covered with straw, hay, grass or even cornstalks.....

THE Broadway Agriculturist gives some very valuable hints respecting wheat. The gist of the article is that there are "good wheats and poor wheats." (!) It mentions the Clawson as having "gone through the mill" taking a "high rank as to quality of flour." (!) Then it says that "there are others." (!) We were going to reserve the above for our Wheat Number. But it occurred to us that all the papers in the land would copy it and that it would seem old by that time.....

ONE of our most valued lady contributors writes us: "I must tell you I *do* think there is something 'exceptionally fine' in Mrs. Garfield's conduct. I'm afraid *I* should have broken down under it: and she, too, just from a sick bed. Then she has such a discreet tongue, too. Most women are so demonstrative."

MR. STEWART says of Quack (Triticum repens) that it is one of those varieties of grass whose best qualities, when misapplied, give it a bad reputation. That's just the truth. We have little doubt that the day will come when seedsmen will offer its seeds for sale and that all men who purchase and sow will not be considered fools.....

WE believe that the RURAL is the first journal that has ever spoken a word in favor of this Quack, Quitch, Couch, Scutch or Rye Grass, and it has been hinted more than once since that we could have known little of it. But the RURAL has had it to deal with for over 13 years, and although it is at times annoying, we are free to say that if upon demand we could have every root at once removed from our farm, we should not make the demand.....

THE neighboring farmers, however, do not one of them join in our opinion, though not one of them has ever given it a fair trial. As soon as it appears, they fight it until it disappears. "It makes too much work"—they say. The fact is, however, and we have a right to speak positively, that let a sod consist of pure Quack when turned under, if the succeeding corn receive all the cultivation it *should* have the Quack will be exterminated. For the rest, we value the hay as highly as Timothy, while the best crop of corn ever raised at the Rural Farm was upon a Quack sod. At this time the drought is curling corn, killing clover, and the fields—save one—are brown. That one yielded about two tons of hay to the acre, though cut for the sixth year; and three-quarters of the sod is Quack.....

WE do not advice anybody to give this grass a footing upon his farm. We do not set ourselves up against the hundreds of farmers who condemn it *in toto* and whose judgment is the result of a longer and, possibly, a more discriminating experience. We do but state, in this case as in all others, our own convictions as they are arrived at from constant observation and experiment—and that is the foremost object of the Rural Farm.....

What Others Say

BED-BUGS.—We have found something about bed-bugs in our esteemed contemporary the Broadway Agriculturist, that should prove highly interesting to those whose houses are infested with this disgusting pest. A correspondent, it appears, having the misfortune to occupy a house in which "every crack in the floor and walls was full" of the insects, he commenced first with the bedsteads. These were taken down and each one "was painted from top to toe with paint in which kerosene was mixed." He suggests that kerosene alone would probably have done as well, of which we have no doubt. In his desperation he was led to cover his bedsteads with the mixture of paint and kerosene, but kerosene alone, applied to the joints only, would have served the end in view, which was to get rid of the insects already in the bedstead. Having freed the bedsteads, his next point was to keep the bugs out. He took old tomato cans, removed the tops, and set one under each leg of the bedstead, and partly filled them with water. This method was a complete success; the water in the cans offered an impassable barrier to the marauders, and he afterwards was free from the attacks of those established in the floor and walls. This insulation, so to speak, of the bedstead reminds us of an account of the intelligence of the scorpion, that we were told in Mexico. The scorpion makes a most painful bite, but it is by no means, as generally supposed, deadly. A Mexican officer told us that being where scorpions were especially abundant, he fitted his bedstead with dishes of water under the legs. This answered for a night or two, after which the scorpions climbed to the top of the room (for it can hardly be called ceiling), and dropped down upon his bed. If Yankee bed-bugs are as cute as the Mexican scorpions that are above described, the "protection will not protect."

MR. BERGH, president of our Society for Prevention of Cruelty to Animals, says in the organ of that society, never to whip your horse for becoming frightened at any object by the roadside, for if he sees a stump, a log, or a heap of tan-bark in the road, and, while he is eyeing it carefully, and about to pass it, you strike him with the whip, it is the log, stump, or the tan-bark that is hurting him in his way of reasoning, and the next time he will be more frightened. Give him time to smell all of these objects, and use the bridle to assist you in bringing him carefully to those objects of fear.

PLANTING EARLY POTATOES.—Mr. P. T. Quinn says in the Philadelphia Press that his practice has been to plant early potatoes in the Spring and to manure the ground heavily. These potatoes are ready for market by the middle of July, when they are dug and sold. The ground is then plowed, harrowed and marked out for strawberries. The rows are opened with a one-horse plow two feet and a-half apart, and about four inches deep. The young strawberry plants are taken up with great care and set out twelve inches apart in the rows. He always endeavors to get the bulk if not all of his planting done on or before the 10th of August. With ordinarily good growing weather, these plants increase in size and numbers, so as to make continuous rows, six, eight and sometimes twelve inches wide by the end of November. The spaces between the rows are kept clean and loose during the growing season by a small horse cultivator and one hand hoeing, to cut out any weeds which may come up in the rows. The intention is to have the beds entirely free from weeds before the end of the season.

WE say of a picture or a statue, "it is the expression of the artist's thought." So, too, a noble edifice is called an expression of the thought of the architect, and a fine park or garden likewise expresses the thought of the gardener. Run now, if you please, the dividing line through all the works of man, separating those which should be the expression of thought from those which need not be, and on which side of the line would you find the farmer's work? The question is asked by Mr. I. M. Hubbard in an essay before the Conn. Board of Agriculture.

"I NEED not dwell on the influence fairs have in spreading a knowledge of machines and appliances; the host of agents at every fair, however small, with all kinds of machines from a patent apple-corer or pot-washer to a steam thrasher or ditching machine, is evidence enough that the manufacturers of to-day believe, from experience, that this is a great and sure way to get a knowledge of their wares before the people. And we all know the eagerness of breeders of fine stock to exhibit and thus advertise their animals." We take the above from a very interesting essay by Prof. Brewer, delivered before the Conn. State Board of Agriculture and published in its recent Report, p. 115. T. S. Gold is the Secretary, West Cornwall, Conn.

SALTING PORK.—The Husbandman says that Mr. G. S. McCaun a few days ago, opened a barrel of pork that had stood in the cellar through Winter, and found the meat slightly tainted—not spoiled entirely, but the odor suspicious. He asked his club if there was any way to restore it?

S. M. Carr replied that if not much tainted, the pieces might be taken out and washed thoroughly, then soaked in buttermilk and afterward washed in clean water, when they may be re-packed and very possibly they would keep in good condition until required for use.

W. A. Armstrong remarked that the error was in salting. No farmer has a reasonable excuse for losing pork, provided the meat is entirely sound when it goes into the barrel. All he has to do is to cut the pieces of proper size, as nearly uniform as practicable; then put a layer of salt fully an inch thick on the bottom of the barrel; on that a layer of pieces set on edge, stowed closely, then cover with salt and fill all the interstices, and so continue until the barrel is full. At the proper time pour on brine as strong as it can be made. By this plan Mr. Armstrong kept pork four or five years as good as on the day it was packed.

KEEPING SWEET POTATOES.—Mr. T. S. Gold Secretary of the Conn., State Board of Agriculture, says in its latest report, "A gentleman in northern Ohio, who makes a business of raising sweet-potato plants for sale, and raises them by the hundred thousand, keeps his potatoes by carefully drying them and putting them in barrels, and those barrels are placed in an upper room in his house, in which he has a stove, and he keeps that room at a moderate temperature by the use of that stove, and preserves his potatoes perfectly for seed every year. He keeps hundreds of bushels through the Winter in that way. He is located in a northern climate, quite as cold as ours, and where the seasons are no more favorable for the maturity of the sweet potato than ours."

REMEDY FOR THE CODLING MOTH.—Mr. Woodward said, in the Report above alluded to, that he has tried in Western New York almost every remedy for the codling moths, and found them ineffectual. A friend of Mr. Woodward, in 1876, had what he called canker worms in his orchard, and wanted to know what he should do for them. He told him to get a force pump and syringe his trees with Paris-green. He did so, and later in the season he told Mr. Woodward the Paris-green had not only killed the canker worm, but the codling moth. Mr. Woodward went with him to the orchard, and one could tell where the Paris-green had been applied just as easily as he could see the row of trees. There were twenty times as many codling moths in the apples on one side of that line as there were on the other. Since then, Mr. Woodward has recommended it to many of his friends. He has tried it himself, and there is no more doubt of Paris-green being an entire preventive and specific for the codling moth than there is that it is an entire preventive and specific, if properly applied, for the Colorado beetle.

HINTS TO FLAX GROWERS.—The Minnesota Linseed Oil Company has issued the following letter of advice to its patrons respecting the cutting and curing of flax, and the hints here given are applicable to all places where flax is grown for the seed:—

"As the season for cutting flax approaches, we wish to give our friends a word of advice and caution as to harvesting and securing their crop.

First, cutting.—When most of the bolls and lower parts of the stalks have turned yellow, and the seeds have turned slightly brown, and the lower leaves have dropped off, it is ready to harvest. At this stage it will cut as easily as wheat. Be careful not to cut before ripe. Unripe seed cannot be properly filled out, and must fall short in weight.

Use a smooth knife in your reaper. Cut high—only low enough to get all the bolls.

Second, shocking.—Set it up as soon as cut, in gavels. It may be handled the same as barley or buckwheat; but, better still, bind with a self-binder and shock the same as wheat. This treatment makes thrashing easy and pays well.

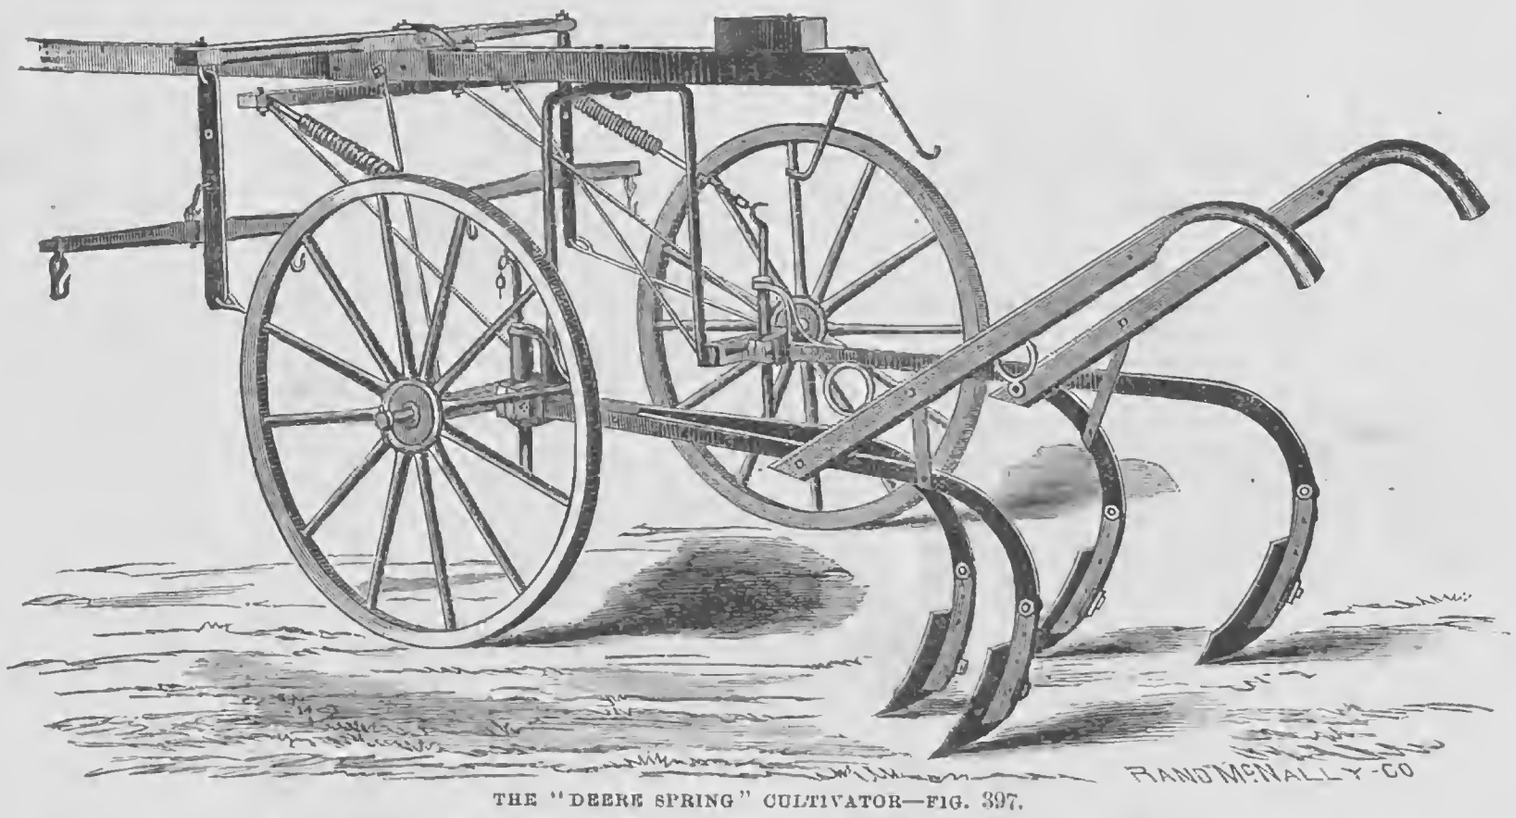
Third, stacking.—Flax cures very fast, and in good drying weather may be stacked the day after cutting. Don't waste a day after it is ready, for a thrashing machine or anything else, but stack, stack, if you want to save your crop. Build a good, solid stack, always keeping full in the center—heads in and butts out—and top out with prairie hay. Stacks must not be disturbed for two or three weeks, or more, until the flax is through the 'sweat,' which leaves the seed heavier and better.

Fourth, thrashing.—The 'Vibrator' and 'Minnesota Chief' are considered the best flax thrashers; but good work is also done with the Chase and other makes, with flax attachments."

THE BARBED WIRE FENCE.—Prof. S. A. Knapp, of the Iowa Agricultural College, in discussing the Barbed Wire Fence Monopoly, says: "It is gratuitous advice we offer on the subject of fencing, but among the items worthy of consideration is that of using less barbed wire. It is our observation and experience in building four wire fence, that the fence is in every way as serviceable and durable to use two barbed and two smooth—the top and third wires barbed; the second and bottom wires smooth. The smooth wire should be two-strand, steel, twisted wire—the same as barbed wire—and can be purchased or ordered of a factory at 5½ cents per rod. We are building such a fence upon the college farm at a cost of 35 cents per rod, dipping in coal tar. The posts are furnished by the farm."

THE Editor of the Rural Home takes occasional rides over his section of country, (Rochester, N. Y.) to observe the crops and ascertain the methods of the best farmers. One large farm of 300 acres through which he rode, he says, yields less clear profit, he was informed, than a patent mouse-trap invented by the proprietor. The mouse-trap probably accounts for the diminished profits of the farm.

THE best rule for salting butter is to salt to suit the taste of the consumer, says L. B. Arnold, in the N. Y. Tribune. There is no use in applying any particular amount of salt for the sake of preserving it, because the very lightest salting is always more than sufficient for all the effect salt can have as a preservative of butter. Generally one ounce of salt to sixteen ounces of butter is used.



THE "DEERE SPRING" CULTIVATOR—FIG. 397.

Two Pictures.—The Connecticut Farmer presents these two suggestive pictures from real life, that have come under its own observations:

"1. The boys like to read, and the master says, 'no time for readin', them tater bugs must be picked off,' and out the boy goes, though he only wanted to read just one piece after dinner. The best of everything is sold, for no buyer wishes second-rate articles, and if any suggestion is made concerning a new kind of pear tree or grape-vine, the answer is, 'I've no money to throw away for such truck, there's plenty of apples and wild grapes.' 2. A pleasant home; attractive dishes of fruit always handy; educated, home-loving boys; good society sought by father and mother and children; books by the best authors and 'papers that smell of the printing office'; an exceedingly neat farm, whose walls are made to last, where trees of all kinds of choice fruit are grown, and where the cultivated land yields just the kind the farmer wishes, for no weeds are allowed to grow, and, best of all, a proud mother saying to me, 'My boys never gave me an hour's pain in their lives."

Continuing our quotations from Secretary Garfield's Report of the Proceedings of the Michigan State Pomological Society and President Lyon's remarks: The Hawley has no superior in flavor among the very large mid-September apples. Its exceeding delicacy of texture unfits it for marketing abroad; but during its very short season it can hardly be excelled as a dessert apple. . . . . Jefferis is of medium size, striped, bright-colored and ripe the latter part of September and early October. Boys, those excellent judges of quality in fruit, award due praise to the Jefferis. . . . . Jersey Sweet as an early sweet apple, is hardly equaled by any other in high, rich flavor. . . . . Melon has hardly an equal among the larger early and mid-Winter apples. In beauty, delicacy of texture and excellence of flavor it is unexceptionable. . . . . Northern Spy is the King of the orchard, so far as the tree is concerned, and if by any fatality Mr. Lyon were compelled to choose a single variety for the supply of his own wants, t would beyond doubt be this. . . . . Pomme Gris only needs to be known to be appreciated. For the amateur it has no superior, if, indeed, it has its equal in all respects. . . . . Prof. S. W. Johnson says that (see Conn. Board of Ag. Reports, p. 86) one of the best parts of the education of children is the interesting matter which they read aloud in school. The giraffe, the kangaroo, the boa constrictor and other wonderful creatures that belong to strange countries, are not necessary to such instruction. The Alderney, the Devon, the Cotswold, the Colorado beetle and the codling moth would answer the same purpose. . . . . Mr. Potter, of the Mich. Pom. Society, said that he once heard of a man who took a great amount of pride in his three smart boys. The old man said they worked industriously in good weather and when it rained they would borrow his jack-knife and go out to the barn and trade that old knife among themselves until they had made fifty cents apiece, and then come and give him back his knife. . . . . President Lyon thinks the Early Joe is among apples what the Seckel is among pears. Its season in Southern Michigan is early September. . . . . Scarlet Pearmain, he says, is one of the richest and most beautiful of September apples. Lack of productiveness is almost its only defect. No amateur's orchard should be without it. . . . . Chenango Strawberry is one of the finest and most delicate in texture of the larger mid-September apples, and its great beauty, juiciness and mildness give it a high rank among even dessert apples. . . . . Farms never were cheaper according to their value than they are to-day in New England, but it is not because they have been "small farms well tilled," says the Vermont Journal. It is because they have been farms, large or small but generally very equal in size, *not* well tilled, for lack of money and lack of skill in their occupants. . . . . The man who acquires a skill superior to that of his fellow workmen and commands better wages is the one who *thinks*, says Dr. Hoskins. . . . . The farmer who told Lord Landsdowne that he was so accustomed to the company of "honest, plain-spoken people" that he felt out of place in the presence of His Lordship, showed that the simple truth is sometimes the sharpest kind of sarcasm. . . . . It is the pride of America that she offers an opportunity to the humblest to become great. We knew a boy who was so poor twenty-five years ago that he had to secretly borrow a loaf of cake from a passing baker's cart to keep himself from starving, while now he is one of the best shoemakers in Sing Sing. . . . . It is said that the real difference between a blunder and a mistake is this—When a man puts down a bad umbrella and takes up a good one he makes a mistake, but when he puts down a good one and take up a bad one he makes a blunder. For the former there is abundant excuse, but for the latter there is none at all.

BOOKS, CATALOGUES, ETC.

American Berkshire Record, published by the American Berkshire Association; edited by Phil. M. Springer, Secretary. Volume IV. Springfield, Ill., 1880. This is a handsome volume of 255 pages octavo, with numerous illustrations, carrying the male pedigrees up to the number of 3,305 and the females to 6,810.

The swine interest is one of the most important of American agricultural industries and the production of a superior quality of hams and bacon takes precedence in it. But these cannot be produced in the requisite perfection, unless a suitable breed of swine is kept especially adapted by their nature to do it. Of all races of swine the Berkshire excels in much the greatest proportion of tender, lean, juicy meat in its hams, shoulders and side-pieces. Hence their superior value for growing these, their popularity and the extra-high prices at which they rule. This also was the cause of grade Berkshires being so often palmed off upon the public by unscrupulous persons for thoroughbreds, which made it a necessity a few years ago to get up a record for their pedigrees so that breeders might thereafter know where to resort when they wished to replenish an old herd or start a new one.

Aside from the pedigrees, as above stated, this volume contains a valuable preface by the Secretary, Mr. Springer, the names of the various officers—twenty-seven in number—all well-known and highly respectable gentlemen; the Fifth Annual Report, of eight pages; the rules governing entries; and an essay on Demand and Supply.

We heartily commend this volume to all breeders of Berkshire swine, and assure them that they will greatly enhance the value of their stock by a record of their pedigrees in it.

Geo. S. Wales, Bannockburn Farm, Rochester, N. Y. Catalogue, of Pot-grown and Layer Strawberry Plants, Raspberries, Blackberries, Currants, Grape-Vines, etc. This list, as to both old and new sorts, is well selected. Mr. Wales also offers the Manchester Strawberry, which, he thinks, is the berry that has "long been sought for."

W. L. Ferris, Jr., 387 Main Street, Poughkeepsie, N. Y., Midsummer Catalogue of Small Fruits. The Manchester and Bidwell Strawberries and the Cuthbert and Gregg Raspberries are specialties.

TOBACCO-GROWING NOTES.

There is no rest for the successful tobacco grower from the time the seed is sown in the seed-bed until the fully matured plants, with their heavy green leaves, are safely housed in the curing barn. The entire season is a long struggle with weeds and insect enemies, and then "continual cultivation" is necessary in order that the plants may attain their fullest development.

It is the general opinion among experienced tobacco growers, that the seed bud of a tobacco plant should be broken off *before* the blossoms can be seen. All growth of top after the plants have produced their whole number of leaves, is practically lost, and the more strength that is allowed to pass into the top before the "topping" is done, the greater the loss of plant force. It is plainly seen that if the buds are pinched out as soon as they appear in the plants, there is less loss of plant growth than when allowed to form long tops with leaves and blossoms.

There is no definite rule that can be safely followed in the work of topping tobacco. It is impossible to fix a rule as to just how much of the plant should be broken off or the exact number of leaves that should be allowed to remain upon the stalk. Experience and good judgment are required to perform the work correctly. It is safe, however, to say that there is less danger of breaking off too many leaves with the top, than too few. If the top is broken off before it becomes of full growth, the strength of the entire plant is confined to leaf growth, which is the object desired. The best rule that can be given on the subject of topping tobacco, is to top *early* and *low*.

It is not best to undertake to top all the plants in a row, at one topping. The rows should be passed over as soon as the seed buds show above the leaves, and the tops of the most forward plants be broken off. The remaining backward plants should in turn be topped when they show their buds, and in order to make the crop ripen evenly it is best to top the late plants a leaf or two lower down than the earlier plants were topped, which will cause an even maturity of the crop.

It should be remembered that soundness of leaf is an important point in judging the quality of tobacco. Hence it is that great care should be used in working among the plants after they have become large, not to break or tear the leaves. The tobacco worm (Sphinx Carolina) should be thoroughly looked for and all that can be found destroyed. If worms of large size are found on plants, it is evidence that the tobacco has not been thoroughly "wormed." In seasons when the worms are numerous, the plants should be looked over at least twice a week, and all worms and worm-eggs that can be found, destroyed.

Experience with Chester Co. Mammoth Corn.

The Rural Corn Number of last Jan. 1, filled me with a strong desire to try my skill with "Chester Co. Mammoth." My experience thus far being somewhat different from that on the Rural Farm, it might interest Rural readers to know it. My first seed I bought of B S. Wood, Doe Run, Chester County, Pa., but not a quarter of it came up, owing to worms I think. I sent to Landreth & Company, of Philadelphia, and got seed to replant with. I have a fair stand now. A large portion of the field (10 acres) is in silk now, and unlike your experience, I find that generally each stalk has three ears growing from different joints. Here and there I find a stalk with two ears, quite a large number with four ears to the stalk, and occasionally I find a stalk bearing five and six ears, all from different joints, and as yet I have found none with but one ear to the stalk. I think in my case it would be desirable to "fix this habit," and I am now marking the earliest top ears on such stalks for my seed corn for next year. My corn field had a heavy growth of clover, which was turned under in March, and harrowed twice with the "Acme" Harrow. The corn was dropped with an "Albany" Planter, 20 inches apart, one grain in a place. As soon as it sprouted I ran the "Thomas" Harrow over it, and kept it going until it was one foot high; I then worked it three times with Perry's Scarifier, working shallow and level. The land is sandy loam, and has not been worked for four years. There was an old worn-out peach orchard on it, which we grubbed up last Fall. Before plowing down the clover, we scattered a thin coat of barnyard manure over the land. No other fertilizer was used. I inclose grain of the "Chester Co. Mammoth" received from Landreth. I suppose it is the same you refer to in your Corn Number. J. W. L.

Marshall Hall, Charles Co., Md.

[Yes, it is the same. Quite enough of "sets" also appeared on many (most) of our stalks; but except one or two, they did not develop. Hope to hear from your field after harvest.—Eds.]

How to Tell Sound Seed Corn.

I notice in the Rural crop reports that a great many have had trouble with their seed corn. I used to have the same trouble a good many years ago; but I have not had any for the last 15 years, since I learned to pick good seed corn, and I always take it out of the crib.

Now I will tell you how anybody can find out good seed corn, and if readers of the Rural will pay attention, it will benefit them thousands of dollars in the future. It is simply this:—Look at the chit of the grain; if it is smooth and glossy it will grow, and if it is blistered, it will not grow. I generally examine it by breaking into the ear and looking at the chits. Of course, the middle of the ear might be good and the ends not; but a little care about that will save all trouble. Now if any of my readers wishes to test this, he can do so now while he has some of the same corn he had last Spring. Let him pick out some in which the chits are smooth with not a blemish on them, and count the grains and put them in the ground, and see if every grain does not sprout; then take some in which the chits are blistered, and see how few of them will grow, and he will be satisfied that he can tell good seed corn. There is a difference between a chit that is blistered and one that is wrinkled: some are wrinkled naturally and are good; but if there is a blister on a chit, don't plant it—it will not grow. If you will take your knife and dig into it, you will find the germ, the sprout, dry and hard and loose, or the grain dried away from it, while a good, smooth one is soft and oily. Samuel Miller.

Allen Co., Ind.

Good Rural Branching Sorghum Seed.

I see by the issue of July 16, a statement that not over 15 per cent. of the Rural Branching Sorghum seed germinated on the Rural Farm. This does not correspond with my experience. I planted only 25 hills in the Spring, putting six seeds in a hill, and I got not less than two and not over four seeds to germinate per hill. When I saw the statement I got my package of seeds, and poured out 60 seeds, as they came out, and planted them in a box, and in about eight days 43 were up. I let them grow until now, so that I know that it is Sorghum. The way I manipulated the seed was to soak them in water near the stove for 48 hours and then I planted them. My sorghum is growing very fast. It is branched all it ought to I should think; it averages two and one-half feet high. I write this for I know that the seed that I have is better than the Rural calls for. R. W. C.

Stratford, Ct., Aug. 1.

Cheat or Chess.

About 33 years ago, when I was about 17 years old, my father said to my brother and myself, "Clear that three-acre field of new land, I will furnish seed and team and you can have the first crop." Well, we sowed it to wheat, and in the Fall the crop looked as well as the average run of wheat crops in the neighborhood; but in the Spring it seemed to have been much injured by the frost. On the three acres we had sowed four bushels and one half of seed as nice as any one could desire. Now mark the result: we harvested four bushels of inferior wheat and twenty-seven bushels of Chess. Now will the writer of the article on Cheat or Chess, in the Rural of July 16, explain the cause of the change.

Wayne, Mich. A Subscriber.

[There was no change; for every plant of Chess that grew, a seed was either sown, or lying in the ground.—Eds.]

A Large Yield of Wheat.

From two and three-fourths bushels of Red Stem Amber Wheat I thrashed, last Friday, July 29, 66 bushels of clean wheat. The drill was set to sow two bushels per acre. The plot was summer-fallowed and one-half was fertilized with phosphates; no other manure was used—soil fair loam, partly drained, and about one-half of the piece had a heavy clay subsoil. We were obliged to cut nearly all of it with the scythe, as it was lodged badly. R. C. H.

Canajoharie, N. Y.

Arboricultural.

THE WINTER-KILLING OF JAPANESE MAPLES IN FLUSHING, L. I.

SAMUEL PARSONS, JR.

The Winter of 1880 and 1881 in Flushing was unquestionably a severe, and in many ways, a peculiar one. Japanese maples in company with many other plants suffered considerably. It is only justice, however, to distinguish the Japanese maples that were injured from those that were not injured; for the number of the species of maples in Japan is great, far greater than elsewhere, and in one species at least, i. e. Polymorphum, the number of varieties also is legion. It is noteworthy, too, that all these species and varieties are widely diverse in behavior as well as in appearance. Indeed, the effects of last Winter, if nothing else, prove this conclusively. Members of the best known species or type—Polymorphum—suffered much in Flushing, and, contrary to ordinary experience, particularly in the case of the parent, Polymorphum itself. Good-sized, well-established plants of Polymorphum were, in some instances, cut down to half their original size. Roseo-marginatum, Cristatum and Alba laciniata, all Polymorphum varieties, were much injured, Altro-purpureum, likewise of the Polymorphum race, proved, however, unexpectedly hardy. The popular and splendid A. polymorphum (more properly palmatum) sanguineum and a beautiful weeping form also did well. The A. Japonicum and its varieties, large-leaved and rugged-looking, magnificent in form and color, suffered somewhat, while, strange to say, the delicate, tropical-looking foliage of the Palmatifidum and Pinnatifidum varieties, both purple and green, as well as the tender-looking, shred-like A. polymorphum rosea-pictis, showed no lack of enduring qualities during the past Winter.

On the other hand I saw lately on the south side of Long Island, on Mr. W. K. Vanderbilt's lawn, where the wind and sun had great power, all these varieties that have shown weakness in Flushing, standing entirely free from signs of injury, although laboring under the difficulty of having been transplanted only last year. Perhaps it was the sudden and protracted cold following a dry, hot season that did the damage, and perhaps much damage was done early in the Spring. It is very strange, however, to note how here, in this vicinity, they are injured and over there not. Of one thing we may be assured though: wherever the ground is cold, low and even rich there will be found, as a rule, the most winter-killing. A late, over-stimulated growth must succumb to an early and protracted cold spell. Fortunately, now, at the date of writing, all Japanese maples are so far recovered in their new growth from the effects of the past Winter, that, except in diminished size one would not know, unless told, that any damage had been done them. It may be a dozen years and more before a similar mishap will occur again; and, doubtless, it is because we prize these exquisite Japanese maples so much that we dwell with concern on their late unsatisfactory behavior. If there were only existing carefully kept records extending over a period of years, we would find, I believe, that almost all trees suffer at one time or another from winter-killing. The commonest hardy shrubs and trees die badly, we know, during some exceptional Winters. We must not condemn, therefore, Japanese maples in a sweeping manner on account of one partial failure strictly limited to certain varieties and localities; nor do I believe that a year or two

hence any one will hesitate to plant Japanese maples on accounnt of their behavior this year. People will take their chances with these maples as they have to take them with nearly all trees and shrubs. [The above seems to us a very reasonable view of the case.—EDS.]

Everywhere.

RURAL SPECIAL REPORTS.

Canada.

BELMONT, Nova Scotia, July 28.—Hay a good crop—about the average. All kinds of grain look well. Wheat is just heading out; not so much as usual has been sown on account of the weevil. Potatoes will be a light crop on account of cold and wet weather. Not much corn is raised and what there is is very sickly-looking. Haying commenced about the 15th but not much has been cut yet; there have been only two fine days since. Vegetables of all kinds look well. Our chief crops are potatoes, hay, beef, butter and pork. The prices at present are: hay $6@8 per ton: loose potatoes, old, 40c. per bush.; beef, $7@9.50 per cwt.; butter, 16c. per lb; pork, 7c. per lb.; eggs, 10c. per doz.; oats, 55c per bush.; flour, $6.50 per bbl.; corn-meal, $3.50 per bbl. Raising beef for the English market is now being entered into. A company has been formed for that purpose and is sending about 40 tons per month. A sugar refinery and a cotton and woolen factory have been started in Halifax. Times are looking brighter for this Province. Although we cannot boast of the large number of acres that the Western farmer has; yet we have one farmer here who has just built a barn 101 feet long, 40 feet wide, 16½ feet posts, with a cellar under all nine feet deep. He has, in addition, two barns 60x40 and one barn 100x30. He cuts 250 tons of hay. L. D.

Dakota Territory.

HAMILTON, Pembina Co., July 24.—The acreage of wheat, oats and barley is small as yet in this county. As it is only five years since any settlement of account has taken place in it, we are all new beginners. The acreage under cereals, however, is much larger than last year. Spring wheat is the staple here. (We can't grow winter wheat.) Quite a large number of varieties are grown; but Scotch Fife gives best satisfaction. Lost Nation out-yields it, but it is not liked by the millers. Spring wheat where sown on dry land is going to be heavy; but there was a good deal that was sown late, as we had a late, wet Spring; such will be light. Oats do splendidly here, yielding as high as 80 bushels per acre. This is an exceptional yield. There is not enough grown for home consumption. Barley does finely, but it is not much grown, as there is but little demand for it. Corn is not grown except in small patches and then it is rarely attended to, so that it does not amount to much; but what is properly cared for looks well. We grow Squaw and flint varieties which ripen here. I don't think apples will succeed here; currants and gooseberries do well, and there is an abundance of wild strawberries. This is a great potato country, and they are looking well this season, but there are a few potato bugs. The White Elephant Potato is doing finely, so are the oats, but the other seeds did not do well. I am highly pleased with the RURAL. J. F. H.

Illinois.

FULTON, Whitesides Co., August 1.—Winter wheat all killed; no Spring wheat to speak of—Odessa chiefly. Oat acreage about three per cent. increase over last year's; prospect slim until last week—thin on the ground which is very dry—mostly Norway and Surprise. Rye thin on the ground through winter-killing; no Spring rains to "make" it. Corn is backward, but generally clean and a good stand where it was planted deep enough—acreage the same as last year. There will be only one-fifth of a crop of apples; currants and gooseberries abundant. Snyder blackberries one-third of a crop; other kinds dead. H. E. S.

GALCONDA, Pope Co., July 30.—Thrashing began more than a week ago, and wheat will not turn out more than five bushels to the acre on an average. Grass and oats are good, but there is very little of the latter. The weather has been unprecedentedly hot—over 100° in the shade every day for a week—but there is no sickness on account of the intensely hot sun. The weather is very dry; we have had no rain of any account in this country since the first of the month. Corn is suffering badly, and if the drought keeps on a week longer, the crop will be ruined. Late potatoes planted in June will suffer, but those planted about July 1 will stand it better. Early potatoes have been very good; but not more than enough for home consumption was planted. Peaches on high ground, half a crop; very few apples. Prospects are not very bright for the farmer, although everything he has to sell brings a good price. J. K.

Kansas.

BLAINE, Pottawatamie Co., July 28.—Harvest is over, but it is far from a "bountiful harvest." A few pieces of Winter wheat were fair: most of the Spring wheat was left in the field; rust and chinch bugs took it. Oats were *good;* acreage larger than usual. Very little rye or barley sown. It has been very dry and hot for four weeks, and corn has suffered in consequence. More corn was planted than last year; but the prospects are that the yield will be considerably less. Potatoes were planted extensively, but they have been badly damaged by drought and beetles. Early sowings of flax are good; some that was sown late will not amount to much. Sorghum, of which there is considerable in this locality, is looking well. Of fruits, in the older orchards there is a good crop of apples, especially of the Ben Davis variety. Peaches are scarce, although most large trees have a few. Grapes a medium crop; plums (wild) an abundant crop. Strawberries and raspberries were good. Of the former we need better varieties than we have. Blackberries are all burned and dried up on the bushes. Light showers on the 23d and 24th, the first in four weeks, help the looks of vegetation somewhat; we need more. H. P. M.

LEAVENWORTH, Leavenworth Co., July 30.—The White Elephant sent me weighed 3½ ounces. I cut it into nine eyes and planted them 12 inches apart in a light sandy loam. At the same time I also planted a patch of Early Rose. The White Elephant was the first to make its appearance, followed six days afterwards by the Early Rose. The W. E. was much the stronger and it blossomed nine days earlier than the E. R. After the second hoeing I was unable to give the plants any personal attention, and the potato bugs completely cleaned out the patch of E. R., and not till then did they commence upon the W. E. The weather for the past month has been very hot and dry, still I dug my crop yesterday, with the following result: 44 tubers, weighing 5⅝ ounces. With regard to the other seeds, the oats and sorghum I gave to a friend who is farming in Northern Kansas, but have not heard from him since. The other seeds I have not planted yet, not having the time to devote to them. I shall, however, try both next season, when I hope to have more time to give them F. E. C.

Missouri.

BUCKLIN, Linn Co., July 26.—I was surprised to read the comments in the RURAL of July 16, that the Branching Sorghum seed failed to germinate. I believe every seed sent me grew and the stalks are now from four to five feet high. The White Elephant Potato is looking well. If it proves to be as good for a late potato as the Hebron is for early, we shall be more than pleased. And now I want to say a word in favor of the Red Jacket Strawberry. I received a dozen plants as a present in connection with an order for other plants, and they outstripped any other variety I ever tried. The few berries that I allowed to grow were large and delicious. Harvest is about over; oats good; hay very heavy; corn looking splendid. F. M. B.

New Jersey.

NEW GERMANTOWN, Hunterdon Co., July 28.—The White Elephant has done well. I planted every eye separately and thus got 11 hills. To-day from one small seed potato so treated, I dug 48 pounds, one tuber weighing 17 ounces. All tubers tried were first-rate for table use. S. A. P.

Nebraska.

PLUM VALLEY, Knox Co., July 30.—We have had a fine growing season with plenty of rain. The Spring was too wet and late for getting in wheat in good time, which makes it a poor crop,—acreage about the same as last year. Corn is looking well but late. Barley is short but well filled. Oats are good though not many were sown. Wheat is harvested; mine will thrash 10 bushels to the acre. J. P.

New York.

CANAJOHARIE, Montgomery Co., Aug. 1.—Farmers are nearly all through haying; the crop is somewhat better than last year. Potatoes are a light crop, owing to the drought and beetles. Corn late, although it is growing rapidly now. The RURAL seeds are all doing well except one package marked carnations; they proved to be rather poor pinks, and I have one common Sweet William. R. H.

GRAFTON, Rensselaer Co., Aug. 11.—The RURAL seeds were carefully planted. The carnations and picotees are now blooming, and a fine variety of splendid flowers they are, too. The Washington Oats have a splendid growth of strong straw, standing about six feet high, with very large stools. But above and beyond all the rest are the White Elephants, of which I have succeeded in getting 23 excellent hills. D. L. P.

Ohio.

KINGSTON, Ross Co., July 26.—Wheat about half thrashed in this county; so far the yield has been from six to 14 bushels per acre; the average yield in the county will be 10 bushels per acre against 18½ last year. The present indications are that the corn crop will be short, at least one-fourth less than last year's, both in yield and acreage, in consequence of dry weather and late planting. From July 1st to 10th, the most extreme heat ever known in this county was experienced, the thermometer indicating upon two occasions 107°, and once, 102°, in the shade. Several times it was 104° and 100. O. P. G.

WAYNE Co, July 30.—Wheat harvest is over and people are thrashing; the yield will average about one-half of what was anticipated before harvest. I have a nice piece of Mold's Oats from the produce of the seed sent last Winter a year ago. The Washington Oats look nice now. The White Elephant from appearances gives promise of an abundant yield. I have been petting the R.-B. Sorghum, but do not think it will succeed here for feed as well as corn. A. L. G.

Pennsylvania.

DARLINGTON, Beaver Co., Aug. 1.—Wheat at harvesting seemed a fair crop; the straw was heavy and had lodged a good deal. Some, however, have thrashed, and the yield is not turning out well. Oats are a fair crop; hay was never better. Corn is not very good owing to bad seed and wet weather. The RURAL seeds are doing well. Apples not half a crop; no blackberries. E. M'C.

The Querist.

ANSWERS TO CORRESPONDENTS.

Barley Growing.

J. W. S., Ash Grove, Mo., asks, 1, what is the best time to sow barley and how much seed should be sown to the acre; 2, how soon after harvest may it be stacked in good weather; 3, is the fly as destructive to it as to wheat; 4, is it not a more profitable crop than wheat.

ANS.—1. Barley should be sown earlier than wheat and it is the rule to sow it in the latter part of August if possible. 2. It requires more seed than wheat, and two bushels to the acre are generally sown. 3. The price of barley depends so much on its bright color that farmers are anxious to get it secured as soon as possible and it is usually put in barn or stack within a week of cutting. If it is evenly ripened and the weather good for curing, it can be hauled in the fourth or fifth day from cutting. 4. We think the fly works on the barley as much as on wheat; but as barley is always sown on the best land, the crop is seldom destroyed from this cause, as it has vitality enough to resist it. 5. We doubt, all things considered, if the crop is more profitable than wheat, for the following reasons: 1st. It takes the best land to grow barley, either bottom or a warm, black upland—precisely such land as suits Indian corn is good for barley—and a strong clay, which will grow excellent wheat, will not grow a profitable barley crop. 2nd, The risk of the crop is much greater than that of wheat. A day or two of rainy weather, which will not damage a wheat crop at all, will stain the barley and reduce its market value largely. 3d, It is very uncertain what one will get for it as it is subject to great fluctuations in price, and, unless one is able to hold the crop over a year, he must often sell at a price that will give no profit. We believe that the same quality of land it takes to grow barley will, in the long run, pay better in wheat. Lastly, we would much rather grow a crop that helps to feed the world than one which is made into beer to demoralize our boys and be guzzled by men whose families need every dollar so spent.

Budding Peach Trees.

T. T. K., Outlet, Lucerne Co., Pa., wishes to know, 1, when to cut peach buds for budding 2, the best time to bud; 3, how to treat the trees after they are budded.

ANS.—1. Peach tree buds should not be cut more than a half day or so before they are used. 2. Budding is done in August and September, though it may be prolonged in some sections even into October. As a general rule, budding may begin as soon as as the buds are large enough to cut from the twig, and be continued as long as the sap flows freely. From the middle of August to the middle of September we should think a good time for this work. 3. The buds should be examined in about two weeks after they are set, and those that have taken, will have a lively green appearance. If the ties are cutting the buds, they should be loosened or cut. In another week or two if the bud appears to be flourishing, remove the band, but if this is not the case, let it remain until Spring when the sap begins to flow. All bands should be then cut. In the Spring cut away the natural stocks just above the bud. This must not be done too early on account of frost, nor too late since much sap will be drawn from the roots by the limbs, and also numerous suckers will be thrown up from the stem. In two or three weeks after topping, or sooner if the growth has been rapid, all natural buds *below* the cion must be rubbed off, and repeat the process a week or two later. Keep the ground about the stocks free from weeds, loose and friable.

Scaly Legs in Poultry.

L. D., Belmont, Nova Scotia, asks for the cause of, and a remedy for, scaly legs in poultry.

ANS.—Dr. Moxen and Mr. Tegetmeier, after carefully examining the scurfy or scaly matter on the legs of fowls, under a microscope, ascertained that it is due to the presence of a minute acarus, or mite, allied to the itch insect on the human subject. As a remedy they advise to soak the legs in warm water so as to remove the scurf without injury, and then to apply sulphur ointment, to be had at the nearest druggist's. We have cured it, however, by washing the legs as above described and rubbing kerosene freely upon them while they are held upwards, so that it can penetrate under the scales. They should have wholesome diet, including animal food at least once a day. Another remedy is to wash the legs with a *weak* solution of sugar of lead in the morning and anoint them with clean lard mixed with ointment of creosote just before going to roost. The affected birds should be separated from the rest of the flock so soon as the first symptom of the malady appears, as it is extremely "catching." The ailing fowls should not be exposed to rains or even permitted to roam on wet grass, but be kept quiet until the disease disappears, which it will do in from eight to ten days, if properly treated.

Miscellaneous.

F. M. B., Bucklin, Mo., asks, 1, whether there is any truth in the statement of the agent of an Ohio nursery firm, who says that Russian apples budded on Russian stocks are borer-proof; 2, what are the merits of the Weaver Plum; 3, is it true that the Lady Grape has only one seed.

ANS.—1. No truth in the statement, we believe. 2. Ellwanger & Barry say (and there are few better authorities) that it is simply one of our ordinary wild plums of fine size, good flavor and productive. The tree is hardy. Where good, cultivated plums can be raised, the Weaver may not have much value. 3. We have never noticed it or before heard that the Lady Grape has only one seed.

D. K. Litchfield, Mich., sends samples of earth for name, and to learn whether their presence in the soil indicates any undetected source of wealth.

ANS.—The samples marked No. 1 and No. 2, are principally carbonate of lime. Nos. 0 and 4 are pieces of granite. No. 3 is argillaceous matter. None of the samples is of any value, nor does their presence in the soil indicate anything especial.

L. E. V. Bothwell, Ont., Canada, asks, 1, where can the Saunaker Wheat be obtained; 2, a description of it. He has tried the Lancaster Red there, but it failed on account of the straw being too soft and it lacked hardiness, especially where the ground was wet.

ANS.—We know not whether it is offered for sale. A description will appear in the Wheat Number.

J. P., Plum Valley, Neb., asks, 1, the best time to set Black-cap raspberries; 2, when should strawberries be set and how far apart.

ANS.—The Fall (October) is as good a time as any. 2. In August and September, or in the Spring, as you prefer. One foot apart in the rows—the rows two feet apart for garden cultivation.

E. K., Thoroughfare, Va., says they are having a frightful drought in that section; the potato beetles are doing a world of mischief and he asks how to destroy them.

ANS.—Use London-purple or Paris-green, mixed with water in proportion of a tablespoonful of poison to a pail of water.

J. I. D., Elgin, Ill., asks, where can evergreen seeds of different sorts be obtained.

ANS.—Of Thomas Meehan, Germantown, Pa.; Robert Douglas, Waukegan, Ill.; Thorburn & Co., 17 John St., N. Y. City.

L. W., Allison, Ill., asks where can Lost Nation Wheat be purchased.

ANS.—We procured our seed of Dr. T. H. Hoskins, Newport, Vt. He can supply it or give information where it can be obtained.

G. B. R., Mountain Home, Idaho, sends a wild flower for name.

ANS.—A leaf, bud and flower would be required. We do not recognize it by the dried flower alone.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, AUG. 6.

B. W.—W. F. K.—H. P. M., thanks—J. M.—A. K.—Chas. Carson, many thanks—J. P. P.—H. D. F.—B. S.—L. B. A.—E. W.—A. W. J.—N. J. S.—W. F. R., thanks for Bermuda heads. We shall plant them under glass.—C. THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, AUG. 13, 1881

We have decided to have the Wheat Number *follow* the Fair Number. The latter will reach our subscribers Sep. 3. the former Sept. 10.

See page 542 for annual Fair List of the Rural New-Yorker.

Fair Trade instead of Free Trade is becoming Great Britain's maxim. After preaching Free Trade for 35 years to her peers among the Nations and forcing the practice of it with the bayonet down the gullets of the Chinese and other helpless races, she is now beginning to become a pervert to her own Faith so soon as her interests seem to be endangered by adherence to it.

The severity of the drought on Long Island may be understood when we state that peaches, pears and grapes are shriveling and drying up upon the trees and vines. To save the fruit of our experiment grape-vines, we have hoed the surface soil from each vine leaving it in circular ridges about each stem, then applied five or six pails of water, replaced the earth and covered with salt-meadow hay. All plants may be carried through droughts in this way.

We have made such arrangements for the coming subscription season that we hope to escape all errors which have hitherto originated in this office. Last year we were so cramped for room that our assistants stood in each others' way and all worked at a great disadvantage. This year we shall have plenty of room and all the assistance required. We shall endeavor to supply our seeds in the order in which the applications are made and to close the Distribution early enough to satisfy our Southern friends. Those who subscribe for other papers with which the Rural may club are promised on our part prompt and careful attention to their orders.

A Visiting Texan.—We hear much about the superior qualities of thoroughbred Jerseys, Holsteins, Devons *et al.* but when you want a first-class sensational scare, let a long-horned bristly-backed Texan, fresh from the prairies get loose in the streets, and all the fancy breeds are nowhere. That is the Texan's peculiar *forte*. A while ago one of these foreigners started out to see the sights in New York, soon after he landed. His line of march was up Second St, and shortly, he met a man who tried to persuade a cessation of hostilities but the Texan "drove him to the wall" or rather through a doorway, and went on. He then advanced on a flagman who attempted to turn him back with a flag, but this is considered a challenge to battle by unscrupulous Texans, so he pursued the fleeing flagman who suddenly felt himself elevated in position, and when he again reached *terra firma* he was some fifteen feet from his starting point, and slightly bruised. After this little fiasco the steer changed his course colliding with various peanut stands until he was finally "cornered" by a lot of carts, lassoed and carried to the abattoir on a truck.

A Device for Discovering Subterranean Water.—Witch Hazel has long been used by "common people" to discover subterranean water, to the amusement or contempt of the scientist skeptical of its virtue. The latter, however has at length hit upon a device of his own for accomplishing the same object. Our readers are aware that the microphone is a newly discovered device by means of which the volume of sound is enormously increased, so that sounds otherwise inaudible to the most sensitive ear, are heard with marvelous distinctness. This is the means which has lately been successfully used to discover underground water. Count Enzenberg has an estate in the Tyrol, which has suffered severely from lack of natural moisture. From the formation of the hills and the density of the woods it had long been suspected that there were on it a number of hidden springs. Along the foot of the hills the Count placed several microphones and connected them with an insulated telephone and a small battery. At night, when the vibrations of the soil and all other noises are fewest, he listened for subterranean ripples, and already he has thus been enabled to discover several springs which he has turned to practical purposes. Could not the learned Professors who are now hunting for underground water on our Western plains, utilize the same device, or, at any rate, test its utility under unfavorable conditions?

The Rain Tree (Tamai capsi) seems to be in most respects the opposite of the Eucalyptus. The latter absorbs great quantities of moisture from the ground and exhales it into the air, thus drying up surrounding marshes; the former absorbs great quantities of moisture from the air and lets it drip on the ground beneath, thus converting the surrounding soil into a veritable marsh. The French consul at Loreto, Mexico, says the tree grows to the hight of 60 feet with a diameter of three feet at its base; that it possesses the power of strongly attracting, absorbing and condensing the humidity of the atmosphere, and that water is always dripping copiously from its trunk, especially in Summer when the rivers are all nearly dried up and the tree is most active. Lately some travelers in traversing an arid and desolate tract of country in South America, were struck by a strange contrast, says Nature: on one side was a barren desert; on the other a rich and luxuriant vegetation which was due to the presence of the Rain Tree. Why should not the admirable quality said to be possessed by this tree be utilized on our arid Western plains? We commend the investigation of the subject to the Commissioner of Agriculture. A part of the money uselessly sunk in a "dry hole" near Fort Lyon, might have been usefully expended in planting this tree in the arid parts of "The Great American Desert," if what is said in its favor approximates the truth.

RENOVATE THE WHITE HOUSE.

We do not assume to advise those who are in governmental authority over us, but we simply suggest that it is high time that some process of renovation be undertaken at the Presidential Mansion whereby the malarial influences may be counteracted. The recent statement of one of the President's attending physicians that certain rooms and closets were so poorly ventilated, and the air and gases therefrom were so infected with disease germs, as to be positively injurious to health, is a statement which should have weight. Those who have occupied the White House for the last few years have felt these injurious effects and there should be no longer any delay in thoroughly renovating and reconstructing, if need be, the entire building. We are terribly shocked when our President is brought near death's door by the hand of an assassin, but let us not nourish in parlor and drawing-room the very germs of a disease which is far more to be feared than the wicked designs of all the crazy men in christendom.

WELLS AND CESSPOOLS.

The fact that in New Haven, Conn., about 500 wells have been lately abandoned on account of their proximity to cesspools and other sinks of disease, calls attention to the necessity of building wells and cesspools at as great a distance as possible from each other. One of the most, if not the most, prolific sources of disease is the foul matter with which our drinking water becomes infected, and yet how little is done to prevent such infection. New Haven people are beginning to realize their danger, and we do not think New Haven an exceptional place for impure wells and cisterns. In every city or village and on many farms disease is generated by just such means, and yet we wonder why we become sick, and are satisfied when the physician pronounces it a widespreading "malaria." As long as the farmer's well emits no unpleasant odor, and the quality of the water is not positively bad, no notice whatever is taken of it, albeit a cesspool is not ten feet away. Let us not "go to destruction" when we have the means of prevention in our hands.

ARBITRATION vs STRIKES.

There is sound good sense in the way all difficulties as to wages, are settled between a large firm in this city and their 1,500 employés, and the policy should be adopted wherever there is any tendency for labor and capital to conflict. A Board of Arbitration, composed of nine members, five of whom are workmen, consider all questions of advance in wages, hours of labor, etc., on the ground of mutual confidence and justice. An election of arbiters among the workmen is attended with almost the excitement and interest of an election to public office, great care being taken to get the best men for the place. Fifteen representative men are chosen and they, in turn, choose five out of their number to serve on the Board. The Board has been in existence two and a half years, and all differences have been adjusted with complete satisfaction to both employers and employes. By this means wise counsel and peaceful deliberation take the place of inconsiderate action and fierce passion and the system has brought the firm and their workmen into the best of relations. The adoption of such a course wherever many laborers are employed would, in eight cases out of ten, be attended with the most satisfactory results.

AMERICAN WINES.

If there were needed any sufficient reason for Americans to look with favor upon the products of their own native vineyards and with disfavor upon foreign wines, the fact that our wines are the pure juice of the grape and foreign wines impure and sophisticated abominations should furnish that reason. American wine manufacture is a new art, but even at this early day our product has reached to one half of our consumption. Last year we made six million gallons and imported precisely the same quantity. Unfortunately, so persistently prejudiced are the American people in favor of imported foreign products, that the greater part of the American-made wines are sold as choice foreign kinds, with false brands upon them. The bulk of the real foreign wines is vastly inferior. But "who hath believed our report" when we have reiterated time and again this fact? And now we have some fresh evidence of the same sort, only, so to speak, "more so." It comes from foreign parts and is imported direct from Paris and should therefore be received at least with as much confidence as the French wines themselves. This report, taken from statistics of the Paris municipal laboratory, where the food analyses required by law are made, shows, among other facts, that in the month of June 455 samples of wine were examined, and of these but 14 were found to be good; 123 were reported tolerable, and 318 bad. Of 455 samples but 14 were good! If the French people thus treat themselves, what consideration might a foreigner expect, and how many samples of real imported wines (excluding the American sold for foreign) might be found to be even tolerable and without any distinct shade of goodness at all?

FRENCH IMPORTS OF AMERICAN FLOUR

Lately the Flour Commission of the Society of Agriculturists of France reported that the agricultural and milling interests were greatly disturbed at the enormous increase in the importation of American flour into western Europe. This increase amounted in France to 53 per cent in 1879, and since then importations have been steadily increasing. English millers are also greatly "exercised" on the same account, but they have not hit upon the ingenious French theory to account for our growing exportations of flour instead of wheat. According to our astute Gallic friends, we have substituted flour for wheat with the direct purpose of annihilating the English and French milling industries in order in this way to bring about the ruin of the agricultural industries in both countries also; for farmers no longer finding any purchasers for their grain, would be forced to discontinue its production, giving us shrewd, far-sighted Americans a permanent market at prices limited only by our own moderation and generosity!

To say nothing of the great reduction of freight secured by sending abroad flour instead of wheat, the 30 per cent. of bran and inferior flour thus kept in this country is as great a benefit to our own farmers as it is a disadvantage to those of England and France, as it enables us to keep more cattle and other stock, while it forces them to keep less, thus giving us an advantage in the competition in the European meat markets. Of course, the chagrin of our French friends is quite pardonable, but then their recommendation to impose an import duty of 10 francs per *setier* (2½ bushels) on all products manufactured from cereals is carrying their chagrin really a trifle too far.

BREVITIES.

It will be remembered that last year from about 70 different kinds of potatoes, we did not succeed in finding one seed ball. This year several kinds (new seedlings) fruit quite freely,

A great deal of complaint was last year made as to the rotting of tomatoes when half-ripe. This year the same trouble exists. We find that the tomato worm is causing much of this. Sometimes this disgusting worm prefers the green fruit to the leaves and eats a small portion, returning to the leaf. Every tomato so harmed will rot. The best way to destroy these pests is to go over the vines with scissors in hand and cut them in two.

A paragraph has been "going the rounds" of the papers stating that the Italian government has offered a large reward for a remedy against some parasite or disease which damages orange and lemon trees. The Italian Legation in Washington has been receiving hundreds of inquries from all parts of the country on this subject, and as it is impossible to answer all correspondents. Individually, Count Camporeale, Chargé d' Affaires of Italy, announces that so far nothing whatever of such a reward is known to the Legation.

Frederick Martin has the reputation, among our English cousins, of being a perfect encyclopedia of information. Some of our Western friends, however, may possibly think that this encyclopedia, like most others, is sometimes misleading. In the "Statesman's Year Book" for 1880, after giving a good deal of statistics of the area and population of this country, he adds: "The States and Territories here enumerated do not occupy the whole area belonging to the United States. There are, besides, vast tracts of land described as "Kansas," "Minnesota," "Nebraska," "Oregon" and the "Indian Country," not as yet organized."

Dr. John A. Warder, the eminent pomologist and President of the Ohio State Pom. Society, reminds members and others that the Summer meeting will be held on Wednesday evening, August 21, at the time of the State Fair, at Columbus. All are invited to bring specimens of new fruits, and also contributions to the Bateham Memorial Fund, as the committee desire to report. We trust that all our Ohio readers and those, indeed, in other States also will testify their appreciation of the earnest services of our late contribntor, M. B. Bateham, to the cause of horticulture and agriculture, by generously contributing to the above fund.

In view of its importance we once more inform our readers that the 18th session of the American Pomological Society will be held at Boston on September 14th, 15th and 16th. The exhibition of large collections of fruit is not desirable, but the show should be confined to new or rare varieties and remarkable specimens. Intending contributors should give immediate notice of what quantity they desire to exhibit. Three specimens of each variety will be quite enough. Packages of fruit, with the names of the contributors, may be addressed as follows:—"American Pomological Society, Boston." Freight and express charges should be prepaid. A limited number of Wilder Medals will be awarded to the objects of *special* merit. Any other desired information will be furnished by the Secretary, Mr. Robert Manning, Salem, Mass.

The era of agricultural depression in Great Britain and Ireland has borne very hard not only on tenant farmers and their laborers, but also on small land-owners. Even before the troubles began, an investment in farm lands did not bring, on an average, more than 2½ per cent., and the income from it in Great Britian is much less to-day, while in Ireland the smaller landlords can often obtain absolutely nothing from their tenants. Many of them are suffering severely and a few have been brought to absolute want owing to their inability to collect rents or to find a purchaser for their property. Among this class in England the land is being mortgaged as heavily and commonly as that of our own Western farmers a few years ago; but owing to the disturbed state of Ireland, money cannot be raised on land there except at a ruinous interest. It is expected that the number of small land-owners must soon be considerably diminished, and that the Squire's oldest son, instead of being a 'man of pleasure' while waiting for his father's shoes, must attend an agricultural college and go to work as a practical farmer or overseer.

In announcing, last week, the reported formation of a monopoly of river-transportation, we were careful to introduce each statement by such qualifying phrases as "it is said," "it is reported," inasmuch as we could hardly think it likely that so vast a transaction should have been carried on so expeditiously and quietly that the public should know nothing about it until its close. Our suspicions of the truth of the announcement are confirmed by a dispatch from St. Louis which says that the warehouse and river transportation people there think that the alleged purchase of all the barges and warehouses not controlled by the railroad companies on the Mississippi, Missouri and Ohio, is quite impracticable, as the owners of these wish to buy rather than to sell, and would have refused to break up their established business, the volume of which is as large as they can manage with the present facilities. From New Orleans we learn that there are now in the transportation of grain on the Mississippi five barge lines, employing 16 tow boats and 103 barges capable of transporting 4 865,000 bushels per month, while there are in process of construction 21 more barges which will carry up the transportation to 6,000,000 bush. a month. Very naturally the voracious pike, Monopoly, would like to swallow all the smaller fish in the rivers, but very naturally, too, some of these object to be victims to the glutton's insatiable maw.

Miscellaneous.

EMMET AND DICKINSON COUNTIES, IOWA.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

IT is not our purpose or mission in visiting different points in the West and writing of what we see to embellish our letters with the fancies of imagination, nor to present prophetic pictures of the possible future; but we aim to state facts such as are known to the intelligent yeomen of the West, such as are capable of demonstration to any who are interested; and such as many a young farmer among our Eastern readers should learn, know, and profit by. A gentleman in the East, for whom we have a warm regard and sincere respect, wrote us, after perusal of our letters from Palo Alto, and Sioux, Lyon and Osceola counties.—"Your correspondence is *all* puffs. It is too transparent to continue to interest readers. * * * The figures you present are too heavy; such statements should be within the truth." * * We know facts are stubborn things, and their inflexible corners sometimes wound the sensibilities of those who are guarding an erroneous opinion, because they have not taken the time and pains to acquaint themselves with the truth, and if our correspondent will visit those localities, he will become convinced as we have been, and doubtless, from his broad views and earnest nature he will be more of an enthusiast.

The two counties named at the head of this letter are on the Minnesota line, the third and fourth east of Dakota Territory. Their topography is undulating prairie, with not to exceed 5 per cent. of waste land, the lower lands being available for grass and pasturage, while the deep, dark, loam of alluvial cast, underlaid with yellow clay, which overlies gravel, renders the upper lands very fertile and their tillage in corn, oats, flax and root crops exceedingly profitable. Wheat, rye, barley and some other products usually do well, but are not as reliable; nor indeed is it necessary that they should be, for this is emphatically a stock country, and not a wheat-producing locality as 'tis further north. The grasses are rich and luxuriant, and corn will give an average yield of over fifty bushels per acre; concentrate these products into beef, pork and mutton, and you secure to the farmer an average profit of thirty per cent. net on his combined investment in land, improvements, stock, grain and labor. The demonstration of this to the thinking farmer, is shaping and giving direction to the investments and methods; stock interests are increasing at least fifty per cent. per annum both in quantity and quality; herds have full-blood Short-horns at their head, and the grades are steadily improving; the flocks of sheep which now number probably 7,500 head, have the best Cotswold bucks, and the hog product of the past year, estimated at $80,000, was principally Berkshire and Poland-China Stock.

From careful inquiry we have learned the fact that fleeces of wool from sheep of the same age and of the same grade, are from 1½ to 2 pounds heavier here than east of the great lakes. Will some one who knows why, please rise and explain. The explanation might remove some of the incredulity we have referred to. Much information regarding stock was obtained of Messrs. R. E. and J. W. Ridley, of Estherville, who handled the last year about 2,000 head of cattle, 1,000 sheep and $40,000 worth of hogs. We give their address and our authority so that those interested may know of whom to seek information.

Land can be bought from $4.50 to $8 per acre; it can be broken for $2 25, the sod be sown to flax, three pecks to the acre for $1; harvesting and thrashing per acre cost $2 52; and the yield is from seven to ten bushels, worth $1 per bushel. The land is cross-plowed in the Fall, and in the Spring either seeded down to domestic grasses or planted to corn. Farms range in price from $7 to $12 per acre, according to improvements, proximity to railroads, etc. There are over two dozen lakes, with good banks and plenteously stocked with fish. The Little Sioux River in Dickinson County and the east and west branches of the Des Moines in Emmet flow through it, the east fork heading within its limits. There are also four good-sized creeks, two or three lake outlets, and many springs of pure, living water, while wells of excellent quality are obtained at an average depth of 25 feet.

OKOBOJI AND SPIRIT LAKES deserve more than a passing notice, and in their *tout ensemble* would set at naught the descriptive powers of a more gifted pen than ours. The first of these is divided into two by a kind of strait (though passable for boats), and the two parts are known as East Okoboji and West Okoboji. The water is deep and clear, much of the bottom and shores is covered with sand and gravel, the latter in some places so uniform in size, clean and presenting such a variety of colors as to possess marvelous beauty; the shores and banks are high, well defined and mostly covered with bodies of fine timber, except here and there, where a well tilled farm runs down to the beach, while some near-by eminence bears the residence and barns of a thrifty farmer. The two lakes have nearly 32 miles of shore line, and a succession of beautiful landscapes. M. J. Smith has built a commodious residence in an attractive locality, on the bank of the lake, and his home-like hospitalities are in constant requisition by guests from hundreds of miles away, while near-by, at the shore, are Messrs. Mills Brothers, courteous, attentive and obliging, with boats, fishing tackle, bait, etc., as desired. Spirit Lake is much like the descriptions already given for the Okobojis; it is almost five miles wide, and over six miles long, its northern extremity reaching to the Minnesota line. Its bottom, shores, banks and bordering beauties are the peers of its twin sisters to the South. On the Southern bank is a State fish hatchery, and from Mr. A. A. Mosher, Assistant Fish Commissioner of the State, who resides in the town of Spirit Lake, near-by, we learned, that of California Salmon, Mackinaw Trout and other varieties he had put into the Okobojis this season, 450,000, and into Spirit Lake 250,000, making 700,000 imported fish, beside the abundant supply of pike, pickerel, bass, etc., found naturally in them all. At the north end of Spirit Lake is "Hunter's Lodge," an extensive establishment kept by Mr. O. Crandall, for sportsmen and their families. We only halted there an hour, but his guests were loud in their praises of table, and accommodations. Mr. C. keeps a fine array of boats, tackle, etc.

On the southwest shore is another large building in process of completion, with every convenience for hunting and fishing at hand, known as "Lillywhite Lodge." This fronts a beautiful gravel beach.

There is a liberal growth of natural timber along the rivers, creeks and chain of lakes, with numerous artificial groves of trees scattered through the country. The growth of these counties has been retarded, and their gaming and pleasure resorts measurably neglected because there was no railroad in either county, but at this time the builders of the Pacific Division of the Burlington Cedar Rapids and Northern railway are busily at work extending their line from Clarion in Wright County, *via* Emmetsburg, to Estherville and Spirit Lake. The Company (C. J. Ives Sup't.) being progressive and enterprising, will give new life to this section. They expect also the Des Moines and Northwestern Narrow-guage Railway to come north *via* Milford, a thriving little place four miles south of Okoboji, about which W. F. Carlton will answer inquiries.

We were told that great benefit was anticipated from an investment by the

Scottish-American Land Co.,

in Emmet County. This consists in the purchase of over 40,000, acres which through the capital and influence of this corporation (incorporated jointly by Iowa and Great Britain), will be improved rapidly and permanently. They sell for actual settlement only, at low prices, and on favorable terms, loaning the settler money, if necessary, at six per cent. interest, in amounts equal to half, two-thirds, or three-fourths of the cost of his improvements. A purchaser of a quarter-section (160 acres) can be furnished by them with ten heifers, two and three-years-old, and a thoroughbred Short-horn bull for four years, he returning then the orginal stock and half the increase as the only remuneration to the company. When desired they furnish the land, pay in cash $2 per acre for breaking, furnish seed for sowing to flax on the sod, pay half the thrashing bill and divide equally with the renter, or, as they are constantly opening and improving farms, they will, if preferred, rent for cash or on shares to desirable tenants. Alex. Peddle Esq., is the land Commissioner and attorney of the company, their only representative in the United States, and he gives personal and special attention to the interests of his colonists, gratuitously. His address is Emmetsburg, Palo Alto County, Iowa. The property valuations, real and personal of both counties are about $1,250,000 which are assessed upon a third of the actual values, the tax averaging three and one-quarter cents, all included.

ESTHERVILLE is the oldest town in, and the former county seat of, Emmet County. It is situated on a plateau encircled on the south and west by the Des Moines River, and the tree-clad hills beyond. It can boast of a pretty site and surroundings; two religious societies and one church edifice, a good school with two departments, a live newspaper, the Vindicator, by Frank Davey; a population last census of 225, now probably over 300; a railroad building in and out of the town; numerous new buildings under construction; a brisk business and enterprising lot of citizens, and a promising future. The Defiance Creamery was started last March by C. T. Simpson on the cream-gathering plan; capacity, 1,000 pounds daily; present average 225, soon to be increased to 500 pounds *per diem*. At present it is using the milk from 300 cows and will soon use that from 600. The milk is gathered by two teams from a radius of fourteen miles; it churns by horse-power, uses the Davis and Fairlamb patent cans. It pays for cream on the basis of the price of creamery butter in the market, and ships to New York and Boston. It has plenty of ice and the business promises fairly. Dr. E. H. Ballard came here years ago, has established a large practice, and now, having become a member of the mercantile firm of Ballard & Barker, wants to retire from his professional life. This makes an excellent opening for a physician. There are also needed a hardware store and a harness maker. As soon as the railroad is completed many other things will be needed. 'Tis a good point for business. We received valuable assistance from Howard Graves (banker and dealer in real estate) Soper & Allen (attorneys and real estate dealers), Knuet Espeset (county treasurer and real estate agent), Frank Davey (editor, auditor and dealer in real estate), and J. W. Ridley (proprietor of the Emmet House); address any of these gentlemen (with stamp inclosed) for information and it will be promptly and cheerfully forthcoming. Mr. Espeset will answer correspondence in either American or Norwegian.

SWAN LAKE, the present county seat, is a prairie town on an elevated site about half a mile north of the lake of the same name—a body of water about three-quarters of a mile by seven miles. The town has a wide awake population of less than 100, a church, a district school, a G. T. lodge, and three good stores. A company recently organized are starting the Emmet County Creamery. They will commence with from 300 to 400 pounds daily, though having capacity for 1,000 pounds. They will gather from about 600 cows and churn by horse power. C. W. Jarvis, Esq., of the Emmet County Bank, placed us under many obligations, and merits our thanks. He is also dealing in real estate, and would be a desirable correspondent for information.

SPIRIT LAKE, the county seat of Dickinson County, commands a pretty site, elevated, undulating and fringed with a natural growth of trees. It stands at the south end of Spirit Lake, but lying more immediately upon the western bank of East Okoboji Lake. It has a good school of two departments, with two teachers; three religious societies, with two church edifices; A. F. & A. M. and I. O. O. F. civic societies; good hotels for the accommodation of guests, sportsmen and pleasure seekers coming to the lakes. The Spirit Lake Beacon, by A. B. Funk, and the Spirit Lake News are two of the newsiest papers in Northern Iowa. With good stocks of merchandise, a live business, wide streets and sound sidewalks, this is a brisk, bright, promising little town of about 400 population. They need a nursery for raising fruits, shrubs, etc., a creamery, and other industries not now represented. At this point we were the recipients of attentions and assistance from J. A. Smith (land agency), Rice & Rice (attorneys and real estate agents), and Messrs. Osborne and Perrin (respectively the Treasurer and Recorder of the county, and real estate agents), and they consent to answer any correspondence, covered by return postage.

Literary Miscellany.

THE PRESIDENT'S CHANCE.

"WE'LL take that chance," though it may be small,
The eye that noteth the sparrow's fall,
Is over me, and I shall arise
If knowing all, He shall deem it wise.

Honor and trust by a nation given,
Shall nerve my will, by the help of Heaven;
The prayers of love shall not rise in vain,
If courage and faith may but conquer pain.

So I will not fear but calmly lay
My hand in the one, outstretched alway,
For help of the bruised but striving one,
And so shall I live 'till my task is done,

Strong is my heart, and knows no fear,
Though prone and helpless I find me here,
Who an hour ago, with life's hopes high,
Stood under the light of the morning sky.

I will take the chance and hold me still,
Waiting in patience the Sovereign will,
That suffered for ends *I* may not know,
To fall unhindered the cruel blow.

He had taken always the chance that lay,
In the narrow passes, along his way,
From an orphaned childhood poor and lone,
Steadily up to a people's throne.

Had taken the chance to store his mind,
With wealth of science and art combined,
To lay in his youth foundation sure,
For the coming manhood strong and pure.

Had taken the offered chance of Heaven,
That to all is in love and mercy given,
To save his soul from the death of sin,
And gather the fruits of virtue in.

And now in the strength of manhood's hour,
From his proud position of peace and power,
In a moment hurled by a dastard hand,
While horror of darkness filled the land,

He said with strong and resolute will,
"I will take the chance" that is left me still;
Struggle for life may be sore and long,
But God is good and my heart is strong,

—MRS. EMILY J. BUGBEE, in Cleveland Herald.

THE MANOR HOUSE.

Continued from page 506.

I did not waste time in thinking. The whole thing might be a mere trick, and I was resolved not to allow myself to be easily deceived. I made all haste into the central court, and, candle in hand, made a close and searching investigation of the place. The light burnt without flickering in the still September air, and illuminated a large area around me as I moved about. But I could see nothing unusual. All was perfectly quiet. There was no one in the court; no one at least of earthly, ordinary mould—for the notion that I was not really and entirely alone had somehow gradually taken possession of me, and it was not without a quickened pulse and a slight tension of the heart strings that I re-entered the passage and made for my own room upstairs. As I passed along I still had the feeling that something else—I could hardly call it some person, for the companionship was of the vague impalpable kind which argued no bodily form or existence—was near me all the time. I seemed too, as I got to the foot of the staircase, to hear a light pattering of feet upon the oaken floor, and the gentle closing of a not very distant door.

On reaching my bed room I locked and bolted the door as usual, and, setting down my lamp, sought to recover my somewhat shattered self-possession. This was an entirely new and unexpected line of attack. It was to my mind, far more weird and ghostly than the other, and I was proportionally the more disturbed. That face with its quaint dress—these eyes—where had I seen them before? I sat thinking, thinking, with my ears on the stretch for any fresh, unusual, disturbing sounds, and wondering what strange events the coming night would produce. But the house was quiet and silent as death; so it continued till long after midnight. After watching intently till well on in the small hours, worn out but still somewhat dazed and confused, I turned into bed and was soon sound asleep.

I slept late next day, and the old gardener remarked upon it, as I thought a little pointedly. Did he know more than he chose to tell? I questioned him closely, as I had often done before. My efforts were just as fruitless. He positively denied that he or any one he knew of had come to the house after ten that night. Why did I ask, had I been disturbed? I would not tell him all, but I described the quaint head-dress which encircled the face I had seen, and I asked him if he knew of anything like it anywhere.

"Why, master, it's jist that that the Lady wears; you've seen in her picture—in the great banqueting hall."

And then I understood why it was that those eyes of the night previous still haunted me with their malevolent gaze.

"Has her ladyship the character of being at all uneasy in her grave?" I next asked, in as flippant, off-hand a tone as I could assume. "Is she supposed to walk about this house at night?"

"You don't say you've seen Her, master? Her?", and the old man clutched my arm convulsively, looking into my face with a mixture of horror and incredulity which considerably impressed me.

"I think so; last night about half-past ten."

"Dear, dear, dear! I warned you not to be too cock-sure that you'd done with the ghosts. Oh, master, for the love of Heaven be careful. Don't stay in the house, don't; or if you must, keep to yourself. Don't follow her, don't meet her, don't thwart or anger her, or—" He did not finish, but shambled hurriedly off, leaving me a prey to mixed and slightly uncomfortable emotions.

The lady was much in my thoughts the remainder of the day. Would she show herself again at night? I did not wait to be startled, but as soon as the Dukes left the place, which they did as usual at my particular request, I patrolled the centre courtyard for a couple of hours, walking in the dark, but having a match-box handy and a candle end in my pocket. But nothing appeared, and about eleven I went upstairs to bed. Nor was I disturbed again that night. Next morning the first disagreeable impression was already fast fading away, and I began to think that my fears had been the father of my vision, and that I had never really seen any lady at all.

But now came another phase of the mystery. Artist-like, I am devoted to flowers. Old Duke humored me willingly in this, and kept my room well supplied. The evening before, he had brought me an unusually fine bouquet of late roses, which I had myself arranged in an old-fashioned vase and placed on a table of my sitting room. These roses had been one of the last things I had looked at and handled before going up to bed the night before. When I came down stairs I missed the flowers. Had old Duke come in and removed them? I called out for the old man. He was not in the kitchen nor yet was his wife. Inwardly cursing him for moving the roses, I went out to see where he had put them. I hunted through several rooms, and discovered them at last in a little boudoir adjoining the state chamber.

"Fussy old fellow!" I said to myself as I carried them down stairs, "why can't he leave things alone?" and I repeated the remark to him directly he came in.

"I never touched the flowers," he replied, in an injured, surly tone. "This is the first time I've been to the house this morning."

"Then your wife did."

"She's down with the rheumatis, and can't come over."

"Who did, then?" I asked sharply.

"Ah! who knows? But you must expect to find more things moved than that—aye, and worse too—now that She is at her pranks again, and trapesing up and down this house."

There was truth in what the old man said. It seemed now as if some especially malicious and mischievous spirit were resolved to worry and annoy me. I seldom found things of a morning as I had left them in the sitting room the night before. Now it was my easel, now my painting apparatus; on another occasion I found all the books of the library scattered about the floor. I bore these small vexations stoically for some time. They did not disturb me greatly, as throughout I was never personally visited and annoyed. But at last, as if to goad me to desperation, my tormentor took to interfering with my work. I was in the habit of often leaving my canvasses fastened together just as I brought them in from nature. I now frequently found them undone, and hidden in out-of-the-way corners. In some instances the color was still wet, and had been considerably smudged. Had this been all, I might still have borne my troubles with patience. But when ghostly hands presumed to use my own palette and brushes to paint upon my own work, I felt that it was nearly time for me to leave Maxted Manor. Yet this actually happened. One night I had left a carefully executed sketch of the great gateway, seen from within, on my easel, and next morning I found a figure—a shadowy female figure in white—interpolated in the attitude of passing out on to the bridge. The figure was not badly painted, be it understood, but it was unnaturally large, and its introduction gave the picture a weird, uncanny effect. Next day another sketch, of the exterior of the house from the lawn, had been similarly tampered with. The same white figure had been introduced, with the same contempt of proportion, and with the same bold, flowing handling of the brush.

I confess that by this time my feeling was one of exasperation rather than of terror. I began to think that it was time either to unravel this last mystery, or remove entirely from the annoyance which I endured. Only I did not like to beat too hasty a retreat. It would savor of cowardice, and I was no more a prey to this now than before. I determined before I left the place to make another effort to get at the bottom of the thing. Perhaps I might end this as I had already done the mystery of the moat. At least I would watch for a night or two, and try and trace back effects to their cause.

The next night, before retiring to my bed room I first made a careful examination of the central court, as I generally did, and with the same negative results. I then entered and locked carefully

through all the rooms on the ground floor; I tried all doors and windows in them, as well as those in the corridor or passage. I did the same on the first floor. After that I entered my bed room, set down the light, and went through the form of locking the door. But I unlocked it in one and the same moment, and left the door a little ajar. Next I put on a pair of list slippers. Then I sat down for half an hour, to wait till my enemy was established upon the theater of her nightly operations.

About midnight, I crept stealthily out into the corridor. I carried no light, and it was pitch dark, but by this time I know every inch of my road. I reached the top of the staircase, passed down the steps into the corridor on the ground floor, and so towards the sitting room I always used. More than once I stopped and listened. The house was absolutely still and quiet. Stay, what was that?—the rustle of a silken robe? No: only the sighing of the wind among the distant trees. Again I stopped and listened. I fancied I heard rustling and crackling, as of papers opened and unfolded: but, although I held my breath in my eagerness to listen, I found myself mistaken again. But now I was abreast of the sitting room, and once more I paused. It was here that all the mischief had been perpetrated, and this was the spot I especially desired to observe. I stood in front of the door for fifteen minutes, as keenly alert as a hare on its form. But the stillness of the night was unbroken. I could not detect the slightest movement inside. Indeed, I had all but made up my mind to enter the room and finally set all my doubts at rest, when I became suddenly aware that it was really occupied after all. I never quite understood how this conclusion was borne in upon me. But I know that I heard footsteps within; more than once I detected a slight "hem;" last of all there was the unmistakable grating of a chair as it was pushed across the solid oaken floor.

My object now was to turn the door handle gently and peer, unobserved if possible, into the room. It was my only way of ascertaining whether anyone, and if so, what kind of person, was there. I might have been a professional burglar, I did the trick so cleverly. I got the door opened quite artistically. There was not a rattle or a creak; everything seemed to play into my hands. Presently there was room for me to get my head through—and I looked in.

What I saw was not unexpected, yet it startled me considerably. A tall female figure in white was seated at my easel, leaning over and painting busily. I was spell-bound for the moment, and could neither go backward nor forward.

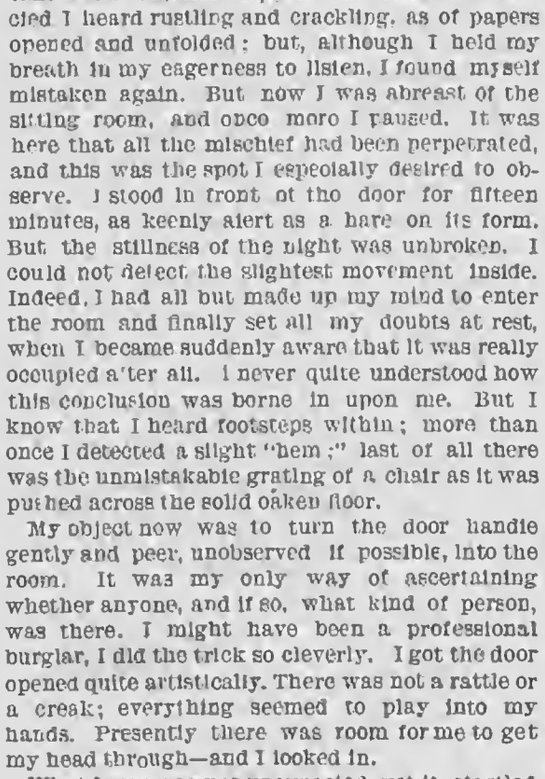

FIG. 398.

How long I should have remained thus it is impossible to imagine. But after a few minutes, perhaps under that strange mesmeric influence which conveys to all of us the impression that we are being watched, the female raised her head suddenly and looked round. The face was the same which I had seen through the window in the court—the same which I knew by heart by the portrait in the great hall.

She did not give me long to observe her, however. The moment our eyes met—how well I remembered those great wild brown eyes!—she rose to her feet with a startled exclamation, and glided rapidly away. It was a strange but not unearthly shout; on the contrary, it had a distinctly human intonation, and was not without a tinge of mockery and laughter. I rushed into the room and gave chase. All of the doors of the rooms *en suite* were open—had they been left so purposely?—and the figure on passing through the first banged it behind her. This gave her the advantage, and increased the distance between us. It was the same with the next door, and the next: still I was close behind her and might eventually have overtaken her had the race been a little longer. But the last door was that into the turret with its winding stairs. This she also banged behind her and I distinctly heard the bolts shot in the lock, accompanied by another sound, that of suppressed laughter.

She was gone. I struck a light, then tried the door, shook it repeatedly, but it withstood all my efforts. I knew that I had failed, yet I was not dissatisfied with my adventure. At least I had driven my tormentor off the field, even if she had left no trace behind her.

No trace? There I was mistaken. The ghost, or whatever she might be, in her hurried exit had lost one of her shoes, and there it lay just where she had disappeared—a pretty, dainty, artistically made high-heeled shoe.

I took it up and examined it closely by the candle light. It might have been the property of some supernatural personage, but it gave me a very distinct impression that it had just fallen from a human foot. There was nothing shadowy or unsubstantial about it; it was made of good honest purple kid, adorned with a fresh rosetto of crimson ribbon and lined with soft pink silk. That I held in my hand a clue, however, to the mystery of Maxted Manor, I was more and more convinced as I turned over and inspected my high heeled shoe.

It was not till I had carried the shoe upstairs to my own room and had made a second inspection, that I discovered names and a number stamped upon the sole. The names were somewhat blurred but I made out at length to read them with the numbers 379,063.

The names, of course, were those of the makers, the number that of the customer's last. I surely might ascertain from the shoemakers whether this customer was a denizen of this or another world. Full of this idea I telegraphed to a friend to make the necessary inquiry, leaving word at the telegraph office to send me over any message that might arrive.

My road back to the Manor House led me past the gardener's cottage. As I passed, it occured to me that I might perhaps extract something from old Duke, and I paused in front of his door. As I did so, I caught sight of a face at the window upstairs—the face of a young girl, as I thought—but the moment I looked up it disappeared. Duke was not in, nor was his wife seemingly, I called to them both, but no one replied. I was turning to leave the cottage, when I heard the heavy clattering footsteps descending the stair. I waited, and presently a young woman entered the kitchen parlor, and walked straight up to me.

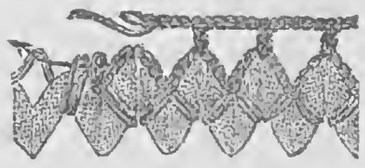

FIG. 399.

In spite of the heavy brogues which I had heard and now saw, I was fairly taken back, for I did not remember to have ever met a prettier girl. She was tall and shapely, and had a noble, a strikingly noble and handsome face, with bright curls rippling over a sunny brow, and large brown eyes full of expression. There was breeding in every feature A lady surely, although so quietly not to say shabbily, dressed. But the plain drab frock of dark home-spun fitted her figure perfectly, and the pink ribbons in her hair and at her throat, if faded, were yet arranged with the taste that argued a cultured mind.

"Pardon, me," I began, raising my hat. "I had no idea——"

Then she spoke, and all poetry, all sentiment, vanished.

"What's your wull?" she said in the sweetest voice, marred by the most atrocious northern burr; "Oi canna help ye, can oi?"

"I was looking for old Duke."

"Oncle's out; so's aunt. What's your wull?"

"How is it I have never seen you before? Do you always stay here with the Dukes?" I felt rather disposed to hold her in conversation.

"Na; I'm only biding for a wee. O'im soon ganging whoam." She stooped, and, looking me full in the face for a moment, said abruptly, "And you'd better be ganging too. You mayn't bide here."

"Well, perhaps you're right; tell your uncle I'll call again. I want to speak to him about something I picked up in the Manor House last night—a shoe."

"I'll tell him. A shoe, eh? What like? would it fit me?" she said, sticking out a foot which seemed enormous in a coarsely-made heavy hob-nailed boot.

"Hardly, unless——"

Somehow I had my suspicions about this girl. Her accent did not sound quite true; I thought it varied. She had a ring on one finger. These boots were too obviously ill-fitting. What if they had been assumed as a disguise? As these thoughts passed rapidly through my brain I kept my eyes on hers, struck no less by their beauty than by their resemblance to another pair I had seen only the night before.

It was she who put an end to the pause by once more saying, "You'd better be ganging," and pointing with her thumb to the door. Of course I could not well stay at the cottage, and I could not well tax her with having been a party to the annoyance I had endured at the Manor House—not, at least, without more evidence than I had just then. So I said good-bye civilly, and turned on my heel.

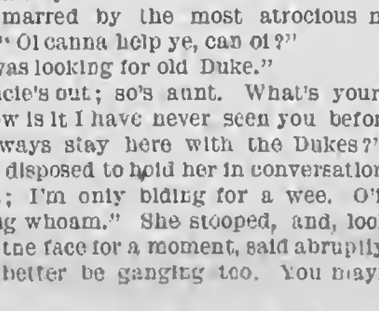

FIG. 400.

Just outside the house I encountered the telegraph boy on a pony. He had just trotted over with my answer. I tore open the yellow envelope and read:—

"Have seen shoemakers; no difficulty. Three hundred and seventy-nine thousand six hundred and sixty-three, number of Miss Judith Maxted's last."

I knew it! It was the fair owner herself who, from a mischievous desire to try my courage, had been haunting the house. More, it was she herself whom I had just seen in the cottage.

I hurried back, and, without knocking, hastily lifted the latch and walked in.

"Who's that? How dare you come in here?" The voice was the same, but the accent was gone and I saw my young friend trying hard to conceal something which she held in her left hand.

"I beg your pardon, but I came to restore something to its owner," and I produced the shoe. "You have its fellow there in your left hand. Allow me to present you with your property, Miss Maxted."

She started. "I'm not Miss Maxted. My name's Barbara Duke. What do you mean?"

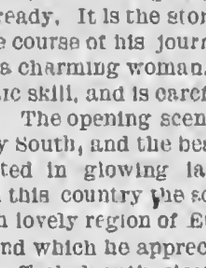

FIG. 401.

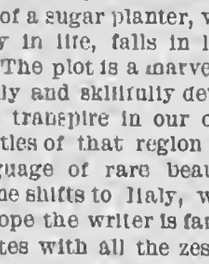

FIG. 402.

"I mean that I've found out the whole trick. You have been too hard on me. Now, of course, I shall leave the house."

"No, no," she said. "It was only a foolish escapade. I am extremely grateful to you for having put an end to the ghosts in the state chamber, and now I will go away myself, and you will be troubled no more."

To make a brief conclusion to this long tale, I may say at once that she did leave Maxted Manor that evening. I stayed on till the end of October. But that Winter I renewed my acquaintance with her under pleasanter auspices, and the following Summer we returned to the Manor House in a new relationship.

NEW PUBLICATIONS.

The Earl of Mayfield, by Thomas P. May. Philadelphia: T. B. Peterson & Brothers. Paper Cover, Price 75 Cents.

The Earl of Mayfield has achieved great popularity, seven editions of the book have been exhausted, and the eighth, revised by the author, is now ready. It is the story of a sugar planter, who in the course of his journey in life, falls in love with a charming woman. The plot is a marvel of artistic skill, and is carefully and skillfully developed. The opening scenes transpire in our own sunny South, and the beauties of that region are depicted in glowing language of rare beauty. From this country the scene shifts to Italy, with which lovely region of Europe the writer is familiar, and which he appreciates with all the zest of an unaffected, enthusiastic lover of nature. The events in the closing chapters transpire in England, and an English home is described with peculiar beauty.

The Twin Cousins. By SOPHIE MAY, Boston; Lee & Shepard, Publishers.

The mere mention of the authoress's name, doubtless, is sufficient to excite an interest in this one of her many well written and appropriate books for children. Indeed, those of older growth who appreciate childish interest, will not feel time wholly lost by a perusal. Flaxie Frizzle the heroine is of that family of little girls that uses the expressive "orful." Auntie Prim in giving permission for a party to Flaxie and her cousin, gave the instructions for invitations, adding, with a sigh, "And I shall be thankful when it is over." The youthful hearer did not forget a word, but

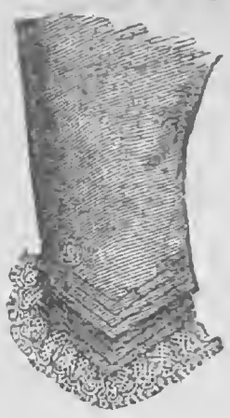

FIG. 403.

repeated the unintentional addition much to the chagrin of the old lady. Many are the adventures related of waywardness; lovableness also is depicted, showing child life as it really is.

Drugs That Enslave. The Opium, Morphine, Chloral and Hashish Habits. By H. H. KANE, M. D., Philadelphia; Presley Blakiston. Price $1.50.

This work is calculated to be of great benefit if properly appreciated. As a preventive influence it will, no doubt, be most beneficial, as it is much easier to abstain when free from a habit than to correct one already formed. A few of the introductory words will suffice to show the importance of a well written exposition of facts and needed revelations. "A curse that is daily spreading, that is daily rejoicing in an increased number of victims, that entangles in its hideous meshes such great men as Coleridge, De Quincy, William Blair, Robert Hall, John Randolph, and William Wilberforce, besides thousands of others whose vice is unknown, should demand of us a searching and scientific examination. Imports of opium into the United States for ten fiscal years, ending June 30th:—

1871,	315,121 lbs.	$1,926 915
1872,	416 864 "	2,107 341
1873,	319.134 "	1,978,502
1874,	395 909 "	2,540,228
1875,	132 541 "	939 553
1876,	389 311 "	1,805,906
1877,	349.223 "	1,788.347
1878,	434,950 "	1,874.815
1879,	405,957 "	1.8 9 696
1880.	533,451 "	2,786,606

Either the compilor of the given table or the type setter has committed an error. According to the Treasury Statistical Report, the importation in 1875 was 305,186 lbs; value $2,037,792.

Motherhood. A Poem, Boston; Lee & Shepard. Price, $1.50.

The authoress has chosen to keep in obscurity in connection with this production. Fear of depreciation, however, need not have prompted her, for while humanity as a mass may treat it with indifference, those who have experienced maternal relations and others who are sensitive to the purifying influence of childhood, and are filled with love for the dependent innocents, will enjoy its sentiments and properly estimate its value.

The French Revolution. A History. By THOMAS CARLYLE. New York: American Book Exchange Publishers.

This is a reproduction of a standard work the subject matter of which would require a lengthy review to make it comprehensible; this we forego on account of limited space. The book is well gotten up: strongly and prettily bound. The print is clear—a feature above all to be commended. The only inferior part is the paper, and that is not objectionably poor. Cheapness in a financial sense serves to recommend it to the public.

For Women.

CONDUCTED BY MISS RAY CLARK.

DESCRIPTION OF CUTS.

FIG. 398.—CROCHET LACE FOR COUNTERPANE.

Begin in the narrowest part between each point; make a chain of thirty-two stitches, and one to turn with.

1st. Row: One double into each stitch.

FIG. 404.

2nd Row: One chain to turn, one chain into each of sixteen successive stitches, four chain, pass over four stitches, one double into each of four next successive stitches, four chain, pass over four stitches, one double into each of four next successive stitches, four chain, one to turn.

3rd Row: Same as first row.

4th Row: One chain to turn, one double into each of twelve stitches, four chains, pass over four stitches, one double into each of four next stitches, four chain, pass over four stitches, one double into each of four next successive stitches, four chain, pass over four stitches, one double into each of four next stitches; four chain, and one to turn with.

5th Row: Same as third row.

6th Row: One chain to turn, one double into each of eight next stitches, * four chain, pass over four stitches, one double into each of four next stitches; repeat from * three times more, four chain, and one to turn with.

7th Row: Same as fifth row.

8th Row: One stitch to turn, one double into each of four next stitches, * four chain, pass over four stitches, one double into each of four next stitches, continue this until row is finished. Repeat the directions for continuing the pattern.

FIG. 403.—DESIGN: MORESQUE EMBROIDERY.

This design is suitable for a variety of purposes; it may be used to ornament cravat ends, sachets, drape for work baskets. The outline of the pattern must be traced on silk and worked over with rather open buttonhole stitch in embroidery silk, leaving loops at regular intervals. A row of chain-stitch is worked inside the buttonhole stitch. When it is finished the work is to be cut away with a sharp pair of scissors.

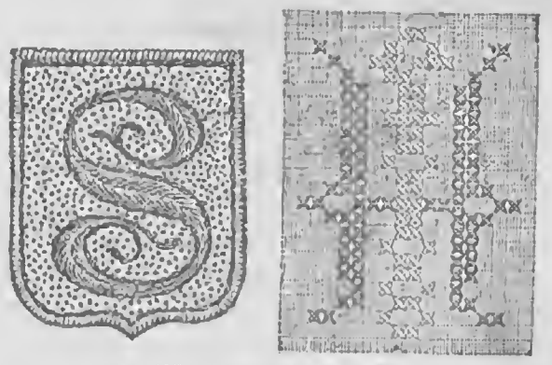

FIG. 405.—INITIALS FOR MARKING.

FIG. 404—DESIGN FOR SLEEVE.

FIG. 400.—DESIGN FOR TRIMMING OF INFANTS CLOTHING, ETC., IN EMBROIDERED BRAID OR CANVAS AND CROCHET.

FIGS. 401 AND 402.—CROSS AND ITALIAN STITCH DESIGNS.

These designs are suitable to be worked in the corners of dollys, serviettes, etc., or they may be repeated to form borders.

FIG. 399.—EDGING: CROCHET AND WAVED BRAID.

1st Row: Work a double under the braid between the scallops (see design), three chain, one double into the point of braid, three chain, one double under the braid (see design). Repeat from the beginning of the row.

2nd Row: One treble into a point of braid, four chain. Repeat from the beginning of the row.

THE GIRLS AGAIN.

MUCH has been written and said about the bringing up of the girls; so much that it would seem as if every mother must have heard or read enough on the subject to awaken her to a full realization of the arguments and the wisdom of the suggestions; but yet every day we see homes where it is evident that either the voice of the reformer has not been heard or the newspaper containing this gospel for mothers and daughters, has not strayed or that those concerned have not taken it in sufficiently to heed and resolve to put it into practice.

The subject has been dealt with by the best thinkers of the day on every side, physical, moral intellectual; from infancy to maturity; from heredity to higher education. That the young women of this country are not the very perfection of womanhood is not the fault of the pioneers in this movement of philanthropic progress.

I have nothing new to offer, nothing new to consider, but the old topic of the slavish mother and the incapable young-lady daughter has lately come to my notice practically illustrated to such an extent that, in a state of acute exasperation, I have taken my pen to-night to have my little say about it.

Many a good mother, looking back over the long road of the past, and remembering the rough, hard places, and gazing at her horny hands resolves that her daughter shall have a better time. That is good and right; but too often she carries it too far, and the girl who might have become a kind, thoughtful, efficient woman, she renders selfish, indolent and dependent by waiting on her unduly and teaching her to expect to do little or nothing for others, while all must deny themselves for her sake.

The mother to whom I referred just now is no longer strong and Miss Jenny is a healthy young woman of twenty-two. Yet the mother does all the housework including the sewing and mending for her daughter. The latter makes tatting and edging for her underclothing, and tidies and mats and rugs innumerable, and plays very fairly on the piano, which has been squeezed in somewhere, for the family is anything but rich. The mother goes without a new bonnet and fixes her dress over and over, in order that Jenny may appear as well dressed as the other girls of her set. When company comes, Jenny entertains them and her mother goes on with her work in the kitchen. She waits on the table and if anything is wanted during the meal, Jenny never rises to get it, but passes the empty dish to her mother for replenishment and adjusts her pretty wristlets in happy ignorance of the thoughts of those looking on.

Now this is all wrong. This girl is not naturally bad; her mother, is solely to blame. Instead of making her more attractive in the eyes of the world, she has taught her to treat her parent as a servant, and has caused strangers to regard her as an undutiful, selfish, indolent child.

I for one, do not believe in the plan of wearing the oldest out first. Let the younger ones have a good time, spare them the rough sides as much as possible without conflicting with duty and right development; don't be so strict as our ancestors were with their families, who had to walk a chalk line from their very cradles to manhood and womanhood, but, parents, have some respect for yourselves and for your own rights or your children will doubtless have none for you. R. B.

LABOR.

THERE never has been a doubt in my mind but that labor was a curse, as it was intended to be. "By the sweat of thy brow thou shalt earn thy bread." The normal condition of childhood and youth is idleness or unproductive activity. A boy will build snow houses, or pile stones for a mock fort, or sit upon a bridge patiently fishing all day, but put a shovel in his hands to clear the snow from the path from the house to the gate, or set him to throwing the stones on to a boat, or to watching the cattle with an ox goad in his hand, and you will have a pitifully tired boy at night, and a wronged and abused one.

Let that boy get the idea that his father ought to support him, and his mother work for him, and he is on the broad road to loaferism.

The natural heart is not to be trusted to guide into paths of industry and usefulness. Every hour of play should be earned as soon as the child is old enough to know how to pick up his scattered playthings, and put away his shoes and stockings, and put on his own "nightie" when the birds and babies alike seek their nests.

There is nothing should be taught sooner than that this is a working world, and that labor, physical or mental, is a necessity for the whole progeny of the first tiller of the ground and sower of the fig leaves.

I find that mothers try to spare their daughters the necessity of labor (by taking the burden on themselves) much more than fathers do their sons. In fact, my experience is that men, as a rule, are lazier than women. The boys are made to work and earn for their fathers before the mothers think the girls can do more than to hem their ruffles or trim their hats. Mothers take pride in their daughters' soft hands and round cheeks when their own hands have become hardened, their own cheeks hollow. The danger of this is that the soft hands and smooth faces become the first thought of the daughters, and a selfish and idle life is the result. Daughters, you will have but one mother—care for her and spare her. "No love like mothers' love," unselfish, thoughtful, unreasoning often for herself, but always taking thought for "the children."

An idle life is always a selfish one. No heart is so naturally good as to escape the demoralizing effects of days without labor, that bring nights without weariness. I know this is all old, trite and has been said thousands of times much better, but I see so much of trying to shirk the curse of labor among the young people of the day that it will not hurt to say it again. O. W. P.

FOOD TAKING.

"ALL the world and the rest of mankind," to use the expression of a great American statesman, claim to believe it to be very unhealthy and highly improper to retire for the night soon after a full meal. Many persons feel compelled to go to bed hungry when obliged to wait supper till bed time, and many at such times eat, if at all, but sparingly, and that under a protest, through fear of bad dreams, nightmare, spooks and incubuses. I have no doubt that such unhappy events often occur after eating a full meal near the time of retiring, especially if of tempting dishes and out of the usual time that has been established by habit. But is it really true that sleep is more perfect and refreshing, the body more perfectly invigorated, by sleeping on an empty stomach than on one moderately filled, and the appetite satisfied? or is it true that digestion and assimilation are more perfect if performed during working hours than if performed during sleep? or are these unpleasant feelings during sleep after a full meal simply the effect of breaking over a long fixed habit? Let us reason this matter, for during the whole historic period more or less of popular opinions have in the course of time been proven to be but popular errors. Experiments are recorded of dogs of the same age, size and breed, fed alike, one put on the chase at once and the other left at rest. After a stated time the food upon the hunter was found scarcely affected, while in the other it was fully digested. All our domestic animals lie down and rest after their appetites are satisfied. Beasts and birds of prey are almost incapable of action during the digestion of the contents of a gorged stomach. Experienced teamsters learn to give their animals their fullest feed at night after their labor for the day is finished, and in all the brute world, so far as we are able to observe, their natural habit of digestion induces rest and sleep.

But says my lady friend of a dyspeptic diathesis "they are but brutes," admitted, but they don't have dyspepsia, neither do I admit that we can learn nothing of benefit to ourselves from the natural habits of brutes; were it so the many innocents, dogs, cats and hares that have been sacrificed to science by the surgeons scalpel, have been made martyrs in vain. But let us refer to the animals of our own species, man as near as we can find him following his own natural instincts. The Indian hunter gorges himself and lies down to sleep when he has slain his prey. The overland travelers across the plains eat their principal meal when camped for the night. Soldiers on the march do the same. Explorers and surveyors follow suit; and our grandfathers and grandmothers when relieved from the cares and labors of life are very apt to take a nap after dinner. Your own physician if he is orthodox, tells you, it is better to rest after a full dinner and your lawyer who labors with mind and brain to defend your cause will eat but lightly at the dinner recess, and make it up when the trial is over or adjourned for the night.

But let us reason further, physiologists tell us that while any portion of the body, whether brain or muscle is in full exercise, there the blood flows in excess of what is wanted during rest, for the support of the organ in use, and to repair its waste.

Man retires at night with his stomach moderately filled his appetite satisfied his mind relieved from the cares and labors of the day; he falls to sleep, his brain and muscle are at rest, his lungs are inhaled less frequently his diaphragm more sluggish his pulse beats slower, for his spare blood has gone to the assistance of his stomach, for the involuntary muscles of it are at work, his sleep is tranquil, and if he has dreams they are of a pleasant nature, for Nature has had her own way, and the man is all right. S. B. P.

TAKE LIFE CHEERFULLY.

THERE are great numbers of people of both sexes who live in a continual atmosphere of delight in being unhappy; they seem to see everything through a jaundiced or otherwise diseased vision; they judge, weigh and measure everything in proportion as it has bearing upon their peculiarly morbid state of feeling.

The man will never have done grumbling and mourning over the loss of some trifle, and will neglect many more times its value in some parts of his business, apparently for the delight in nursing the recollection of a loss, or an injury.

Wholesome, timely regret is good; is a part of all manhood and womanhood, but not the foolish effort to perpetuate the regret or sorrow after due consideration should have laid it aside.

Cheerfulness is the next thing in life to godliness, and instead of making keepsakes or injuries done us by accidents or design, let us lay away the yesterday's troubles with our cast-off-clothing, as having done its purpose, served its office, and being no longer of practical use.

It is touching a tender subject to say to a woman that she shall not keep the little shoes, the hat and dresses, and doll's house about her, day by day, the same after her child is with the angels as when it prattled in her care; but to those who can by easy remorse and judicious disposal and change withdraw from view the unnecessary mementoes and reminders of sorrow, there is an opportunity for doing a service of inestimable value.

There may be no harm in storing away the little articles, the mementoes, in convenient or remote places where purposed effort may turn to them, but there is much pity for the otherwise healthful mother of intelligence and native energy who must live day by day in the presence of the things which most disturb her happiness, and tend to bow her perpetually under the heavy influence.

Cannot thousands such make a determined effort and lay away sorrows, and live in the hopeful view that there are health, love and desirable purposes of life to be lived for?

To by far the greater number of persons who will thus be persuaded to step out from under the gloomy shadow, there will early come most delightfully interesting tasks of value to them over the world. B—A—B.

PROFESSOR MARIA MITCHELL, at Vassar College, always gives a "Dome Party" to her graduating astronomy class.

MISS LILIAN WHITING, of the Boston Traveler, is at the Concord School of Philosophy, in the interest of that paper.

My wife and daughter were made healthy by the use of Hop Bitters and I recommend them to my people.—Methodist Clergyman.—*Adv.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CONCERNING STORE BILLS.

MARY WAGER-FISHER.

IF I were to proffer a bit of advice to young people at the outset of their housekeeping, the sentence that I would put foremost would be, "*Don't run up a store bill!*" And there are people no longer very young who would profit by heeding the homely advice.

The habit of having small bills charged becomes, after a time, a seeming necessity to certain classes of people, while to many of them it seems such from the outset of their beginning. Certain articles are required, there is no ready cash to pay for them, the shop-keeper is asked to charge the amount, and so the account continues with frequent additions, until at the end of a year, there's a large bill to be paid for what, it appears, there has been no substantial benefit from. My knowledge of "store bills" is of an entirely indirect character, for if my memory serves me rightly, I never had a store bill charged. My father very thoroughly trained me never to buy an article unless I had the money in my pocket to pay for it, and the older I grow, the more apparent the soundness of that principle becomes. If I had no other cause for which to thank his memory, that alone would be sufficient to fill my heart with a large measure of gratitude, as it has saved me a great deal of annoyance, as well as of money. It has saved me from buying what I really did not need. It has saved me from the mortification of small debts. It has taught me to discriminate between real and apparent necessities. It has held me to a wise decision in innumerable instances. It is an invaluable doctrine to teach a child, and I in turn shall teach it to mine with explicit care. But "indirect knowledge" is sometimes very emphatic, and from what I know of "store bills," I judge there is nothing else that eats up so surprising an amount of money, and yields in turn so little satisfaction. I have observed, too, that the habit of making such bills, leads people into dishonest dealing, and bills are run up, here and there, whenever one can get trusted, until finally honest payment is out of the question, and the shop-keeper may "whistle" for his money. There are people who have no conscience whatever about their indebtedness to shop-keepers, their entire anxiety being limited to ways and means of supplying their wants, and who will wear a garment that is unpaid for with all the *aplomb* imaginable. Such people have no true pride of character and the audacity with which they face the world is simply incomprehensible. But to the person of ordinary feeling and honesty, to be in the meshes of small debts, must be very harrowing. I can't well imagine anything more uncomfortable than to owe for one's tea and coffee, sugar and rice, nutmeg and allspice—to always be cognizant of the fact that the food you eat and the clothes you wear are unpaid for! A large debt, like that for land, or for any basis upon which one's income is to be obtained, is altogether a different affair, while to be owing for what is all the time being lost sight of, really, what is more annoying and degrading, too? As a rule, I opine, the bulk of store bills is made up of what *could have been dispensed with*, until the money was at hand to pay for them. The people who at once dispute this, are those who have never made the experiment of dispensing with what cannot be paid for on the spot, and to my mind there is no comparison between the "enjoyment" of gratifying one's appetite, at the cost of self-respect, and the freedom and independence of mind that comes from self denial, for the worst slavery is that which hampers the mind and vexes and irritates its serenity. To incur debts for the sake of "keeping up appearances," is to mortgage one's liberty to the most ungrateful of things—the public. I can see no difference between living off the charity of others, and in buying what you require "on credit," where you do not see your way clear to the honorable payment of such debts, except, that in the one case, the help extended is gratuitous, while in the other it is extortion in legal parlance. The result is the same, it is living off the labor and income of other people.

There is no time in the career of householders, when self denial and a resolve to keep free from small debts, can be more easily put in practice than by young people at the outset of their housekeeping. They have youth and health and hope and ambition, and can forego many luxuries and "necessaries" that would be hard for old people to dispense with. At all events, I believe it to be the experience of the majority of people, that money, or its equivalent, usually comes, *somehow*, to meet the demands of what is *absolutely essential*, and that it is possible for even the poorest to avoid running in debt for their daily expenses.

I used often to see a poor little lady in Paris, who earned a modest living by teaching music and French, and when pinched by her poverty, she comforted herself by saying: "It is so *distingue* to be poor—and *honest*," and I often think of the consolation lying in the truth of her remark To be poor, and to owe no man beyond one's means, is consistent with great happiness. But there is nothing at all "distinguished" in being poor, and in debt up to your ears. I would have peace and freedom of mind, if I had to live on a crust and had nothing better with which to serve my friends.

THE KITCHEN CLUB HAVE A PICNIC.

ANNIE L. JACK.

THE mid-summer heat has well-nigh passed and there comes now a little breathing spell broken only at intervals in the housekeepers routine—by preserving and pickling the later fruits and vegetables. So the members of the Kitchen Club thought they would have one holiday, and with wonderful and mysterious baskets they met at a grove near-by to enjoy the rest and shade afforded. No subject had been prepared, the talk was desultory, but many things spoken of were important and useful, as is often the case in "a multitude of counsel." Mrs. Stratford had just put her daughter to school in a distant city and we discussed the *pro* and *con* with her, and by a quiet count I discovered that more people were in favor of a course of home training than that of the boarding-school when the influence of home was pure and good. Then Miss Renshaw, the teacher, had successfully carried out a pleasant little concert a few evenings before, and the chief topic of interest was whether it was to the advantage of our children to take part in these entertainments. The gem of the evening was a "Floral Cantata" called "The Quarrel among the Flowers" by a number of little girls. It is musical throughout with such charming little bits of harmony and pretty airs that they haunt one long afterward. Some mothers thought this was likely to make the children vain, and forward, but I argued that while it would give them confidence it need not add to their vanity, for I thought the dressing in simple white, with beautiful flowers for ornament, was not so likely to create pride as the jewelry so often put upon little girls for display even at church, and other public gatherings. Mrs. Rhodes shook her head, she thought the girls who took part in the Cantata had spent much time and thought upon their dress. "So did you Auntie Rhodes on that nice new cap" said saucy Nellie Rhodes who had been one of the "flowers" at the concert. I thought it was a mistake to assert that such a pure exhibition fostered pride—that it was the very thing to give children grace and ease of manner. But, of course, it would not do to be carried to excess. It is too much of anything that is injurious, and that must be guarded against. Our talk had occupied all the spare time and we had none left to speak about the generous dainties that were spread for our picnic, some of which I will give to our readers in time for the Fall shows, at which time it is pleasant to have a picnic lunch.

DOMESTIC RECIPES.

Sweet Potato Pie.

BOIL until two-thirds tender then skin and slice. Line a tin pie-plate with a good crust, put in a layer of the sliced potatoes, sprinkle abundantly with white sugar, dust with cinnamon and then alternate until the dish is full. Add a little water, two spoonfuls of melted butter and a teaspoonful of lemon extract. Cover with paste and bake.

Tomato Soup.

Slice an onion and fry to a reddish-brown in a soup-pot in two spoonfuls of beef drippings; then add a dozen good-sized tomatoes peeled and sliced, and when very hot put in three pints of boiling water with a spoonful of chopped parsley. Boil half an hour then pass through a sieve, rubbing through the tomatoes, and return to the pot. Season with pepper, salt, two spoonfuls of butter rolled in flour and when boiling stir in a cupful of hot boiled rice. Simmer 10 minutes and serve.

MRS. KATE BIRDSLEY.

QUESTIONS ANSWERED.

Charlotte Russe and Lady Fingers.

Will you please give recipes for the above and oblige, M. D.

ANS.—*For Charlotte-Russe:* Cut sponge cake into slices and line bottom and sides of a Charlotte pan or mold. Whip one pint of thick, sweet cream, flavored with vanilla, or any other flavoring you fancy, to a stiff froth, and add to it the well beaten whites of two eggs and one half pound of pulverized sugar. Mix lightly and carefully together. Fill the lined mold and set on ice to harden. If preferred, several small charlottes can be made instead of one large one. Many add gelatine but it is unnecessary as it will harden without it.

For Lady Fingers: Mix the beaten yelks of six eggs with half a pound of powdered sugar until the mixture becomes frothy, then stir in the whites of the eggs beaten to a stiff froth and at the same time a quarter of a pound of flour dried and sifted. Put the batter into a meringue bag and squeeze it through onto pans lined with paper not buttered, in strips three inches long. Sprinkle over a little fine sugar and bake 15 minutes in a moderate oven. The bag spoken of is funnel-shaped and made of firm twilled cloth. At the bottom a small, tin tube one-third or one-half inch in diameter is fastened while the top is gathered with a shirr string. This bag will be found very convenient in making macaroons, icing cakes, etc.

Old men, tottering round from Rheumatism, Kidney trouble or any weakness will be made almost new by using Hop Bitters freely.—*Adv.*

News of the Week.

HOME NEWS.

MONDAY, August 8, 1881.

The President's condition remains favorable according to the latest reports. There was a slight increase of fever on Saturday and Sunday, but there is no cause for anxiety the physicians say, these variations being due to local and comparatively unimportant causes.

The front doors of the new house of William H. Vanderbilt in New York will cost, including settings, $25,000. They are of bronze and fac-similies of those of the Church of San Angelo at Rome.

Electric lights are beginning to scatter their brilliancy all over the country. The little city of Aurora, Ill., is to be illuminated from lights placed on tall iron pillars.

Four colored men were appointed to the police force last week in Philadelphia, being the first of the race to wear police uniform in that city.

There is great excitement over the discovery of rich carbonates nine miles west of Deadwood, D. T. Ore brought in week before last is alive with native silver, and assayed $2,600 to the ton. Big strikes are made in the Lawrence, Utica, Amsterdam, Greenland and Jefferson mines, and miners are flocking thither from all parts of the hills.

The Canadian census returns for 1881 show a total population of 4,350,930, an estimated increase of 710,565 in 10 years. Ontario has 1,913,460 inhabitants, an increase of 290,609; Quebec, 1,853,469, an increase of 156,953; Nova Scotia, 440,585, an increase of 52,785; New Brunswick, 321,129, an increase of 35,594; Prince Edward Island, 107,787, an increase of 13,760. The population of British Columbia and Northwest Territory is estimated at 160,000. The census of 1873 gave British Columbia 60,000 inhabitants including Indians.

The Postmaster General has decided to reduce the amount allowed for clerk hire in post offices where the present allowance is in excess of the sum allowed by law. There are about 150 offices in this class.

Major-General Hancock has been invited to take command of the troops at the Yorktown celebration, in October.

The Chicago and Wilmington Coal Company, being unable to secure workmen enough, has sent an agent to Europe to engage and bring over 500 practical miners with their families as soon as possible.

Palatine, N. Y,, is the richest village of the size in the world. It has about 500 inhabitants, and it is said that over thirty of these are worth from $5,000,000 to $20,000,000, while six are said to be worth over $20,000,000.

The Emperor of Germany has conferred upon Prof. Dwight Whitney, of Connecticut, the order of merit made vacant by the death of Carlyle.

The Hon. William G. Fargo, President of the American Express Company, died at his residence in Buffalo on the 3d inst., after a long and painful illness. He was the eldest son of William C. Fargo, a descendent of Moses Fargo (or Firgo, as it was written) who emigrated from England to Connecticut about 1670.

A dispatch from San Francisco announces the death from uræmia, at Salem, Oregon, of Bishop Erastus Haven of Syracuse, the distinguished educator and scholar. Bishop Haven was born in Boston, Nov. 1, 1820, and was graduated from the Wesleyan University in 1842.

The ceremony of laying the corner-stone of the monument to Gov. Caswell, the Revolutionary war Governor of North Carolina, attracted fully 10,000 persons to the village of Kinston, N. C., on the 3d inst. Senator Vance delivered an eloquent address, and Gov. Jarvis made a stirring speech. Grand Master H. F. Grainger laid the corner-stone with Masonic ceremonies.

George Morrison, living at Brownsville, near Newark, Ohio, remarked, upon hearing of the shooting of President Garfield, that he hoped the President would die. An old soldier named C. A. Cook, who was standing by, slapped Morrison in the mouth. For this act the old soldier was arrested, and he has been fined $10 and the costs, which amounted to $22. The Commercial, of Cincinnati, announced that it would receive one cent subscriptions from citizens, the money to be used in paying the fine and costs against Cook. The response was overwhelming. Before night over 8,000 names had been placed upon the subscription list, each for one cent. The names of wealthy citizens and the poorest laboring men appear side by side. Over 15,000 names are now on the list.

The officers and Commissioners of the Yorktown Centennial Association held a meeting at their rooms, in the Exchange Hotel, in Richmond, Va., on the 1st inst., and finally prepared a programme of ceremonies in addition to that arranged and already promulgated by the Congressional Commission. The celebration will be formally opened, under the auspices of the Association, on Thursday, 13th October, and will be continued until the 18th, when the national ceremonies will begin. Mr. John Goode, president of the Association, will deliver the opening address, and on alternate days addresses will be delivered by Secretary Windom, Mr. Carl Schurz and Mr. Frederick R. Coudert and Professor Elie Carlier, of New York. Religious services will be conducted on Sunday, 16th, in the morning, by the Right Rev. J. J. Keane, Catholic Bishop of Richmond, assisted by the most Rev. James Gibbons, arch-bishop of Baltimore and primate of the Catholic Church in the United States, and in the evening by the Rev. John Hall, of New York. The festivities will embrace grand pyrotechnic displays, promenade concerts every afternoon and evening and a grand national regatta on Saturday, 15th.

Four disappointed Arabs are in Boston. They were sheiks of distinction in their own country, and one claims to be the head of a Moabite tribe descended direct from the Moabites spoken of in the Bible. They were brought out here for exhibition and were told that they would become objects of social honor here. On the contrary, they proved unattractive as a show, and, being abandoned by their manager, are paupers, without much prospect of getting back home.

The Garfield boys are through with their classical review, and are brushing up their mathematics prior to entering Williams College next month. The college authorities will admit the boys on Dr. Hawke's, their instructor, certificate.

Dr. Tanner, at Erie, Pa. is drawing up propositions to the medical faculty of New York to fast three months. He claims that he can fast 95 days if fed on electricity, the air in the room to be charged with a strong current. He is now fattening for the fast.

Forest fires are raging all around Bay City, Mich. For a hundred miles north fences and farm buildings, in addition to vast quantities of pine timber are being destroyed. Trains find it almost impossible to run. The city is enveloped in a dense smoke and the air is full of burned leaves and ashes.

The Indian chief Ta-tan-ka-i-you-tan-ka, better known as Sitting Bull, gets the idea. He wants money for what he does now. A $10 note set his tongue to running very glibly for a reporter a few days ago and that's all that would do it. He is becoming civilized rapidly.

Mr. James G. Fair heads the personal assessment roll just filed in San Francisco with $42,200,000. Mr. J. C. Flood is assessed at $36,500,000 for himself, and $20,500,000 as trustee for J. W. Mackey. Mr. Charles Crocker is assessed at $20,000,000.

Postmaster General James is considering the feasibility of cheapening and facilitating the transmission of remittances thro' the mails. It is probable he will recommend to Congress the adoption of a new and safe system of postal money orders, which has been devised at the department.

Nathan Orlando Greenfield, the Orwell wife murderer, suffered capital punishment in the Onondaga Syracuse Penitentiary on the 5th inst., after a battle with the law lasting nearly six years.

The Brooklyn bridge is rapidly approaching completion. The contractors expect to have the promenade across the river open some time in October.

Thirty thousand persons have petitioned the Georgia Legislature asking that the people of the State be allowed to vote on the prohibition of the liquor traffic. The petition was 600 feet long, and had names from every county.

A Life Saved.

In letter from a lady at Council Grove, Kansas, the writer says: "I have used your Oxygen at times for nearly three years for *lung trouble*. Am nearly well now, and feel that it *has saved my life* as the disease is hereditary, and has been for *generations* in our family, *and I am the first one who has recovered after being attacked.*" Our Treatise on Compound Oxygen, containing large reports of cases, and full information, sent free. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

The northern part of the peninsula of Sturgeon Bay, Wis., has been damaged considerably by forest fires, which are raging now harder than ever, ruining cut and uncut timber and threatening immense damage. The people are seriously alarmed and doing everything possible to prevent the destruction of their chief source of revenue.... The commission of the General Land Office has reported favorably upon the request of the Yosemite commission and the Governor of California for the increase of the Yosemite valley reservation to include the Mariposa Big Tree reservation and surrounding territory.....The United States smoked 160,000,000 more cigarettes last year than the year before. Beer drinking and cigarette smoking are increasing more rapidly than any other ways of using barley and tobacco..... Col. Le Grand B. Cannon of Burlington, Vt., has sold his herd of Short-horns to Western men. This herd is said to be the largest and best in the country.....Paris green on the fingers of a Colraine, Mass., farmer while he was poisoning bugs became mixed with the "fine cut" in his tobacco box and caused him a severe illness.

A sixth volume of the Polled Cattle Herd Book has been issued by Mr. Alex. Ramsey, Secretary, Banff, Scotland.....At the Hamilton Short-horn sales at Winchester, Ky., the other day, the Rose of Sharon family brought an average of $1,500 each.... ...Pennsylvania has a law for the prevention of trespassing on gardens, yards, orchards, fields, etc., and doing damage to property of any kind. The fines for infraction are not less than $5 nor more than $50... .....A Berlin dispatch of the 4th says:—"The harvest prospects in Schleswig-Holstein have never been so bad as they are this year. Most of the farmers are getting quit of their cattle and horses, owing to the scarcity of fodder."

The sale of meat infected with trichinæ is subjected to severe punishment in Germany. A butcher and an inn-keeper of the city of Halberstadt, who failed to have pork that they offered for sale properly examined by the Government inspectors, and who were the cause in consequence of more than 100 cases of trichinosis, including four cases of death, have just been sentenced to three years' imprisonment.. .....The fifth annual meeting of the New York State Farmers' Alliance will be held at Watertown on Wednesday, August 24, at 11 A. M. Local and county Alliances, Grangers and Farmers' Clubs and Agricultural Societies are invited to send representatives. So are Anti-Monopoly Leagues. The Rome, Watertown and Ogdensburg Railroad will carry visitors for one cent a mile as the return fare.. ...The following details of the condition of wheat in the various States will be of interest just at this time:—

DEPARTMENT OF AGRICULTURE,
WASHINGTON, D. C., July 29, 1881.

AVERAGE CONDITION OF WHEAT JULY 10, 1881.

States.	Winter wheat.	Spring wheat.
Maine	87	92
New Hampshire	98	99
Vermont	97	86
Massachusetts	100	..
Connecticut	100	..
New York	88	98
New Jersey	83	..
Pennsylvania	102	97
Delaware	105	..
Maryland	87	..
Virginia	93	..
North Carolina	92	..
South Carolina	91	97
Georgia	92	77
Alabama	88	..
Mississippi	97	..
Texas	101	110
Arkansas	87	93
Tennessee	87	..
West Virginia	95	95

Colorado	90	108
Territories	97	97
General average.	83	90

Acting Commissioner Carman, in his letter accompanying the foregoing table, states:—"Our estimates of acreage not yet completed, but indicate an increase of about four per cent. in Winter wheat, and a lessened area of Spring wheat, owing to an unfavorable season for sowing.

The imports of flour into Great Britain in 1876 amounted to 850,000 barrels; they have been constantly increasing, until in 1879 and 1880 the amount was over 3,400,000 barrels, or about 800,000,000 pounds.....The Dairymen's Association of this State will hold a butter and cheese show in September, in connection with the Oneida County Fair, at Rome, N. Y. The whole State will probably be represented, and it will be a grand affair. ... .New York receives one-half of the cheese product of the country. Chicago comes next. Over 40,000,000 pounds of cheese were exported in 1880, Great Britain taking 65 per cent. of the quantity. The home cheese trade is growing rapidly, and assuming vast proportions. It is said to be increasing at the rate of 12,000,000 to 15,000,000 lbs. a year. The trade is much more concentrated than that of butter, only 12 States out of 38 producing as much cheese as butter.....Seth Green says of the distribution of California mountain trout in the waters of this State:—"One million two hundred thousand have been placed in about 150 different bodies of water. I am now getting favorable reports from the small fry. In three years they will be heard from in the shape of fish weighing a pound and a half. They will then furnish fine sport for the angler and excellent food. We are now very busily engaged in rebuilding ponds and repairing our hatching houses and apparatus for the coming season."..... ...Prof. Baird has called upon all those who wish eggs of the quinnat, or California salmon, to apply at once. The eggs are collected and packed at the expense of the United States Fish Commission, but they do not propose to pay the express charges. Each order should be for at least 50,000 eggs....The Mark Lane Express of Aug. 1 says:—"The temperature the past week has been on an average 30 degrees lower than during the late spell of heat. There have been general rains and local thunder storms, but wheat was not thick enough to take serious damage. The nights have been cold in England and severe night frosts in Scotland will retard the harvest there. Mildew is reported among the wheat in various parts of England. A decline in the temperature will not be of advantage to wheats except in North England. The barley crop will be very good in some localities, but in the remainder it is of very irregular growth, and has ripened prematurely. Oats are good in Ireland and parts of Scotland, but variable and generally indifferent in England."..... Two car-loads of Spring wheat were received in Chicago on July 29 from Nebraska. One inspected No. 2 and the other No. 3. Last year the first arrivals were from Missouri on July 21.

In Florida the value per acre of cleared land is $9 48, and of timbered land $3 03. In Louisiana cleared land is worth $14 36, and timbered land $3 53. In Texas cleared land is worth $8 98, and timbered $4. In Arkansas cleared land is valued at $11 78, and timbered land at $3 58. In Oregon cleared land is worth $21 71, and timbered $4 50. But in Nebraska cleared land is worth $8 82, and timbered $25 85 per acre.....Recent Mail advices from Melbourne, Australia, state that the rainfall had been insufficient for wheat fields and pastures. Frosts are also reported. The wheat statistics for last year issued by the government had been corrected so as to increase the yield by 230,020 bushels, but the Melbourne Argus says that, even with this addition, it was clear that the colony had exported too much, and that 120,000 bushels would have to be imported for seed. The revised figures still showed a deficiency against the preceding year, notwithstanding the increased acreage.....The official wheat statistics for South Australia for the year 1880-81 had also been published. The area under wheat was 1,733,542 acres, and the yield 8,606,610 bushels, giving an average of four bushels 58 pounds per acre. In the preceding year the yield was 14,260,064 bushels, giving an average of nine bushels, 47 pounds per acre, so that in South Australia, as in Victoria, there was a marked decrease in the productiveness of the land during last year.....Paris postal reports from France of July 16 state that the temperature during the week had been higher, causing fresh complaints, much grain having matured too rapidly, causing deficiency in weight. As regards wheat, which might have been over an average, it will only perhaps just come up to one.....

DANDRUFF

Is Removed by the Use of Cocoaine,

And it stimulates and promotes the growth of the hair.

Burnetts Flavoring Extracts are the best.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

Lydia E. Pinkham's Vegetable Compound has done thousands of women more good than the medicines of many doctors. It is a positive cure for all female complaints. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

Ask any good doctor if Hop Bitters are not the best family medicine on earth.

Nature's Sluice-Way.

The kidneys are nature's sluice-way to wash out the debris of our constantly changing bodies. If they do not work properly the trouble is felt everywhere. Then be wise and as soon as you see the signs of disorder get a package of Kidney-Wort.—Constitution.

The Markets.

CROPS AND MARKETS.

WHEN we went to press this time last week agriculturists all over the country were praying or wishing for rain. In the North another week or two of dry weather would be the ruin of the corn crop and greatly injure most of the others still in the field; while in the South a little longer drought would inevitably greatly damage cotton, already in a very critical condition. During the week ending last Friday evening the rainfall in the Cotton Belt was much smaller than during the corresponding week last year, as shown by the following extract from the meterological summary telegraphed to this city by the Signal Service Bureau at Washington:—

Stations.	Rainfall—Inches, 1881.	Rainfall—Inches, 1880.
Fort Gibson, Indian Ter	0.02	2 34
Little Rock, Ark	0 00	0.77
Shreveport, La	†	1.69
Port Eads, La.*	0.64	3.74
Corsicana, Tex	0.00	0.15

* As compared with New Orleans, † Inappreciable.

Total, 26 stations; average rainfall, 1.28 inches, against 1.52 inches last year. HAZEN.

Washington, August 5.

During the past week the New York cotton market has been very strong for future delivery especially for August. Spot cotton opened firm and prices were advanced ⅛c. this day week after an advance of ⅛c. on the previous Saturday. On Thursday, however, quotations were reduced 1-16c. per pound on low middling and above; ⅛c. on strict good ordinary; 3-16c. on ordinary and good ordinary; and 5-16 on ordinary. The closing quotations last Friday in this market compare with those at the corresponding date last year, thus:

	Last Friday.	Last year
Ordinary	8⅛	8 3-16
Good ordinary	1-16	9 11-16
Low middling	11⅜	10 15-16
Middling	1-16	11 9-16
Good middling	9-16	12 1-16
Fair	5-16	13 7-16

The sales for the week summed up 373,400 bales against 214,600 bales for the corresponding week last year. The following shows the closing prices in "futures" in this market:

	Last Friday.	Last year.
August	12.18	11.40
September	11.31	10.88
October	10.72	10.58
November	10.55	10.47
December	10.55	10.48
January	10.66	10.57
February	10.78	10.70

The prices show an advance in the week of 19 points on the early months, and of six points on the later months.

The Southern markets have been firm, and have generally advanced during the week. The following are the sales for the week and closing quotations at five leading ports as compared with last year's quotations:

	Week's sales.	Last Saturday.	Last year.
Galveston	470	11¼c.	10⅞c.
New Orleans	3,600	11⅞	11⅝
Mobile	300	11⅜	11
Savannah	700	11¼	11
Charleston	275	11⅜	11⅜

After two days bank holiday the Liverpool market opened on Tuesday steady, and has continued so till close, though at close prices were somewhat easier. The following were the latest quo-

tations for uplands at Liverpool, compared with those of same date last year:

	Last Saturday.	Last year.
Good ordinary	5 7/8d.	6d.
Low middling	6 3/8	6 1/4
Middling	6 13-16	6 13-16

Orleans cotton is quoted 1-16 higher.

The receipts to date show an increase of 825,425 bales over those received last year to the same time. The total at each port is as follows:

New Orleans, bales		1,559,025
Mobile	"	384,266
Galveston	"	670,355
Savannah	"	869,242
Charleston	"	619,396
Wilmington	"	116,419
Norfolk	"	715,010
Other ports	"	793,535

The latest reports announce considerable rainfall in most of the Cotton Belt, and as this would brighten the prospects for an unusually large crop, prices for futures after this month have a downward tendency.

Telegrams to Bradstreet's announce that copious rains have fallen during the week over a large portion of the Cotton Belt. Charleston telegraphs that rain has fallen all over the State during the week. Savannah reports that rain has fallen steadily since Saturday, July 30. Galveston reports improved cotton prospects, owing to increased rain, but that in some localities in Texas the drought has held on. At Memphis the weather has continued dry, but with prospects of rain. Along the entire line of the Mobile and Ohio Railroad, from Columbus, Ky., 500 miles south, to Mobile, fine rains have fallen. The Signal Office gives the average fall, as reported from 25 stations in the Cotton Belt, 1.23 inch, against 0.78 inch for the previous week. Advices from Galveston on the 5th say new cotton from all parts of the State was coming in small quantities daily.

Advices from Western Europe do not speak so exultantly of crops; and reports from this country bear out our predictions, in the main, or thereabouts. Accordingly prices of cereals have been firm during the week and business both in wheat and corn here has been on a liberal scale and at present the drift of opinion seems to be in favor of higher figures. Up to last Friday evening New York prices showed an advance on wheat of 1½@3c. and on corn, of 2@5c. per bushel, on very extensive transactions, No. 2 corn for September and October gaining most. Spring wheat attracted more attention from export buyers near the close, especially No. 2 Chicago and Milwaukee, which rallied from the lowest figure of the week about 1½@2c. per bushel. Here, as at the principal points of the interior, the bulk of the winter wheat arrivals represented the new crop, and, all the circumstances considered, it grades well up to the received standards. Oats and rye closed higher than a week ago, and flour also is hardening a little.

As the following table shows, most of the sales of cereals here, like those at other points, are for future delivery, the prices of which are to be found in our market reports.

CLASSIFICATION OF SALES OF GRAIN IN NEW YORK.

		Prompt deliveries, bushels.	Options. bushels.
Wheat—	Week end'g Aug 5..	*1,945,000	8,304,000
	Preceding week....	1,891,000	11,906,000
Corn —	Week end'g Aug. 5..	1,690,000	6,319,000
	Preceding week....	2,009,000	6,024,000
Oats —	Week end'g Aug. 5..	558,000	670,000
	Preceding week....	617,000	425,000
Rye —	Week end'g Aug. 5..	16,000	24,000
	Preceding week....	14,500	4,000

*Of the wheat sold for prompt delivery were 322,000 bushels Spring, including 171,000 bushels No. 2 Chicago and Milwaukee.

While our exports of wheat flour and corn-meal have increased considerably since last year, those of other cereals have fallen off, as seen by the following table of exports from this port from Jan. 1 to Aug. 1.

	1880.	1881.
Flour, barrels	2,325,600	2,917,650
Corn-meal, barrels	104,000	125,250
Wheat, bushels	34,393,500	24,655,000
Corn, "	28,657,500	20,274,600
Rye, "	951,900	711,250
Barley, "	202,650	15,150
Oats, "	392,000	131,200
Peas, "	213,300	170,700

The visible supply at latest date is somewhat larger than last year, but not large enough to account for the smaller amount shipped, as is here seen:

THE VISIBLE SUPPLY OF GRAIN, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail, on lakes, on canals and on Mississippi River:

	1881. July 30. bush.	1880. Aug. 1. bush.	1879. Aug 3. bush.
Wheat	16,772,508	14,272,015	14,352,416
Corn	15,928,014	16,739,593	11 000,554
Oats	7,373,806	1,506,377	1,762,250
Barley	124,808	176,204	324,929
Rye	188,836	271,912	462,436
Total	40,387,972	32,976,101	28,001,585

P. S.—Telegrams received this afternoon from Cincinnati—the chief collecting point for telegrams in the country—say there were copious rainfalls yesterday (Sunday) all over Ohio, Indiana, Illinois, and probably over most of the Northwest. "There are millions" in these rains for farmers.

Temperance clergymen, lawyers, ladies and doctors use Hop Bitters, as they do not intoxicate, but restore brain and nerve waste.—*Adv.*

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, August 6.

Chicago.—Wheat active and firm; No. 2 Chicago Spring, $1.24½ cash; $1.23¾ August; $1.17¾@1.17⅞ September; $1.17¼, October; No 3 do. $1.05@1.10; Rejected, 79½@80c. Corn active but weak at 52¼ 52⅜c. cash; 42⅝@52⅜c. August; 41⅛@53¾c. September; 54@54½c. October; Rejected, 47½c. Oats dull and weak at 31½@32c., cash; 31¾c., August; 31⅞c. September, 32c.. October. Rye firmer at 85c. Pork easy at $18, cash, $17.90@17.95 August, September, and October. Lard steady, with a fair demand; $11.40cash; $11.42½@11.45, September and October. Bulk-meats steady and unchanged. BUTTER.—Strictly fine goods are held at outside quotations; indeed, higher figures are being realized for favorite brands. Creamery, choice, 22@24c.; do. fair to good, dairy, choice, 19@20c.; do. fair to good, 15@18c; packing stock, 11@13c.; grease, 7@8c. CHEESE.—Full-cream, 9½@10½c.; part skim cheddar, choice, 8½@9¼c.; do. flat, choice, 8½@9½c.; do. common to good, 6@8c.; low grades, 3@5c. HOGS.—Fair demand and steady; good to choice shipping, $6.50@6.80; common to fair packing, $6 @6.45; light, $6.20@6.70; skips and culls, $4.40@6. CATTLE.—Market steady; good to choice shipping, $5.70@6.20; common to fair, $4.50@5.20; butchers' steers, $3.75@4.25; cows, $2.25@3.75; bulls and mixee, $2.50@3.50; stockers and feeders, $2.65@ 3.90; Texans, $3@3.75. SHEEP.—Market steady, with a fair demand; common to medium, $3@4; good fat, $4.30@4.75.

Cincinnati.—WHEAT strong and 1c.@2c. higher than on Friday; No. 2 Red Winter, $1.25@$1.27; No. 2 Amber, 11.23@1.25; Corn excited and 3c.@ 4c. higher than yesterday; No. 2 Mixed, 59c.; August, 58½c. Rye strong and higher; No. 2 95c. Barley strong; No. 2 fall, $1. Pork quiet at $18.25. Lard easier at 11¼c. Bulk-meats and Bacon steady and unchanged. Butter quiet; fancy Creamery higher at 23c. Sugar firmer, but not quotably higher. Hogs quiet and unchanged. Fancy Creamery sells at 25c. prime do. at 23@24c. choice dairy at 20c. prime to choice Western Reserve 18@ 20c. prime Central Ohio at 14@16c. and common do. at 12@13c. ₱ lb. CHEESE.—There is a fair demand, and under moderate receipts the market rules stronger for prime to choice factory 9½@ 10¼c, per lb. EGGS.—Firm at 10@10½c. per dozen for fresh, guaranteed. HEMP.—Is in light supply and prices are firm. Rough Kentucky sells at $130.00 per ton from store. Single dressed sells at 8@8½ and double do. at 9@10c ₱ lb. from store. PEANUTS.—There has been considerable speculative as well as a good consumptive demand, and prices have advanced largely and rapidly, closing about ½@1c per lb higher than a week ago. Common to good Tennessee white sell at 3½@4c. prime 4¼@4½c, choice hand-picked at 4¾@5, common to choice Red and at 3½@4c, and Virginia at 5½@6 per lb. Small lots ¼c more.

St. Louis.—Wheat firm and higher; No. 2 Red Fall, $1.22⅞@1.23¼, cash; $1.23¼ August; $1.23⅝ @1.24½, September; $1.25¾@1.26¼, October; $1.27½@1.28¾, November; $1.30¼@1 31, December; $1.20¾@$1.23½ all the year; No. 3 do $1.14¼@1.15¾ No. 4 do., $1.10¼. Corn weak at 54½c.@55c., cash; 55c., August, 54⅞c@55½c., September; 54½c. @55c., October; 51½c.@52¾c., all the year. Oats weak at 35¾c@36¼c., according to location, cash; 34½c@34⅞c., August; 33¾c.@35c. September; 33½c.@34c. October 33@33 1-3c. Rye slow 34½ bid. Bacon slow; Shoulders, 7⅜ cents; Clear Rib 10¾c. Clear Sides, 10¾c. Hogs slow; Yorkers, $6.35@6.45; packing, $6.10@6 40; choice to fancy heavy, $ 50@6.80: Cattle supply large; good fat shipping Steers command good prices, but half-fatted cattle are slow; all grades have declined appreciably within three days; export Steers, $5.80@6; heavy fat Steers, $5.50@5.80; light do.. $5@5.40; native butchers' Steers, $3@4: Cows and Heifers and Grass Texans, $2.50@3.75.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug. 6, 1881.

BEANS AND PEAS.—The demand is light, but there is no urgency to sell fine white maras, as the stock is not above what can be used with fair attention by the time new crop appears, colored beans quiet. Green peas offered at $1.15@1.50 for best Wisconsin.

Marrow beans, prime, $2.42½@2.45; other, $2.25@ 2.37½; medium, prime, $2.42½@2.45; other, $2.25@ 2.37½; peas, $2.35@2 60; white kidney, $2.25@2.45; red kidney, prime, $1.55@1.60; fair to good, $1.40@1.50; black or turtle soup, $1.30@1.35.

Receipts for week, 5,070 bush.

Exports do. 1,100 pkgs.

BEESWAX.—Demand light at 23@24½c.

BUTTER.—Current receipts of fine of any style of package have found a ready sale, the advance noted is for faultless selected lots. If these prices can be made to hold a week some of the stored stock of choice table will find a profitable place. Western is already doing better in the fall range.

Creamery—Western, good to choice 21@24c; Ohio, choice, 23@24c.; do. good to prime, 21@22½c.; State and Pa. good to choice, 24c.; State sweet cream 23@24c.; poor 18@20c; State pails and h'f tubs, choice 22@25c; fair to prime 20@22c.; Welsh tubs, 19@20½c.; State dairy tubs, poor to fair, 17@19c; firkins, fair to fine, 20@23½c.; Western imitation creamery 17@20c.; dairy, fresh choice 18@19c., other 13@17c.; factory, Iowa, fine June, 17@18c.; other 11@17c.

COMPARATIVE RECEIPTS AND EXPORTS FROM MAY 1

	Rects. pkgs.	Exp'ts, firkins.
May 1, 1881, to Aug. 1, 1881	494,462	68,043
May 1, 1880, to Aug. 1, 1880	473,135	103,705
May 1, 1879, to Aug. 1, 1879	478,868	92,135
May 1, 1878, to Aug. 1, 1878	40,,987	75,580
May 1, 1877, to Aug. 1, 1877	353 211	91,22

CHEESE.—The week has been a tame one and it is not likely that much animation will develop during the possible hot month of August when uncertain grades are apt to be the ruling ones. There does not seem to be any urgent export orders and best shippers at this advanced period will hold off for the desirable late grades.

State fact'y, fine, col'd, 10¾@10½c. do. white, 10¼@ 10⅝c; good to prime, 9¾@10c; fair to good 9@9¾c; poor to fair 8½@9c; Wis nominal; Ohio, factory, cheddar, fine 9¾@9¾c; fair to prime 8¾@9c' flat, fine 9c, good to prime 8@8¾c; fair to good 7¾@8c, poor 7@7¾c, creamery part skimmed, 5@6¾c.; full skims, 3@4c.

Receipts for week, 86,824 boxes.

Exports for week, 74,611 boxes.

Liverpool cable, 53s. 6d.@54s. 6d.

Steam to Liverpool, 3os.@37s. 6d.

RICE.—The market has a firm temper and is fairly active. Quotations are—

Carolina and La. common to fair at 4¾@5¼c; good to prime at 5¾@6¾c.; choice at 6¾@7¾c.

COTTON.—The market has been somewhat listless operators for cotton for use seem disposed to await the development of new crops. Besides a good many prominent dealers are out of town, Liverpool prices reported firm and home spinners are buying small but steady supplies.

Quotations are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

The averages of yesterday's forward deliveries as officially reported were as follows:—

August, 12.09c.; September, 11.18c.; October, 10.95c.; November, 10.41c.; December, 10.41c.; January, 10.51c.; February, 10.62c.; March, 10.76c.; April, 10.93c.; May 11.08c.

DRIED FRUITS.—The principal sorts hold their late speculative pace and there has been some actual trade at the new figures for apples and peaches. Small fruits of not much interest at present.

Apples, evaporated rings, choice 12c.; prime 11@ 11¼c.; fair to good 10½@11c; Southern in bbls. 4¾@ 5¼c.; do. in bags, 4¾@5¼c; State fine cut 6¼@6½c.; quarters choice, 6@6¼c.; small lots 5¾@6c; Western, fair to choice, 5@6¼c, evaporated peaches peeled 33@ 34c.; N. C. do. 19@25c., Ga. do. 17@ 23c.; State 17@19c.; old poor to prime 12 @18c. Penn. halves 6¾@6¾c.; unpeeled ₱ qt. 5¾@6¾c. Blackberries, prime old, 9c. Cherries, Southern dry, 20c. Raspberries, prime new 25@26c. Whortleberries, prime 12½c.

Receipts for the week, all kinds, 633 pkgs.

Exports dried apples, 50 pkgs.

EGGS—Receipts for week, 7,800 bbls.; do. last week 6,687 do. Western had begun to arrive in more merchantable condition, but unfortunately the weather is now severe on this end of the route and another blue week is looked for. Supplies are small but there is not life enough in the demand to make strong rates.

Near points 19c.; State and Pa. 17½@18c. Canadian, 16½@17c.; Western, choice, 15½@16c.; inferior lots 9@14c.

FRESH FRUITS.—With improved quality apples have a better sale. Pears are in good supply; a good state crop expected. Grapes have appeared and will have a show, as berries are giving out. Peaches scarce and high. Melons in good demand.

Apples, Nyack Pippin ₱ bbl. $2; Orange $3; Sweet Bough, $1.50@1 75; Sour $1.50@2; Bough Interior $1 a 1.25; Red Astrachan $1.20 2; soth'n ₱ bu. crate, 60@ 75c. Pears, Bartlett Sav. ₱ cr. $2@4; do. Peanuts, Va. hand-picked ₱ lb. 5¾@6c.; do. fancy, 5¼@5½c.; do. extra prime, 5@5¼c.; do. good to prime, 4¾@4¾c.; shelled, 3½@3¾c. Pecan nuts, ₱ lb, 7@9c.

FLOUR.—Severe weather for quality has kept up and as before the low grades are not worked in to more than want-filling extent by exporters. Patents and high family grades are in demand Rye flour is high.

No. 2, ₱ bbl., $3.30@3.50; State and Western superfine, $4.30@4.75; city mills extra, $6.25@6.50; Spring wheat do. $4.85@5.15; Spring XX and XXX, $5.25@ 6.75; patents, $6.00@8 00; Ohio round hoop shipping, $5.00@5.40; trade brands, $5.50@6.25; St. Louis extra, $5.10@5.50; do. double extra, $5.65@6.25; do. family, $6.40 @7; South'n ext. shipping, $5.40@6; do. XX and family, $6.25@7.25. Rye, superfine, $5 40@5.75. Corn-meal, Brandywine, $3.50; Western, $3.00@3.30.

Receipts for week, flour 115,451; bbls., corn-meal do. 1,750.

Exports for week, flour, 64,875 bbls.; corn-meal do. 3,125.

GRAIN.—Prices for wheat have put the product out of exporters' limit or views and the market for the moment is in the hands of speculators with crop reports pointing to easier rates. Corn has been unusually active and with outside capitalists dealing heavily in futures the market has had a strong upward movement. There has not been as much spot business as for last week. Crop reports have tended to make owners cautious in their liberation of stock. The settlement of last month's contracts in oats sent the market down four or five cents during the week; the close is showing rather more vigor. A good yield of State is expected.

Wheat, Spring $1.10@1.35. do, No. 2. $1.21@1.23; do No. 3. $1.15@1.17; red Winter No. 2, $1.27½@1.27¾; red Winter $1.12@1.13; white Western and State $1.15@ 1.27. Rye, 86@91c. Oats, white No. 1, 60c.; white No. 2, 46c.; white No. 3, 45c; mixed No. 1, 46c; do, No. 2 45½c; do. No. 3 42@44c; Corn, Western mixed 59@60c.; do. No. 2, 59@59½c.; do. yellow, 58@62c.; do. white 59@62c; Southern yellow —@ —c.; do. white 60@63c.

Receipts for week, wheat, bush., 1,101,650,; corn, do 1 193,158; oats do. 155,740: rye, do. 2,374; malt, do. 72,000; rice pkgs. 1,939.

Exports for week, wheat, bush 883,850; corn, do 716-233; oats, do. 6,168. rice, pkgs., 650.

HAY AND STRAW.—The abundant yield of the hay crop this season hereabouts and at many inner railroad sources has prompted shippers and farmers to forward any reserve of choice hay they have been holding. At all events the offering is quite attractive and a fairly brisk business follows the easy evident rates. Straw will have a cheap season in the common grades.

Prime retailing timothy hay, 85@90c. ₱ 100 lbs.; medium do. 60@75c, do.; shipping grades 50@55c. do.; clover mixed 50@55c; clover 35@45c. Straw, long rye 80@85c; short do. 55@60c. other grain, 30@40c.

Exports for week 1,017 bales.

HOPS.—Brewers have replenished to some extent taking about all the good hops offering. It is thought that new crop will have a fairly clear market to open on. English market dull. Reports from the German crop good.

State crop of '80, choice, 20@22c; good to prime, 16@ 18c; fair to good, 13@14c; poor to fair, 11@13c; Eastern, 11@17c.; '79's, fair to prime, 5@8c.

Receipts for week, 958 bales.

Exports for week, 27 bales.

LEATHER.—Quotations are

MILK.—Supplies still exceed consumption. The average for commission milk during the week was $1.13 per can of 40 quarts. The country price paid to farmers for the month of July was 1½@2c; platform or commission did about as well.

OIL CAKE.—Western quoted $31.

POULTRY AND GAME.—The market shows considerable improvement in dressed; but there is no call for heavy receipts. Much of the trade depends upon city killers.

Turkeys, Phila. prime ₱ lb 16@18c.; State & Western d. p. 16@17c.; scalded 15@16c. Chickens, Phila. prime 18@20c; N. J. & Bucks Co, 17@18c; State & W'tn sp'g 15 @17c, Fowls, Phila. d. p. 15@16c. Bucks Co. 14@15c; N. J. d. p. prime 14@15c; do. scalded 13@14c.; State and Western d.-p. prime 14@14½c.; do. scalded prime 13@13¾; do. coarse 12@12½c. Ducks—Spring, Phila, ₱ lb. 16@18c; J'y & Bucks Co, 15@16c. State 14@16c; old, fair to good 12@13c. Squabs, white ₱ doz. $2; do. dark, $1.25@1.50.

Live fowls have very unsettled prices according to supply and at the moment they are on the high scale. Chickens easy.

Chickens J'y Spring ₱ lb 15½@16½c.; State and 15@16c spring western and southern 14@15c. Fowls, J'y, State and Pa. 13@14c; western 13c. southern 13c; roosters, old 6@7c.; turkeys, Jersey & Pa. 14@15c.; western 13@14c; ducks, Jersey, N. Y. and Pa. ₱ pair 60@$1; western 55@65c. spring 75c@$1 geese, Jersey $1.50@1.75; J'y & Pa. $1.25@1.37; western mixed $1.12@1.25; pigeons, large strong birds 30@35c; young ₱ pair 20@25c.

Woodcock are selling promptly and are not plenty. Wild squabs from western shooting matches sell up to $1.50 ₱ doz. when prime, but slowly, being high in comparison with tame squabs. English snipe and plover dull. Black birds quoted at 25c read birds at 25@30c ₱ doz.

Woodcock ₱ pair $1@1.25; wild squabs, stall-fed ₱ doz. $1.25@1.50; Eng. snipe $1.75@2. plover $1.75@2.

PROVISIONS.—One week seems to be the counterpart of the other utterly. A strong speculative clinch holds the light supplies away from exporters; and for that matter local consumption is very much restricted as well.

Pork extra prime, ₱ bbl. $14@14.50; Western mess, new, $17.75@18. Lard, steam Western ₱ 100 lbs, $11.50 @11.60; prime city, $11 40@11.45. Hams, smoked city ₱ lb 12@12½c; pickled Western and city 10¾@11¾c; Shoulders: smoked city, 8¾@8¾; pickled, 7¾@7¾; rib bellies pickled, 9¾@10¾ Bacon, long clear, west. 9¾c. Beef, western mess, ₱ bbl., $10@3; India mess tcs. $27@29; beef hams bbls. $23@23.

Receipts for week—Beef, bbls and tcs. 1,339; pork, bbls. 4,849; Cut meats, pkgs. 22,544; lard, do 11,781. Exports—Beef, bbls and tcs. 2,706 pork, 2,263; cut meats lbs. 6,433,455; lard, do. 2,374,832.

SALT—For a week lots the demand is moderately active and prices firm. Quotations are—

Ashton's $2.50. Higgins's $2.40; Holmes's extra sifted $2.40. Deakins's $1.25 Evans's $1.20 Washington's $1.25; Marshall's $1.20; Verden's $1 20, Worthington's $1.20; Mediterranean 25c.

SEED—Clover seed is quiet; quoted at 7¼@8c. Linseed is dull; quoted at $1.85. Timothy has a small demand; quoted at $2.80@2.90. Flaxseed is firm and in demand; quoted at $1.28½@1.30 to arrive.

SUGAR.—Refined is held firmly with a very good demand.

Cut loaf ₱ lb 10¾@10¾c.; crushed 10¼@10⅜c.; powdered 10¼@c.; granulated 9⅜c.; mould A, 9¾c.; confectioners' "A" 9⅜c.; standard "A" 9¼c.; off "A" 8¾@9⅛c; white extra "C" 8¾@8¾c; yellow extra "C" 8@8⅜c.; "C" 7⅝@7¾c; yellows 6¾@7⅛c.

TOBACCO.—A large sale of hhds has occurred for Spain; market now quiet, Seed leaf in good demand,

I. ₱ 100, bchs $1.50@2; onions, potato prime ₱ bbl. $4.25@4 50; fair to good $3.50@4. lettuce Chester $3; carrots ₱ 100 bchs $1.25@1 50; okra ₱ 100 15c.

WOOL.—The stock is quite large. Manufacturers are holding off for more favorable figures. Many holders express confidence in the near-by later markets and would rather hold than shade.

LIVE STOCK MARKETS.

NEW YORK Saturday Aug. 6, 1881.

BEEVES.—Receipts for the week 12,238 head; do last week 12,456 do. The arrivals have been liberal all the week, and the weather the past three days has been extremely hot, and there was no disposition this morning to buy cattle ahead of immediate wants. Prices were irregular. The sales at both market places yesterday included 352 Texans at 7¼c and 50c. ₱ head to 8c. to dress 55 lb, and 356 Colorados at 8¾@9¾c. to dress 59@56 lb. There was a miscellaneous assortment of native cattle from the West which took the wide range of 8¾@11¾c. to dress 55@ 57 lb. and a load of poor Mich. oxen sold at 7@8¾c. to dress 64@65 lb. The week as a whole has been unsatisfactory for both drovers and butchers.

SWINE.—Receipts for the week 17,573 head; do. last week 19,017 do. Market very firm; 6¾@7c, quoted, city dressed Western 8¾@8¾c.; N. J. fine 8¾@9¾c. City demand for light pork good.

SHEEP AND LAMBS.—Receipts for the week 37,519 head; do. last week 34,525 do. The market generally was very dull. A few prime lambs were sold at fair prices, but every other class of stock was hard to sell at the low figures current yesterday. An exporter bought 100 prime Kentucky wethers at 6c, and some out of town butchers paid 5¾c, for several small lots, but most sales of sheep were at 4@ 5c, A car-load of Kentucky cull lambs sold down to 4c, and a few choice up to 7c' two cars of Va & Pa. do at 5@5¾c; two of Canada do, at 7¼c; three cars of State do. at 6¾@7¾c, and 10 head of Lower Jersey do, at 7¾c.

VEAL CALVES.—Hot weather has checked the market trade and small meats have had their share of neglect; common calves, fed or other, dull.

Live N. J. prime to choice, 7½c: do, state, 7¼c. poor to good 5@6¾c.; Mt. Hollys, 6@7¾c.; buttermilk, 5¾c.; grass 2¾@3c.

MILCH COWS.—Receipts are quite liberal and there is an easy feeling. The selling range has been $30@55 per head common to good. Fancy wants are apt to be filled by orders.

In cans. Sold at a reasonable price.

The Horsford Almanac and Cook Book sent free.

Rumford Chemical Works, Providence, R. I.

H. M. ANTHONY, 100 & 102 Reade St., N. Y.

PYRETHRUM Cinerariæ Folium,

THE GREAT CALIFORNIA INSECT-DESTROYING PLANT.

This celebrated plant has been pronounced unequaled as to its value and efficacy by any other production ever introduced on the American continent. Its growth and general use will eventually destroy all noxious vermin which infest the dwellings and persons of men and the domestic animals, as well as the insects which create such havoc with the products of the soil and of human industry.

Among the eminent scientists who have given the Pyrethrum exhaustive and thorough examination and trial may be named Prof. C. V. Riley, Chief of the United States Entomological Commission, and Prof. S. Henry Comstock, of the Agricultural Department, Washington, D. C.; Prof. A. J. Cook, Agricultural College, Lansing, Mich., and Prof. E. W. Hilgard, State University, Berkeley, Cal., all of whom unite in declaring it superior and infinitely surer and safer than any other insecticide ever offered to the public.

On receipt of $5 we will send a package of seed by mail to any address, with instructions for cultivating the wonderful plant from which our C. N. MILCO'S BUHACH CALIFORNIA INSECT POWDER is made. Each package will furnish plants for two or three acres. All orders for seeds must be sent to the

BUHACH PRODUCING AND MANUFACTURING COMPANY,
154 Levee Street, Stockton, California.
J. D. PETERS, Secretary.

200 CAR-LOADS LEACHED ASHES for sale. The best and cheapest fertilizer for farmers' use. See advertisement in this paper. JAMES HARTNESS, Detroit, Mich.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

PERSONAL ITEMS.

The Baroness Burdett-Coutts and husband are coming to America in October.

Walt Whitman is in the city. He is busy at an edition of his complete poems in one volume to be out next winter. He is still a half-paralytic.

Miss Eliza M. Marshall has resigned as a teacher in the public schools of Portsmouth, N. H., after 45 years of uninterrupted service.

Brigham Young's brother, Joseph, recently died at Salt Lake, Utah, aged 84. He was born in Hopkinton, Mass, and had been with the Mormons since 1835.

Several pious women united in a week of prayer for rain at Eaton Rapids, not because there was a drought, but that it might spoil a track for horse racing.

Sitting Bull on his enforced tour along the borders of civilization is having a high old time. He sold his pipe to a relic hunter for $100, and he gets from $2 to $5 for his autograph.

Senator Ben H. Hill, of Georgia, has gone to one of the Virginia springs. He is reported to be getting along well since the operation upon his tongue, and can talk with very slight impediment.

Lord Napier of Magdala is in London. His tenure of office as Governor of Gibraltar will expire in October, when being 71, he will, according to the present regulations, be compelled to retire from the army.

George Barrow, who died lately, was noted for his labor as an agent of the British and Foreign Bible Society, a part of which was a translation of the New Testament into Chinese; also for his love of boxing and beer, in both of which he freely indulged.

Colonel John S. Mosby has given Washington friends to understand that he has no intention of returning at an early date, as heretofore reported, but will remain at his post. It is known that President Garfield was always a warm personal friend of Colonel Mosby.

The late Dean Stanley had that fine, keen appearance which marks a thoroughbred Englishman—the generous, half-pouting lip, the long nose, with wide, thin nostrils; the delicate, unnoticeable ear: the soft, silky, half curly hair; the intense, far-reaching eye.

Sir Frederick Roberts has been selected to represent the British army at the great autumn manœuvres this year in Hanover and Schleswig-Holstein. The General's march from Cabul to Candahar was a feat warmly admired in Germany.

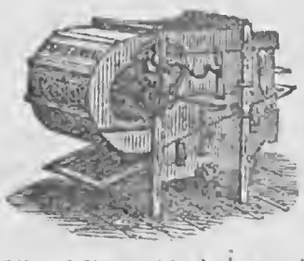
[Pittsburgh Catholic.]

Their Statements Indorsed.

A strong statement unqualifiedly indorsed must induce confidence. In this connection we note the following from Dr. Louis Bock & Son, Sheboygan, Wis.: We have been handling St. Jacobs Oil and are pleased with the large demand. Hardly a day goes by without hearing from some one or another of our patrons having used it with entire satisfaction, saying it is the best thing they ever tried, and we join them in so saying.—*Adv.*

Implements and Machinery.

The "Centennial" Fanning Mill.



The best mill in the world. It separates Oats, Cockle, and all foul stuff from wheat. Is also a perfect cleaner of Flax, Timothy, Clover and all kinds of seeds. The great improvement over other mills is that it has two shoes. It is especially adapted for warehouse use. Send for Descriptive Circular and Price List.

Liberal discount to dealers. Address
FREEMAN & SON, Racine, Wis.

MACHINES SENT ON TRIAL. KENNETT SQUARE PA

BOLSTER SPRINGS FOR FARM WAGONS.
Made of Best Oil Tempered Steel.
The ONLY RELIABLE Bolster Spring in Use.

SIMPLE AND SATISFACTORY.

They save largely from wear and tear in every part of the Wagon. They remove all necessity for a Spring Seat. They convert a common Lumber Wagon into a Spring Wagon, making it equally comfortable for from one to twenty persons. They are admirably adapted to the wants of Fruit and Vegetable Growers. They are suited to all makes and sizes of Farm Wagons, and can be attached by any one. They make the cheapest and easiest riding Spring Wagon in the market. These Springs have been in practical use for over four years, and are a pronounced success. No Teamster or Farmer can afford to be without them. We want Agents everywhere. Send for description and prices, and mention this paper.

SEMPLE & BIRGE MFG. CO., ST. LOUIS, MO.

ST. JACOBS OIL
TRADE MARK.

THE GREAT
GERMAN REMEDY.
FOR
RHEUMATISM,
Neuralgia, Sciatica, Lumbago,
Backache, Soreness of the Chest, Gout, Quinsy, Sore Throat, Swellings and Sprains, Burns and Scalds, General Bodily Pains,
Tooth, Ear and Headache, Frosted Feet and Ears, and all other Pains and Aches.

No Preparation on earth equals ST. JACOBS OIL as a *safe, sure, simple* and *cheap* External Remedy. A trial entails but the comparatively trifling outlay of **50 Cents**, and every one suffering with pain can have cheap and positive proof of its claims.

Directions in Eleven Languages.

SOLD BY ALL DRUGGISTS AND DEALERS IN MEDICINE.

A. VOGELER & CO.,
Baltimore, Md., U. S. A.

TRADE KIDNEY-WORT MARK

THE ONLY MEDICINE
IN EITHER LIQUID OR DRY FORM
That Acts at the same time on
THE LIVER, THE BOWELS, AND THE KIDNEYS.
WHY ARE WE SICK?
Because we allow these great organs to become clogged or torpid, and poisonous humors are therefore forced into the blood that should be expelled naturally.
KIDNEY-WORT
WILL SURELY CURE
KIDNEY DISEASES,
LIVER COMPLAINTS,
PILES, CONSTIPATION, URINARY DISEASES, FEMALE WEAKNESSES, AND NERVOUS DISORDERS,
by causing free action of these organs and restoring their power to throw off disease.
Why suffer Bilious pains and aches?
Why tormented with Piles, Constipation?
Why frightened over disordered Kidneys?
Why endure nervous or sick headaches?
Use KIDNEY-WORT *and rejoice in health.*
It is put up in **Dry Vegetable Form**, in tin cans one package of which makes six quarts of medicine. Also in **Liquid Form, very Concentrated**, for those that cannot readily prepare it.
It acts with equal efficiency in either form.
GET IT OF YOUR DRUGGIST. PRICE, $1.00
WELLS, RICHARDSON & Co., Prop's,
(Will send the dry post-paid.) BURLINGTON, VT.

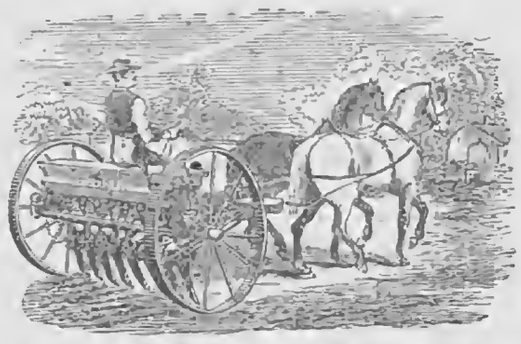
The New Buckeye Force Feed

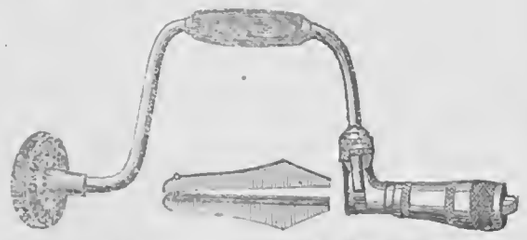


GRAIN DRILL.
ALSO
THE NEW BUCKEYE
Combined Force Feed Grain and
FERTILIZER DRILL.
AS IMPROVED FOR 1881.
Over 100,000 Now In Use.

The Buckeye has the largest sale of any Grain Drill in the world, and they are pronounced by all to be the most *perfect* SEEDING MACHINES in the country. No Grain Drill ever made gave such UNIVERSAL SATISFACTION. It is the best force-feed in the market. Our Fertilizer Sower has a positive force-feed and has no equal. Send for our circular giving illustrations of new improvements. Address P. P. MAST & Co.,
Springfield, Ohio.

Branch Offices, 216 N. Broad St., Philadelphia, Pa.
11th St. and Clarke Ave., St. Louis, Mo.

Also manufacturers of Buckeye Broadcast Seeders, Buckeye 11-foot Sowers, Buckeye Riding Cultivators, Buckeye Walking Cultivators, Buckeye Plow Sulky and Buckeye Cider Mill.



BARBER BIT BRACE.

Hereafter every Bit Brace found in any market with jaws as shown in the above cut, and bearing our name, will be made of Rolled Steel and heavily Nickel Plated. The Head is of Lignumvitæ, and the revolving Hand piece of Rosewood. The Jaws are of forged and tempered Steel, and will adapt themselves to any shape tool tang, round, square or flat, and hold it perfectly without any fitting. When made with a Ratchet Attachment it will bore in places where there is not room to revolve the Sweep; a slight back and forth motion driving the bit in or out. We formerly used Iron Jaws, which wore out. All such we will now replace with Steel, sending them by mail prepaid on receipt of 25 cents. They are all one size and will fit any Brace which we ever made. Our Braces are for sale by nearly all Hardware Dealers. Those who do not have them in stock will furnish them if requested. Price from $1.75 to $3.25 each. Many Braces are sold for less money; but this is the only Steel Brace in market; and one of them is worth six of any other kind. Save this notice as it may not appear again.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XL.—No. 1647.} NEW YORK, AUG. 20, 1881. {PRICE FIVE CENTS $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Biographical.

OUR PORTRAIT GALLERY.

John Bennet Lawes, LL. D., F. R. S.

JOHN BENNET LAWES was born in 1814, and on the death of his father, in 1822, succeeded to the estate of Rothamsted, Hertfordshire. He was educated at Eton and at Brasenose College, Oxford, where he remained from 1832 to 1835, and afterwards he spent some time in London for the purpose of the further study of chemistry, to which he had devoted much attention at the University. In October, 1834, he took possession of his property at Rothamsted, and at once instituted experiments in agricultural chemistry. He studied with great interest the researches of De Saussure on vegetation, and sought to apply his scientific knowledge to the solution of questions affecting practical agriculture. Among other subjects, his friend and neighbor, the then Lord Dacre, particularly directed his attention to the fact that while bones proved a highly valuable manure on some lands, they were quite, or almost, useless on others. To test this and other subjects several hundred experiments were made, some upon various crops in the field and others with plants grown in pots, and in these experiments the constituents found in the ashes of plants, as well as others, were supplied in various states of combination. Of all the experiments so made, those in which the neutral phosphate of lime in bones, bone-ash and apatite was rendered soluble by means of sulphuric acid and the mixture applied to root crops, gave the most striking results. Those obtained on a small scale in 1837, 1838 and 1839 were such as to lead to more extensive trials in the field in 1840 and 1841 and subsequently. Early in 1842, as one of the results of his investigations, Mr. Lawes took out a patent for the manufacture of the manure now known as superphosphate of lime. Before the publication of Baron Liebig's works in 1840, but little attention was given anywhere to agricultural chemistry, and many of the terms now in common use found no place in agricultural works published before that date. In 1843 Mr. Lawes established large works in the neighborhood of London for the manufacture of the new fertilizer according to the process covered by his patent, and when, shortly afterwards, vast deposits of mineral phosphates were discovered, the business of converting them into superphosphates attained vast proportions: nine years ago, when Mr. Lawes discontinued his connection with the works he had established, the amount of superphosphates manufactured there alone was upwards of 40,000 tons annually.

For some years Mr. Lawes had been aided in his investigations by a young chemist, Mr. Dobson; but in 1843 he secured the valuable services of Dr. Joseph Henry Gilbert, then 26 years old, who has ever since had charge of the laboratory department, and so closely have the two been associated that the name of one has almost become a complement to that of the other. The scope of the investigations was now so greatly enlarged and systematized that the foundation of the Rothamsted Experiment Station may be said to date from that time. The problem to be solved was to determine, by exact experiments, the principles, chemical and physiological, which are involved in the general and fundamental processes of successful agriculture; in other words, to determine the actual relation of various crops with the soil in which they are sown and with the fertilizers used to promote that growth, and to do this on so extensive a scale, both as regards time and area, as to settle upon a definite basis the fundamental principles of agricultural practice.

The investigations have chiefly embraced researches, 1, into the exhaustion of soil, including experiments on wheat, barley, oats, potatoes, clover, root and leguminous crops; 2, on the principles of rotation and fallow; 3, on the mixed herbage of grass lands; 4, on the process of vegetation generally, including researches on the action of manures; 5, on the origin of nitrogen in plants; 6, on the feeding and fattening of animals; 7, on rainfall and drainage; 8, various supplementary investigations, such as extensive researches into the application of town sewerage to crops, especially to grasses; the chemistry of the malting process, etc., etc.

In systematically undertaking the experiments in 1843, fourteen acres, divided into about twenty plots were devoted to wheat; seven acres divided into about twenty-five plots to experiment with turnips; subsequently as the number of plots experimented upon increased, the area devoted to the work steadily grew larger. The number of assistants and other helps has also increased from time to time. At first only one laboratory man was employed; but very soon a chemical assistant was necessary and next a computer and record-keeper. During the last twenty-five years the staff has consisted of one or two or sometimes three chemists; two or three general assistants whose principal occupation is to superintend the field experiments; an occasional botanical assistant with from three to six boys under him; a varying number of laborers always employed in field and other work; two or three (lately always three) computers and record-keepers for calculating and tabulating field, feeding and laboratory results, copying, etc., and one, and sometimes two, laboratory men. Besides the permanent laboratory staff under Dr. Gilbert, chemical assistance is frequently engaged in London and elsewhere; and in this way Mr. R. Richter of Berlin has, for some years, been almost constantly engaged in analytical work sent from Rothamsted. Professor Way, Prof. Frankland, Professor Voelcker and the late Dr. Pugh have also done a great deal of work for the Station.

Rothamsted is an entailed estate of over 1,000 acres situated twenty-five miles from London on the Midland Railway, near Harpenden Station. The house is a battlemented mansion built of brick in the Tudor style of architecture. The oldest part was erected four hundred years ago, in the reign of Edward IV.; but extensive additions were made to it in the days of James I., and still more in modern times. In 1878 we presented to our readers a likeness of Mr. Lawes, which was not satisfactory, and accordingly we have engraved the present one from a photograph lately received from the benevolent owner of Rothamsted. The RURAL NEW-YORKER is the first American journal to which he has contributed frequently, and for the interest of agriculture we are glad to see that our American journals are now pressing him for his valued communications.

At the beginning of the association of Mr. Lawes and Dr. Gilbert an old barn was fitted up for a laboratory, but as the range of investigation extended this proved insufficient. About 1854 the farmers of England subscribed a considerable sum as a testimonial to Mr. Lawes for the service he had rendered to British agriculture, and it was proposed to expend the amount in plate; but at his suggestion it was devoted instead to the construction of a new and more commodious laboratory, which has enabled him to extend his inquiries for the benefit of those who thus honored themselves by their grateful recognition of his eminent services. In the same year he was elected a Fellow of the Royal Society, and in 1867 the Royal Medal was awarded to him conjointly with Dr. Gilbert by the Council of the Society.

During the whole period of its existence the Experiment Station has been completely disconnected from any external organization, and has been maintained entirely by Mr. Lawes. His object all along has been, not to put money into his own pocket, but to afford the farmers of the United Kingdom, aye, and of the whole civilized world, information by which they may be able to put money into theirs. For upwards of 40 years this philanthropic object has been sought by a series of experiments conducted with a skill, perseverance and success which, in the words of Sir Edward Sabine, President of the Royal Society, "have placed their authors, by general consent, at the head of all those who have pursued this important branch of experimental inquiry." When investigations such as these have occupied one's attention for many years, he is led to regard them, as Dr. Lawes remarks, in some way as his children, which he is unwilling to desert or leave destitute at the time of his death. Acting on this principle, Mr. Lawes has set apart a sum of $500 000 and a sufficient area of land for the continuance of his life-work after an honored memory of him alone and the lasting results of his labors shall remain among the living.

It is impossible in the compass of this short sketch even to outline the practical conclusions arrived at from a series of investigations upon so many subjects, each so complicated in its nature, so important in its object and continued systematically over so protracted a period. A great deal of the results of his labors from 1843 to the present time has been given to the public through various English agricultural and scientific periodicals as well as in official reports, while of late years, as those who have had the advantage of reading his prized contributions in our columns are aware, he

JOHN BENNET LAWES.—From a Photograph.—Fig. 406.

has also given much valuable experience and information directly to the people of this country. Indeed, it is doubtful whether within the last quarter of a century a single standard work relating to agriculture has been published in which references are not specifically made to his experiments; and certain it is that in that time not only has no valuable work of the kind been published, but that no valuable number of an agricultural periodical has been issued which did not derive a fair share of its best information from the scientific and practical lessons taught by the investigations at Rothamsted.

Horticultural.

CRUDALISMS

THE question in regard to potatoes "mixing in the hill" is again undergoing discussion. *How* they do or can mix in the hill has not yet been explained in a manner that can be accepted as in the least satisfactory. I will mention a fact that may serve to throw some light on the subject. Many years ago I grew an acre or so of the Early Dykeman Potato, now almost forgotten. The drills were opened with a double mold-board plow, and, as an experiment, *horn* shavings or turnings were sprinkled in the drills before the potatoes were covered, the latter operation being done with a drag. When the potatoes were dug I noticed that many of them were highly colored with pink or red, some more and some less. This might have passed for a case of "mixing in the hill;" but a little examination showed conclusively that the coloring had been done by the horn shavings, the impression or form of single shavings being very distinct in many cases. I have noticed something similar many times since, but I have never seen anything that could be called mixing in the hill. Those Dykeman potatoes were Dykemans still, and nothing else. Artificial manures or substances already in the soil may change the color or outward appearance of the potato, but its specific character remains the same. When a white-skinned and a red-skinned potato are put in the same hill, the white one may show some change of color, as in the case of the horn shavings; but no change occurs in the potato itself. As a rule, there can be no change except through the medium of seed. What is called a "sport" does not come under the head of "mixing."

I MET in the cars lately a gentleman with a fine flower (closed) of Cereus triangularis. I admired it, and then remarked, "This is a very fine specimen of triangularis," to which he replied, "Oh no; this is the Lily of the Night." A lady friend, who has a very fine plant of Cereus McDonaldi, calls it the Queen of the Night; a very pretty name for that grand flower.

JUDGING from what I have seen of the Taylor Blackberry, I should say it was quite as productive as the Snyder and equally hardy. The fruit is larger, not quite so sweet, but more juicy and better flavored. It is later than the Snyder. They are sufficiently distinct to prevent any further suggestions that they are identical. The Taylor would seem to have a prosperous future before it. I had an unusually fine specimen of the Ameden Peach which ought to be made over again into a free-stone. Pears are abundant. Melons are very backward, and might ripen a good crop next Summer if they could be wintered over. And so I might go on and name a good many other things; but time is short, and so is this column.

I AM glad to see Mr. Mason's criticisms on the flat culture of corn. Discussion will only be the more certain to bring out its merits. He says, "Hilling up is necessary in heavy, solid clay soils, as the only mode of letting the sun's heat down into the cold soil around the corn roots. On such soils flat cultivation would not answer." Again, "Flat culture is suitable to sandy land, as that is warmer than clay." I do not agree with Mr. Mason's premise or his deductions on this point; but there are no arguments so convincing as good solid facts. Westchester Co., N. Y., as a rule, is only moderately heavy, and I will let it pass. Portions of New Jersey are heavy enough, and flat culture does well there. In fact, I know of about a hundred acres of corn and potatoes now growing on a clay so heavy that it becomes as hard as a rock when dry, or rather did before it was underdrained. Both the corn and the potatoes are grown flat, and the corn looks as well as any I have seen. The soil, as I said, is underdrained; and this is what Mr. Mason ought to do instead of hilling up. The RURAL will hear from the owner of these crops at the proper time. But let us go up into Orange Co. N.Y., where the soil is heavy enough and where flat culture is pursued with results entirely satisfactory, not on half-acre lots, as Mr. Mason seems to think, but on 50 and 100-acre lots. I ought, in fairness, to state most Orange Co. farmers fully understand the advantages of underdraining. Let us, again, go up into Columbia Co., N. Y., noted for its remarkably stiff clay, and we find flat culture to do exceedingly well there. In these heavy clays, where the surface is kept flat and well pulverized, corn sustains a drought without injury much longer than where it is hilled up. And all this, as it seems to me, for very good reasons. Mr. Mason further says, "Hilling does not support the plant, and I never heard any one say he thought so." His experience on this point has been very different from mine. I have been "agitating" the question of flat culture for upward of 30 years. I have written about it, and talked about it at Farmers' Clubs and at meetings of horticultural societies, and have always been met by the argument that corn will blow down unless it is hilled up, and I should feel warranted in saying that at least 80 per cent. of those who hill up corn do it for this reason alone, not thinking of any other. There are other points which I will notice hereafter. The space to which I am limited is already full, and I will only add, that Mr. Mason is evidently a man of so much intelligence that he can well afford to do without that common, ponderous but weak argument of throwing a five or ten thousand acre lump of Western soil at our poor Eastern heads. The laws of plant life and plant growth in a one-acre lot and a thousand-acre lot are the same, whether on Long Island, in New York, or in Nebraska, and hence it is the RURAL is prized as much in the West as in any other part of the U. S. The principles of economy in cultivation are not yet fully established, and may be profitably discussed for years to come. HORTICOLA.

EARLE'S BERRY BOX.

A GIFT BERRY BOX, to be given away with the fruit, has been demanded more or less frequently during the last 10 or 15 years. When at the Messrs. Hales' last month I was shown a box designed for this special purpose, which, with some slight alterations, comes nearer my idea of "filling the bill" than anything I have yet seen. It is very simple, and ought to be cheaply constructed. It consists of three pieces only:—First, a piece of sufficient length and breadth to form the bottom and ends; second, one for the sides, going all round the

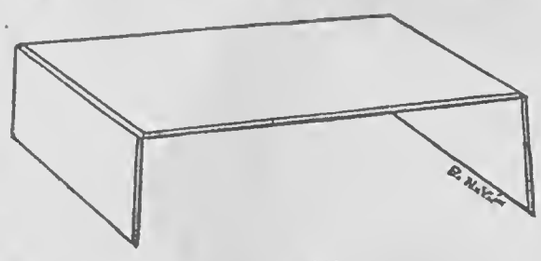

FIG. 407.

box, lapping on one side and tacked together, also tacked to the small ends forming the bottom, thus stiffening and holding them in place; third, a top-piece the wings of which pass down over the ends and between them and the sides, holding and stiffening the whole structure. The ends rise above the sides sufficiently to allow the berries to be rounded up and to hold the top off of them, affording ample ventilation. The illustrations, 407 and 408, will make this brief description readily understood.

These boxes pack closely and help to support each other, and if the demand should warrant their use, the only obstacle in the way would seem to be their cost. If this can be sufficiently low, and yet secure a good article, it will be a great relief to berry growers, saving them the trouble of sorting, cleaning, and using all sorts of dirty and dilapidated baskets

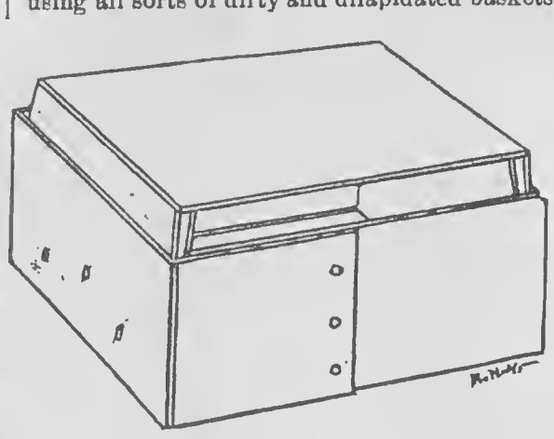

FIG. 408.

that are invariably returned to them, and purchasers will have the satisfaction of having their fruit in clean packages. The crates, not having to wait for the empty baskets, can also be more promptly returned—often quite an important consideration. This box is the invention of W. H. Earle, of Worcester, Mass., a practical fruit grower, and is what might be expected from a practical man who knows just what he wants. The great fault with inventors generally is that they are more theoretical than practical. E. WILLIAMS.

Entomological.

THE CLOVER-LEAF MIDGE.

IN the report of the Entomologist to the Commissioner of Agriculture for the year 1879, Prof. Comstock speaks of this little insect as being found in considerable numbers infesting the White Clover (Trifolium repens) on the Department grounds at Washington, but says he had not seen it elsewhere. Since my attention was called to it, I have carefully examined the clover, both white and red, in several places in Southern Illinois, but do not

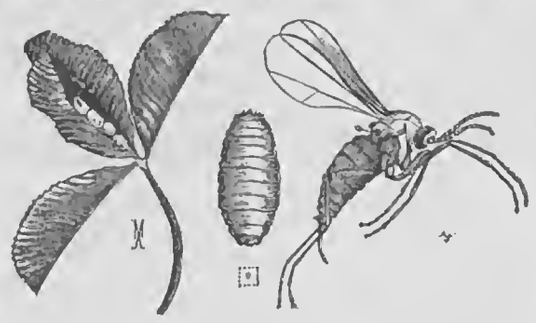

FIG. 409.

find anything of the kind in this locality. As Loew found this species in Europe, the probability is that it is another of our importations from the Old Country, especially as it seems to be found in only one locality in this country; and it appears quite probable that it has been brought over in hay that has been used in packing some articles brought to Washington. On the other hand, as Loew found his insect feeding only on Red Clover (Trifolium pratense) instead of White Clover, future investigation may prove the European one and ours to be specifically distinct, though this is not very probable, as the two food plants are so nearly alike. If we have here a new importation, it would be well if it could be totally destroyed before it spreads over the country.

Prof. Comstock's description of this midge (Cecidomyia trifolii) is substantially this: About the middle of June the leaflets of White Clover may be seen folded upwards and fastened together something like a small pod. Inside of these would be found from one to twenty small, pale, orange-colored maggots about .06 of an inch in length. These little worms live in this leafy inclosure, appropriating the juices of the leaf very much as the Hessian Fly maggots (Cecidomyia destructor), an allied species, do the juices from the stalks of wheat, and with the same effect to the plants.

The figure accompanying this gives an idea of the insect in its different stages as well as of the way the leaves are folded. To the right is the perfect insect that deposits the eggs; in the middle a larva, both magnified; on the left a leaf, two of the leaflets folded and the middle one opened to show the larvæ or pupæ inside. The perfect insect or fly is smaller than its relative, the Hessian Fly; but resembles it somewhat in shape, as may be seen by comparing the figure here with one of that insect. In color this is brown, while the Hessian Fly is black. As Prof. Comstock reports the flies appearing in June, there are probably two broods of them in a season.

Carbondale, Ill. PROF. G. H. FRENCH.

TWO GRASS INSECTS.

BESIDES the Army-worm (Leucania unipuncta) and the Wheat-head Army-worm (L. Harveyi), there are two other larvæ of Leucania that are known to be grass-eating insects.

Because they occur in smaller numbers than the first mentioned insects, they are not so destructive, and, as a natural result, they have not come so prominently into notice. I find, however, that the moths are pretty widely distributed, and as they must be destructive in proportion to their numbers, I will give a brief description of them here.

The first of these, Leucania Phragmitidicola, I have found a number of times in clumps of grass. It is a lighter-colored caterpillar than the Army-worm, the general color being light gray. When full-grown it is an inch and a quarter long, rather robust. Along the back is a fine, light line and a distinct dark brown line about midway from this to the breathing pores. Between these two lines are several fine, brown lines that scarcely interfere with the general color. Just below the breathing pores is a flesh-colored line. Between this and the dark brown line are three pale brown lines and three pale buff lines.

From this description one may easily distinguish this caterpillar from its darker relative, the Army-worm. In eating it crawls upon the stems and blades of grass and feeds like the Army-worm, but it hides itself mostly at the roots of the grass during the day-time and feeds at night.

The other caterpillar, Leucania Pseudargyria, is found in similar situations, but is more slender in build and differs in color from the first. It is somewhat smaller, being only about an inch long when full-grown. In color it is a fleshy-brown, rather light, sprinkled over with fine dark-brown dots, only seen distinctly with a pocket lens. These dots form two rather broad stripes along the back and another along the sides, each one being very indistinctly divided in the middle as though it were two lines. The stripe along the sides is the lightest. The stripes along the back are darker in some parts than in others, making a faint V on each joint, the angle turned back. The head is gray, mottled with brown, but the top of the neck is dark brown.

The moth that the first of these caterpillars produces has light gray fore wings with a dark mark through the center and white along the veins. It resembles the Wheat-head Army-worm moth, but is lighter. The moth of the second species resembles more the Army-worm moth, though while the fore wings of the Army-worm moth are somewhat fawn-colored, these are drab with a row of black or dark brown dots near the outer end and a single larger black dot at the base of each fore wing. The hind wings are quite dark.

It is possible these may not become sufficiently numerous to be troublesome, and, in that case, the above is merely a contribution to the knowledge of our grass-eating insects. If they should be troublesome I doubt not that the same remedies that are used for the Army-worms would be effectual with these.

Carbondale, Ill. G. H. F.

A Colorado Beetle Catcher.

By using the bug catcher illustrated by the accompanying drawing, two persons can gather bugs very rapidly without stooping over the vines. It is a light frame eighteen inches wide and four feet long, including the handles. A piece of cloth is tacked over the frame, not tightly, but loosely enough to allow it to sag considerably and form a receptacle

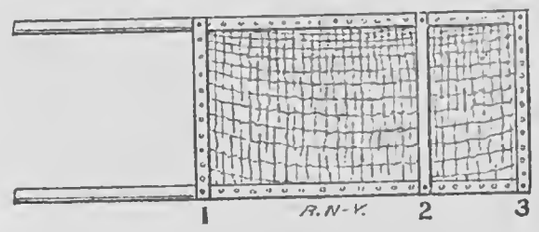

FIG. 410.

for the bugs near the lower end. One person holds the trap as near the vines as possible, while another, on the other side of the row, bends the vines over with an old broom, and shakes the bugs off. Cross-piece No. 2 is only for the vines to strike against in jarring off the bugs. The cloth is not fastened to this, but hangs loosely beneath it. A handful of dirt will hold the cloth steady when the wind blows. G. S.

Carroll City, Ia.

[Would it not be as well to use half of a shingle split lengthwise and cut narrow for a handle with which to strike the vines, thus *throwing* the beetles or grubs into the bag? We have found that rapid and effectual work may be done in this way.—EDS.]

HANDY "BUG-CATCHER."—W. J., of Godfrey, Michigan, referring to the illustrations of the above device, on page 501 of the RURAL, says that a little coal oil in the pan will prevent the bugs, once they get in it, from crawling up the sides.

Field Crops.

WHY BLUE-GRASS IS SO-CALLED.

PROFESSOR F. H. STORER.

THE question has repeatedly been asked by Northern farmers why the Kentuckians call Poa pratensis "Blue-Grass;" in the same sense that your Pennsylvanian correspondent, W. G. W., inquired in a recent number of the RURAL: "But why do you call it 'blue" when it is so intensely green—the greenest of our grasses?"

I am inclined to believe that the explanation of the matter really depends upon some superiority of the soil, and perhaps of the climate, of the Middle States, in respect to this particular grass. For, even in Massachusetts, I have observed that when Poa pratensis is grown under exceptionally favorable conditions its blossoms have a well-marked purple color such as would not unnaturally be called blue by persons unaccustomed to discriminate carefully in respect to tints and shades. In one particular experiment, for example, which I made a few years since here at the Bussey Institution, a quarter-acre plot was staked out in the middle of a poor old mowing field the sod of which consisted largely of Poa pratensis,—"June Grass" as we call it in this vicinity—and upon this plot a variety of chemical fertilizers were scattered, in large

excess over and above what the grass conid possibly make use of. The resnlt was a vigorous stand of June Grass upon the manured plot, and when the time for blossoming came, there was a very decided and a very beautiful bnish-purple quarter-acre patch in the midst of the otherwise green field. The tall, purple plants were examined repeatedly and found to be really June-Grass (Poa pratensis), and not Wire-Grass (Poa compressa.) This experience naturally excited the interest of our students in the subject and led them to detect the same "blne" coloration in several small patches of June-Grass in different localities where the circumstances happened to be especially propitious for the growth of this plant.

As a matter of course, there must be somewhere in the world a best possible place for growing each and every particular plant—June-Grass, as well as the rest—and the mere fact that this grass presents such an appearance in Kentncky that the inhabitants of that State have been led to name it "blue," is evidence which goes to show that it is there doing if not its very best, why then at least as well as can be expected. In this special instance, indeed, there seems to be justification for a certain tendency towards "tall talk" which has sometimes been noticed as a peculiarity of the inhabitants of that ancient State.

MEADOW FESCUE—FESTUCA PRATENSIS.

Many of the fescnes have deservedly won a high reputation for the nutritious pastures and meadows which they afford. The species are much mixed and run into each other, or cross, in a way to puzzle the best botanists. Pratensis is gived as a mere variety of Festnca elatior, by Dr. Gray and others. This matters little at this time. There are several others growing at the Michigan Agricnltural College, which are as promising as the one above named, especially for the dry Western prairies. The leaves are rather firm in texture, long and flat. Meadow Fescne flowers in June to Angust. It comes from Europe and is not so often found in meadows as its merits deserve. I deem the best varieties of the fescues well worthy of careful experiments. Like Indian corn, they seem ready to break np into many permanent varieties. By careful selection and cultivation there is no telling what might not be produced.

It (Meadow Fescue) grows two feet high. Cattle are very fond of the green grass or the hay. The seeds are rather large and easily sowed. These are good qualities not to be overlooked, especially in countries subject to extremely dry weather. There is enough of seed to give the young plant a good start. Many of the seeds in market are imported and possess low vitality or none at all. They are often much mixed with seeds of Perennial Rye Grass and others. What is said of imported seeds of Meadow Fescue applies also to most other imported seeds of the grasses. More attempts should be made to grow them in the United States. Prof. W. J. Beal.

Mich. State Agr. College.

TOBACCO-GROWING NOTES.

Whenever, from the depredations of cutworms or other causes, vacant places are found in rows of tobacco after the proper season for transplanting has passed, it is well to occupy such vacancies by sowing in them turnip seed. Flat turnips will grow finely and yield good crops when grown in this way. The shade from the plants does not seem to injnre them when starting, and the tobacco is removed before their growth is completed.

There is a tendency with many tobacco growers to continue the work of setting plants after the proper season has passed. A plot of ground where some early crop has been removed is frequently planted with tobacco so late that the crop has not time to matnre before Autumn frosts. Such tobacco is rarely of good quality, because it does not have time to become sufficiently ripe, or, if left too long, it may be frost-bitten. A small amount of such a product may be "worked in" with a crop of good leaf without being discovered by the bnyer, but it is a fraudulent practice and is of the poorest policy. No tobacco farmer can afford to follow any practice that will injnre his reputation as a grower, for a good repntation is one of the chief requisites to success in tobacco culture.

There is no one thing that is more certain to injnre a crop of tobacco after it has commenced to grow in the field than neglect in the work of "worming." It is a slow and costly task to worm a crop of tobacco, and in the busy season when other work is crowding the farmer, it is, therefore, frequently neglected until great damage has been sustained. There is no perfect way of destroying the worms except to pick them off by hand one by one. A single worm after it has become of large size will sometimes completely destroy a large plant in a few days if allowed to follow its own course, and the utmost vigilance is always necessary to prevent the pests from greatly injuring a crop.

MEADOW FESCUE.—FIG. 411.

The tobacco plant-bed should not be forgotten at this season of the year. In order to keep it from becoming foul with weeds and weed seeds, it should be forked over as soon as the planting season has passed and covered with a liberal dressing of well-rotted manure. When the weeds begin to show themselves it should be forked over again, and this continued at intervals of from four to six weeks until the growing season is over. With this management no weeds can mature or scatter their seeds in the bed, and the frequent forking makes the soil in excellent condition for another crop of plants. Grass and weeds about the plant-bed should also be pulled or cut to prevent them from maturing and scattering their seeds, lest some of them become rooted in the beds.

MEADOW FESCUE—FESTUCA PRATENSIS.—FIG. 412.

Ingratitude of a Carefully Flayed Elephant.

The White Elephant was planted in April. It was very carefully peeled so that the potato could be eaten. Then the skin was cut into eight pieces and very carefully planted between two grape-vines so that the hills would be sure to have plenty of shade. I had Peerless planted on one side; Peachblow on the other; Pinkeyes on each end; Early Rose between, and Colebrook Seedlings in the middle. Then for better protection I had orange plants on one end; Japan Plums on the other; sweet potatoes on one side and okra and tomatoes on the other—and now, after all that care and trouble they only average one small potato to the hill. The W. E. is not worth a "red cent"—for this portion of Florida. N. K.

Archer, Florida, Aug. 2.

[We should hardly suppose that the eyes with the skin only for their support, could have done any better. We have tried the experiment of planting potato skins cut to single eyes, with results similar to our friend's, except that many of them failed to grow.—Eds.]

Farm Topics.

THE EVAPORATION OF FRUIT.—No. 2.

J. G. BINGHAM.

Its Advantages.

Since 1872 the business of fruit evaporation has made steady progress, annually absorbing more capital and receiving more general attention. Though the business is yet in its infancy, the evaporated products of the United States now amount to many millions of dollars annually, besides the fact that the entire fruit crop of the country is immensely enhanced in value on account of so much perishable fruit being withheld from the (otherwise overstocked) markets. Thoughtful observers have remarked during the past few years that the fruit evaporators have saved the fruit growers of the States from the disastrous effects of a broken-down and demoralized market. Whenever the point is reached that one-half the regular crop of fruits can be profitably cured at home, and thus withheld from the fresh fruits sent to market, then, and not till then, will the peach grower of the Peninsula or the fruit grower of the United States be reasonably sure that he is going to market his products at a profit instead of a loss, the latter being too often the case during a very fruitful season.

Particularly valuable to the peach grower is the economical industry of fruit evaporation. His fruit demands careful handling; slight bruises engender decay. Certain varieties, from their juicy, mellow nature, cannot be shipped to the city markets, and must be worked up at home. With a portable evaporator, like the Zimmerman, manufactured at Cincinnati, Ohio, or the American, of Chambersburg, Pa., either of which is perfectly adapted to his needs, he can, with proper help, place this perishable product beyond the possibility of loss. Evaporated peaches are always salable at good prices. This fruit probably gives the best returns for cost and labor bestowed upon the production of a first-class article. The supply never has been, probably never will be, such as to cause prices to fall below a profitable margin. Peaches now can be pared almost as readily as apples, and the commercial value of the pared over the unpared is an increase of 200 per cent. Pneumatic evaporation preserves the essential properties and saccharine richness of the peach. It turns out to be a process which not only forestalls decay, but carries out the organic process of ripening to an artificial perfection. In 1874 the total amount of American dried fruit exported was less than 1,500,000 pounds. In 1880 the exportations had increased to 2,000,000 pounds *per month*, notwithstanding the greatly increased consumption at home, owing to the superior quality of the product.

Few of the smaller fruits are exported, the foreign demand being chiefly for apples. In France the distillers are using large quantities of dried apples for the manufacture of brandy. The English market will take little except evaporated apples, and the demand is steadily increasing. The old custom of exchanging two pounds of domestic dried fruit for one of imported has been more than reversed. Even our wild raspberries and whortleberries, properly evaporated, stand at par with many of the far-fetched luxuries of Smyrna and Italy. One pound of evaporated peaches commands in our markets a value equivalent to three pounds of raisins, four of Zante currants, and five to eight of figs, prunes or dates. Current prices of all kinds of domestic evaporated fruits, rated on a specie basis, were higher in 1880 than ever before, with, perhaps, the exception of apples, which was due to the large stock of perishable fresh fruits—green apples—which crowded our markets. This, however, will only tend to open up new markets where they will be indefinitely retained, and increase the demand for evaporated apples in the future.

McGrawville, N. Y.

ENSILAGE, COTTON-SEED MEAL, ETC.

While on a visit recently to the Experimental Farm of Rutgers College at New Brunswick, N. J., we asked Superintendent West for his opinion on the ensilage question. He said they had 14 tons put into a silo for experiment, which was fed to three cows, but as it was put in at three different times, it did not seem to keep well. He saw no increase in amount of milk, and thought it gave the hair a dull appearance, denoting unfavorable effects of the ensilage fodder. He was not willing to give the system much praise, nor would he condemn it *in toto*.

An interesting experiment on the relative merits of cotton-seed meal and corn meal as feed for cows has also been tried at the College Farm. Again three cows were chosen which had been receiving about three pecks of brewers' grains per day. Six pounds of cotton-seed meal per day were given each cow for 10 days, and the quantity of milk taken was noted. After 10 days six pounds of corn meal were given with the same amount of brewers' grains, and on the tenth day of feeding the quantity of milk was found to have been increased nine and one-half pounds per cow. The corn meal was now withheld, when the quantity of milk was again reduced to the same amount as before feeding the corn meal. Cotton-seed meal costs two cents per day more than corn meal, which Mr. West considered quite an item in a dairy of 40 cows. He considers brewers' grains the best feed he can give his cows, and he has just siloed 150 tons.

HINTS AND SUGGESTIONS.

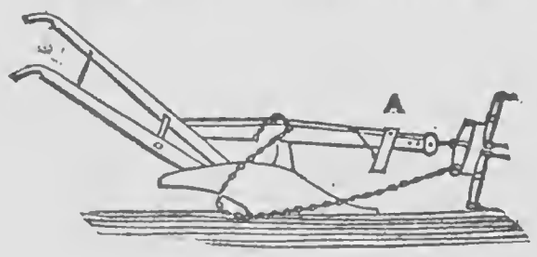
Watering Shade and Ornamental Trees.—Where irrigation of olive and orange trees is practiced in the south of Europe water is brought to the roots by punching three or four holes in the ground among the roots and then applying the water by the usual irrigation. The point of the bar being sharp and

FIG. 413.

smooth passes between the roots without injuring them, and the stream of water at its latter end carries down some soil and closes the hole. This renders it unnecessary to remove the mulch on the top soil, and H. A. P., who inquires (page 503) about this matter, will

find the plan very convenient and effective. A wooden bar, if of tough, hard material, may do, but an iron one is better. The lower end should be thickest (see Fig. 413). A bar of this kind will be useful for many other purposes, digging post-holes, etc.

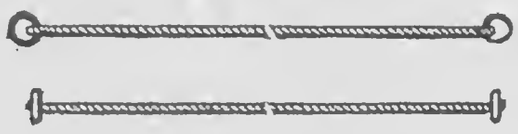
COVERING WEEDS WITH A PLOW. — One would suppose every man whose business is to plow, would know how to attach a chain for the purpose of covering weeds. But a hired man who claimed to know everything about farm work and who was set to plow a field containing some tall weeds, made wretched work because he had never heard of this method of covering the weeds. Many others, doubtless, are equally ignorant of this plan, which is so old as to be forgotten, and really new again. The chain is looped around the plow beam at the standard, as shown at Fig. 414. It is made to trail so that it is just in advance of the falling furrow and barely escapes being covered. The other end is fasten-



CHAIN ATTACHED. — FIG. 414.

ed to the double-tree, as shown; or it may be fastened to a bar bolted to the beam and braced, as shown at A. This should be known by every one whose business it is to handle a plow, and is specially useful just now when weedy stubbles or fallows are to be plowed for wheat.

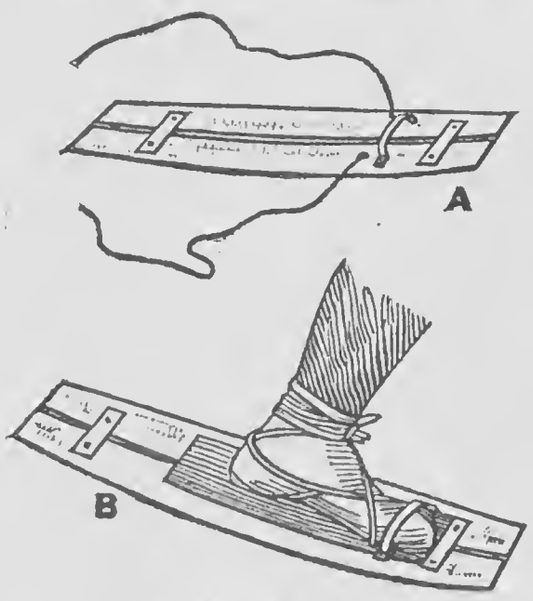
LAYING OUT FIELDS BY MEASURE — Few farmers know the size of their fields or how many acres they contain. A field of the writer's, before it came into his possession, had been plowed and reaped by contract for 15 acres. On measuring it, it was found to have but 12 acres. It is desirable, in fact, indispensable for good work, that a farmer should know how many acres each field contains, for otherwise he cannot apportion seed or manure for it, nor can he tell how much time it should require to be plowed. A measuring cord should be part of the furniture of every farm. To make one, procure 67 feet of



SECTIONS OF MEASURING ROPE.—415.

strong rope, one inch around: make a loop or fasten a ring or a bar at each end, and make these precisely 66 feet apart. This is four rods. Then tie a piece of red rag in the center. One acre of ground will be a piece four of the cords (chains) long and two and one-half wide, equal to 16x10 rods, making 160 square rods, or one acre. The arrangement of the rope is shown at Fig. 415. The advantage of the ring or loop, is that one person can measure alone by driving a stake in the ground to hold the rope while he stretches it out. The rope should be soaked in tar and dried, which will prevent it from shrinking when wet.

MOWING MARSHES.—Farmers having occasion to mow wet meadows or swamps, may keep their feet dry without going to the expense of buying rubber boots, which, besides being costly, are not very agreeable to work in for a whole day. Swamp shoes may be made as follows: two wide, strong, smooth staves of a flour barrel are fastened together, as at Fig, 416 A. A leather strap is passed through two holes in the forward part of the



MARSH SHOE.—FIG 416

shoe and two laces, or strings, are fixed there, as shown. A piece of carpet doubled, or leather, may be nailed on the shoe where the foot will rest. The foot may be wrapped in a piece of blanket, which is done by the Indians and white trappers when wearing snow-shoes. These pieces of blanket are called "neips." The neip is tied around the ankle and the trousers are gathered and tied over it. The toes are then put under the strap and the shoe is fastened to the foot so that it is attached only to the toes and the foot can move freely. As the person walks he lifts the foot and the shoe drags, with the hind part on the ground, the fore part being lifted, thus escaping any obstacle. A pair of light rubber or arctic overshoes may be worn. With these one can travel easily over the softest swamps. A shoe may also be cut out of a large cypress or cedar shingle, or a piece of thin board, but the curve of a flour barrel stave is just about right for this purpose. The foot strapped to to the shoe is shown at B, Fig. 416. The neip is fitted by placing the foot on it with a corner at the toe and one at the heel; it should be 18 inches square. The corner is turned down over the toe upon the foot; each side is then turned over the foot and then the hind part is brought up to the heel: this brings it about the ankles evenly and smoothly. Or the sides may be turned up first and then the heel and, lastly, the corner brought over the toe, which would in that case leave a thick cushion to come under the strap to protect the toes from chafing.

The Herdsman.

A SUCCESSFUL CATTLE FEEDER.

WALDO F. BROWN.

Profitable Cattle Feeding.

THE gentleman I referred to in my former article and who is entitled to the above appellation, is Mr. Samuel A. Deal, of McLean Co., Ill. Before giving, however, the figures which he gave me and which show how handsomely he was paid for his grain in his cattle feeding, I wish to point out some of the reasons why farmers so often fail to make cattle feeding profitable. One (where the cattle are bought) is from buying at the wrong time of year.

Perhaps the majority of farmers who intend to "winter feed," buy from pastures in the Fall, the last of October or first of November. Cattle at this season have a good deal of what the butchers call "gross" about them, and it will take extra care to make the transition from grass to dry feed without losing considerable weight. I think that ordinarily cattle will be found from 50 to 100 pounds lighter at Christmas than when they came off grass, and even if they are put on grain at once, it is doubtful if there is any gain during the first four or six weeks. Another cause of loss is from unwise feeding at the start. Cattle that have been on a bulky diet all Summer must be brought gradually to heavy grain feeding, and if they are over-fed a few times, so as to produce indigestion and derangement of the bowels, they will be permanently injured. My first experience with winter feeding was with six large steers, and as there was a rivalry between a neighbor and myself, I tried to push them from the start, and from subsequent experience I am sure that I would have made a greater gain if I had only fed half as much grain. Loss often comes from feeding too long. If the cattle are fed partly in the stables and finished off on grass, the time of profitable feeding can be lengthened, but for winter feeding I think about 100 days the profitable limit, and the first six weeks of this time the cattle should not be on full feed. It will pay the cattle feeder to weigh regularly that he may know just how his cattle are doing. The best results will follow from careful and regular feeding of mature cattle and a varied diet. All my experience favors a rather liberal use of bran, as it keeps the bowels regular and avoids the danger of indigestion and sours which the feeding of corn meal alone so often produces. If a steer on full feed will eat 12 pounds of grain and meal a day, I believe the best results will be had by giving two pounds of bran four of corn meal and six of whole corn; but I should not feed more than half this amount at the start.

But I will now give Mr. Deal's experience. In his letter to me in 1879 he stated that he had failed to make any money in feeding cattle bought in the Fall, and so concluded that year to try Spring feeding. With regard to his success that Spring I have merely these brief figures. He says, "I put 55 steers, averaging 1,010 pounds, in the feed lot on February 17; I fed them shock corn until turned on grass, and fed one peck each per day of ear corn in boxes while on pasture. I sold these cattle June 20, when they averaged 1,429 pounds, making an average gain of 419 pounds. These cattle ate 1,500 bushels of corn during this time, which made a fraction over 27 bushels each, which is less than a peck each per day, or, to be exact, three-fourteenths of a bushel."

In the Summer of 1880 I again wrote to Mr. Deal, and in reply he gave me the following facts: "I fed 64 head of cattle this year, beginning on light feed the first of February. My cattle were quite thin and averaged 1,000 pounds each, and were worth $3.50 per hundred or $35 per head. I kept them on light feed until the first of April, but from then until they were turned to grass I gave them all they would eat of shock corn. While on pasture I fed, as last year, one peck each of husked corn in boxes. I fed these cattle in all, 2,752 bushels of corn, worth 25 cents per bushel, making $688. I kept them considerably later this year, selling on Aug. 20, at $4.50 per hundred, and they averaged 1,536 pounds, or a gain of 536 pounds each, and the price per head was $69.12, or nearly double what they were worth when I began feeding them. Allowing $1.25 per month for pasturing and eight per cent. interest on the cost of them, there is left me a net profit of over $1,100, with which sum I am well satisfied. I expect to feed 90 head next Spring in the same way, for I find that to combine grass and grain feeding is the way to make cheap beef. Cattle will gain rapidly on grass alone; but they do not lay on as solid and lasting flesh and fat as when corn is fed with the grass, and in this way you can get your cattle in condition to bring the highest market price."

In all my experiments with cattle I have found Mr. Deal's method a profitable one, and I hope others will be helped by this statement as much as I have been.

HORNLESS vs. HORNED CATTLE.

READERS of the RURAL will soon be at the fairs looking over the different varieties of cattle, with a view of selecting the best breeds. In the discussions I have heard and read upon the merits of the various sorts, the question has been viewed in its economical and material aspects; there is undoubtedly another and a higher plane upon which it should also be discussed. I refer to its moral bearings, and the baneful influences that cattle-wearing horns exert upon the advancing civilization of the age. Man is very largely a creature of circumstances; his surroundings generally determine his intellectual and moral progress. Place him in a genial climate among pleasing surroundings, and he usually advances from generation to generation in the scale of civilization. Reverse those conditions, arm him with offensive and defensive weapons, and turn him loose, he becomes an aggressive and a fighting animal. Again disarm him, and place before him the choice of intellectual and moral pursuits, he again advances in civilization—[Because it may show that in our opinion no part of the human race has yet attained ideal perfection, therefore do we regret that we cannot coincide with our friend in the opinion that a genial climate and pleasing surroundings have on man an exceptionally civilizing influence. The inhabitants of the South Sea Islands had for generations a genial climate and unusually pleasant surroundings, but even before their exposure to the barbarizing influence of the less favored white man, their civilization certainly was not unusually high. The races that, within certain limits, have had to struggle hardest for a livelihood against natural inhospitality and for existence against human hostility, and that have had force and vitality enough to triumph most signally in both cases, have always become the most civilized—the best fighters have always attained the highest civilization. Let any people once lose the disposition to fight when needful, and the capability of doing so strenuously, and they soon sink into effeminacy, immorality, impotence and deserved contempt.—EDS.] It is right here that the question of horns upon our domestic cattle has its moral bearings. Horns are unquestionably both offensively and defensively deadly weapons. There is a question in my mind whether or not the first pair of cattle were so armed. I should say, from what we are taught in the Bible, that cattle were created hornless; certainly from what we conceive as a moral plan of the universe, they did not originally need such defensive weapons, but when the world went to the bad, and turned savage, they would be needed, and perhaps evolved out of the need for them amidst their evil surroundings. Be this as it may, we cannot now determine the question.

Wars and warfare in all time, and among all people have ever been demoralizing; the bad habit of carrying deadly weapons was, and is, a relic of this warfare and savagery. Contrast the moral condition of our remote border settlements with that of the older settled communities; those living in the former carry arms, and there both life and property are uncertain. The inhabitants of the other walk unarmed amidst peaceful scenes of quiet and plenty. Our domestic animals should imitate these contrasted conditions. Hornless cattle are peaceful, and quiet in their habits; they cannot, if they desire, injure and mutilate their own or the human race. We are never required to "take the bull by the horns" if he has no horns; there is no opportunity for such dangerous encounters; therefore animal is precisely like human nature in this respect—armed, it wants to fight, domestication does not, and cannot eradicate the disposition; but disarm it, and it grows more and more peaceful.

Suffering our cattle to wear horns is a good deal like permitting such men as Guiteau to go at large, and assassinate at will whomsoever they may take it into their disorderly heads to kill. There is no telling whether a bull is safe or not, or at what moment he may conceive himself aggrieved, and become an aggressor; even the gentlest cows commit both intentional and unintentional assaults, and become wonderfully ingenious and mischievous in opening granary doors and garden gates with their ready horns.

Three hundred years ago the Spanish was the foremost nation in Europe; now it is one of the poorest and least enterprising, to say nothing of its moral condition; the main reason for its decadence was because it cultivated savagery in its horned cattle, and in itself at the same time. Its bull-baitings were national pastimes, the moral force and energy of the nation became merged and engulfed in this savagery. So we find that it is an unmistakable fact, or rather law of our nature, that we cannot see and accustom ourselves to savagery, even in our domestic animals, without its reacting upon ourselves.

There are certainly no morphological reasons why we cannot have hornless cattle; they are as healthy as the horned in every respect, perhaps more healthy, for they surely will not have "hollow-horn." That horns still exist is because the force of habit has been too strong for this change for the better.

I once met a Texan upon the plains, who insisted that if we had horned horses, (just think how they would look!) they would be far preferable to our present kind; but he had never used anything but mustang ponies or seen anything but the Texas steers, and the savage and rough surroundings of the Western plains, and there was therefore some sense in his remark, judging from his stand-point. But from our stand-point and our present surroundings, there is no sense in any longer breeding horns upon our domestic animals, for it retards religious or moral elevation. We ought in this age of boasted progress and advancement to get upon a higher plane, and above the continuance of this relic of the barbaric ages. D. S. MARVIN.

The Apiarian.

IMPROVING HONEY PLANTS—A POINT TO SEED GROWERS.

THE family of the Leguminosæ is one of the best for bees and for cattle. In this family we find the White Clover (Trifolium repens) of our pastures, the Melilot (Melilotus alba), whose name is derived from the Greek word *meli* (honey), and the Sainfoin (Onobrychis sativa), a plant which does not withstand our Winters, but which, in France, gives the best honey and the best fodder.

Nearly related to the White Clover is the Red Clover (Trifolium arvense), which furnishes as great a quantity of honey as any one of the other plants mentioned. Every country boy has sucked the honey from the tubes of its corollas; but few know that, if they had the chance of tasting this sweet, it was because bumble bees are nearly the only insects which can reach it, and bumble bees are too few in number to absorb such a large crop, which, therefore, remains unharvested, the corollas of Red Clover being too deep to allow the honey bees to suck it.

These corollas are only a very little too deep; for, during the drought of some Summers, the flowers of the second crop, being a little shorter, the Italian bees find in them a good harvest; yet it is doubtful whether in the best circumstances their probosces are able to reach the bottoms of the tubes. Moreover, the honey of the main crop is always out of reach of the bees, and the aim of bee-keepers is to produce a kind of bees endowed with a tongue long enough to reach the bottom of the clover blossoms, or to produce a kind of red clover whose blossoms would be shorter or wider, so that bees could suck all the honey; or to attack the difficulty in both ways at the same time. The work has already begun. Some bee-keepers try to produce bees endowed with longer probosces, and some others are selecting, in the fields, the plants whose corollas are wider or shorter than usual, in order to secure a sort in which they will be broader. But the task will be long, and we want help, if not in regard to bees, at least in regard to the selection and propagation of selected plants.

A seed grower who would take the thing in hand, planting selected clover with this object in view, if he succeeded, would be sure of a good sale of seeds at remunerative prices; for every bee-keeper would try to have the new variety introduced to his neighbors. Of course, the end to be attained is, not to produce a short corolla by raising a diminutive plant, but to create a strong, vigorous kind, endowed with short or wide corollas, the sap of the plant being directed more towards the branches and the leaves than towards the corollas.

I dare to predict to the lucky man who would

succeed in raising a clover with such fixed characteristics, large sales and big profits.

Hancock Co., Ill. CHAS. DADANT.

Industrial Societies.

The Atlanta International Exposition.

THERE is a general impression all over the country that the International Cotton Exposition, which opens in this city on the 1st of October next, is to be simply a cotton exposition, confined to cotton, its culture, preparation for market, and its manufacture, the various implements and machinery connected therewith, and the various and varied fabrics into which it enters. Such was the impression of your correspondent when he called to-day on Hon. H. I. Kimball, the Director-General of the Exposition. In fact, this was the original idea of the exhibition, but it has been changed to a general fair to include all of the products of the soil as well as stock and all of the industries. But cotton is to be king—the most prominent feature. Notwithstanding the general character of the show, it still bears the name of Cotton Exposition. From the great interest manifested, not only in this country but in foreign lands also, it promises to be the most important and interesting exhibition ever held in this country, excepting, of course, the Centennial.

Through the courtesy of Dr. A. L. Kennedy, of Philadelphia, Pa., who is here assisting in arranging the preliminary details of the Exposition, I am able to furnish you in advance of publication with the dates of entries of the different departments not connected with the cotton department proper.

Fruits and Flowers	Nov. 2
Cattle, Horses and Mules	Nov. 9
Sheep and Swine	Nov. 16
Bench Show of Dogs	Nov. 23
Poultry	Nov. 30
Dairy Products	Dec. 7

For the benefit of those interested in the canning business, I would state that, notwithstanding the unfavorable Spring, the peach crop in this State is abundant, and for the next two months an ample supply for this purpose can be had at reasonable prices.

Atlanta, Ga. A. J. C.

Arboricultural.

PANICLED FLOWERING KŒLREUTERIA.

I SHOULD like to know how many of the readers of the RURAL NEW-YORKER are acquainted with the Chinese or Panicled Flowering Kœlreuteria—Kœlreuteria paniculata. I presume not many of them, for I do not recollect seeing many specimens, and the name is but seldom mentioned in the horticultural periodicals. Now I am inclined to the opinion that a tree possessing all the desirable qualities of this interesting species, viz., the short, stocky growth of its blunt shoots, its light-colored, airy foliage and the abundance of its peculiar, large, bladder like seed vessels or capsules, and, last but not least, its large, showy, loose terminal panicles of bright yellow flowers which are abundantly produced at a season when few if any trees are in blossom, render it a very desirable addition to our list of very choice ornamental trees for lawn decoration, for which purpose it should be more employed.

The Kœlreuteria belongs to the natural order Sapindaceæ and is a native of China, from which country it was introduced in 1763. It forms a round-headed tree of small or medium size from 20 to 25 feet high, with short, stout branches with a brownish-colored bark. The leaves are alternate pinnate and are composed of about 13 serrate leaflets. The highly ornamental flowers are produced in terminal panicles about the end of July, and soon after the large bladder-like seed pods, or capsules, appear.

The Kœlreuteria is unfortunately of remarkably slow growth in light, loamy soil, which appears to be the most suitable for it. Its annual growth rarely exceeds one foot, and when transplanted to a wet or exposed situation, the young shoots are occasionally injured by our severe Winters; but when grown in light soil and a partially sheltered situation it remains uninjured. In Summer the color of the leaves is light green, changing in Autumn to a fine yellow. The Kœlreuteria is propagated by seeds or cutting of the roots; but strong plants can be obtained cheap from most of our leading nurserymen.

Queens Co., L. I. CHAS. E. PARNELL.

[A full first-page engraving of a branch and flower panicle was presented in the RURAL of April 24 of last year (p. 261) with fruit and seed on page 262. The drawing was made from a specimen growing on the Rural Grounds.—EDS.]

Industrial Implements.

THE NEW BUCKEYE STEEL SPRING WHEEL HARROW AND CULTIVATOR.

THIS implement is likely to gain a wide popularity for the excellence of its materials and workmanship and its efficiency in the field. Its high wheels and broad tires insure a light draft, while its steel spring seat must make it a favorite with the operator for whom it saves the trouble of trudging alongside. The pressure on the teeth and the depth for deep or shallow cultivation, or for hard and soft soil, are regulated by the lever handily near the driver, who, whether man or boy, can easily either throw the entire weight of the harrow on the teeth if desired, or raise them out of the ground for transportation. The teeth are, we are assured, made of the best spring steel, tempered in oil, and they are thoroughly tested before they are sent out. Their shape is the best for soil cultivation, and being coiled around the pressure bar, they easily pass over stones, roots, or other obstructions. To insure durability the points are hardened and they can be readily sharpened when use renders them dull. This newly devised implement is manufactured by P P. Mast & Co., Springfield, Ohio.

Miscellaneous.

RURAL BRIEFLETS.

A SOUTHERN correspondent writes us as follows:—

"Inclosed I send you some Bermuda Grass seeds. They are not quite perfectly mature.

Clinton, La. W. F. K."

If our friend would examine these spikes under a microscope, he would find that there were no perfect seeds. The stamens and pistils can easily be seen, which shows they were plucked too early. We have Bermuda Grass in bloom, and it would be hard to tell it from the specimens sent. In a postscript our correspondent adds:—

"From an article by Mr. Todd in a late RURAL, his gad-fly must be a different insect from what we have here. When the lumps appear on the backs of the cattle we can easily find the orifice into which we drop the turpentine. This remedy was first made known to us by a colored ox-teamster and farmer, and it is a specific."....

A friend writes us:—

"So Mr. LeDuc has been obliged to resign after all, and the "ways that are dark and tricks that are vain" did not secure the place for the Broadway drawing-room editor who was "born, bred and reared a farmer," and we sha'n't know just yet how he would run the Department. If the croaking editors who have found so much fault with Commissioner LeDuc's management would indicate their policy, we might judge as to the advisability of adopting it; but I fear the politicians have decided to run the Department in their own interest for the future. It looks that way, but *nous verrons*. But, Mr. Loring, you have my best wishes."....

The Best Berry-Pickers.

I notice a statement in the Tribune of July 20th, that P. T. Quinn considers "boys" very unsatisfactory strawberry pickers. This agrees with my experience, and for several years I have refused to employ them. Women and girls are far more faithful berry-pickers, and are more easily managed. Another peculiarity I have observed is, that those who need money the most are the poorest workers, being as a rule, unsteady, shiftless and always ready for a strike. My best pickers own a house and lot; while the very best have money besides in the bank. I suppose that poverty is not the cause of laziness, but that laziness causes the poverty. NELSON RITTER.

Onondaga Co.

What Others Say.

OUR DOCTORS.—Speaking on this subject, the Journal of Chemistry says that the disadvantages under which the public rest in their relations to physicians are numerous and positive, and it is not easy to see how they can be fully removed. A coarse, vulgar charlatan is easily detected by persons of ordinary intelligence and sagacity, but even such manage to thrive in many communities not distinguished for ignorance or credulity. The low, unlearned quacks are bad enough and numerous enough in every community, but they are not always the most dangerous class that presume to prescribe.

OUR legalized schools of medicine turn out every year scores of young men who are no more competent to practice the healing art than they are to use the brush of the painter or the chisel of the sculptor. They go out into the world under the cover of a "diploma," a sort of license of a supposed respectable character, which raises them above the plane of the recognized quack, and gives them standing in the community. These men are more dangerous than the vulgar charlatans, because they escape, to a larger extent, public scrutiny and suspicion.

A PHYSICIAN of the highest order, says the Journal, is the man who is great in emergencies, who is keen in discernment, cool in judgment, sagacious in expedients, assuring in demeanor, kind in counsel. The great physician is one who relies but little upon medicines, little upon dosing, little upon specifics. He realizes that if a cure comes nature, in nine cases out of ten, must have the credit.

LIME IN AGRICULTURE.—Mr. Stewart speaks, in the N. Y. Times, of the Use of Lime as a Fertilizer. Lime is the most conspicuously active substance known to the farmer in operating upon inert matter in the soil, and is directly a most important constituent of all plants. The almost universal presence of lime in the soil is shown by the so-called hardness of the water.

LIMESTONE consists of 56 per cent. of lime and 44 per cent. of carbonic acid. The stone burned in kilns is deprived of its carbonic acid, loses nine-twentieths of its weight and becomes the hot, acrid, alkaline substance which we know as lime. Freshly burned lime will absorb and unite with one-third its weight of water without appearing the least moist, and in thus combining produces violent heat, sufficient to inflame wood, and falls to a fine powder, swelling to three times its original bulk. This powder is hydrate of lime, or caustic or quick lime.

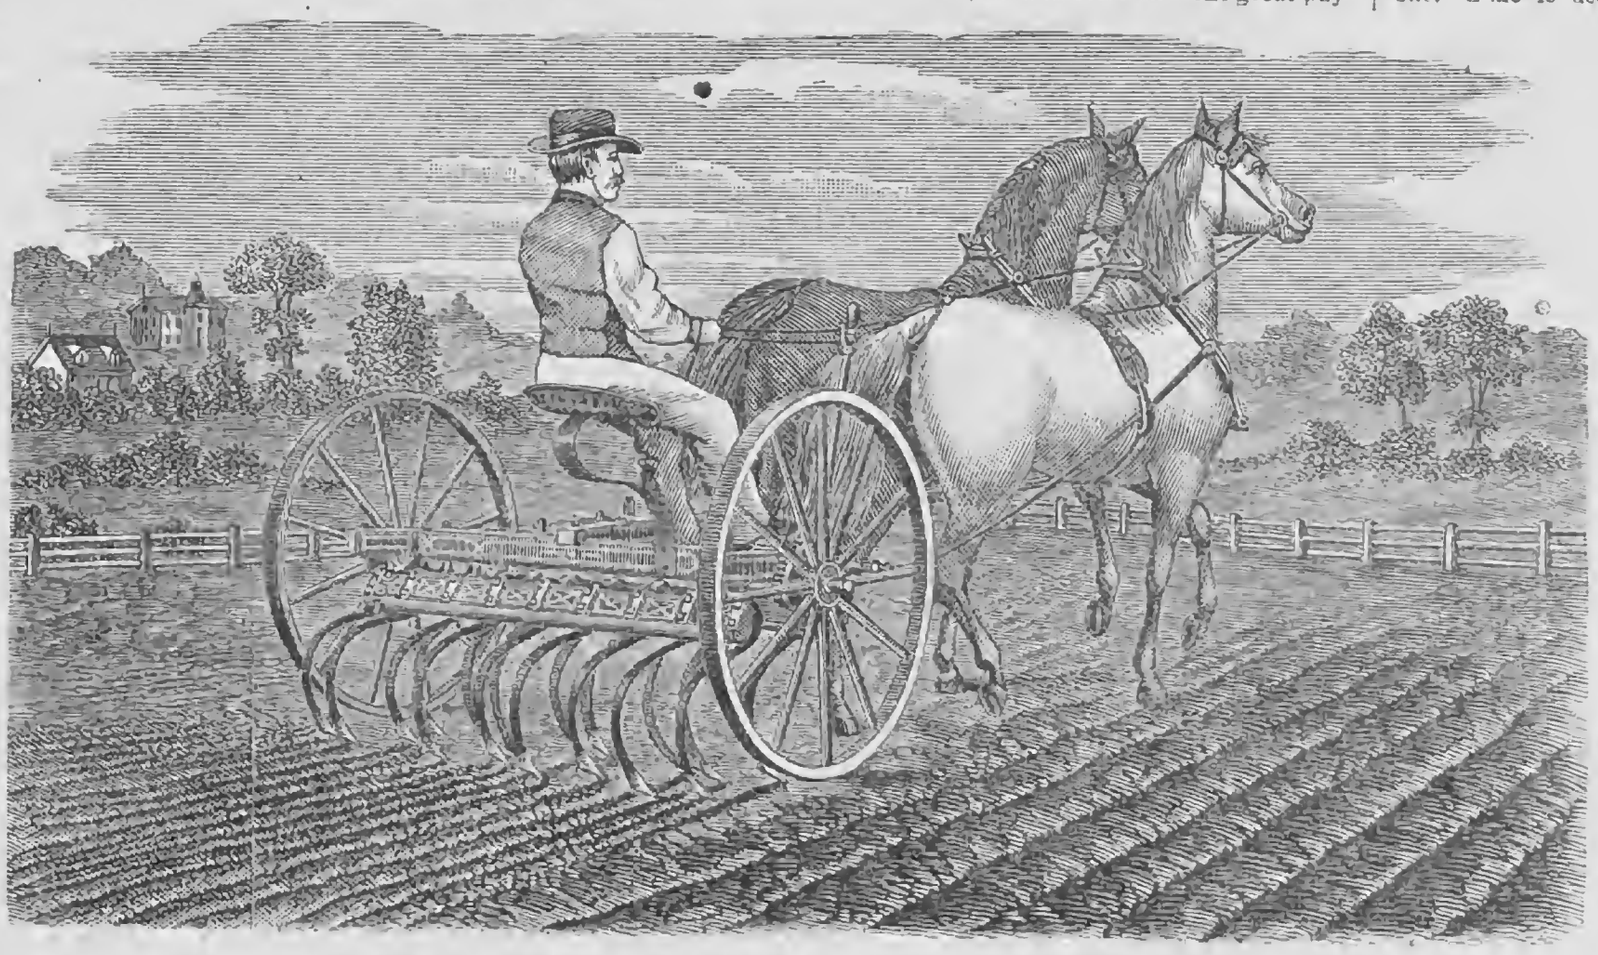
CAUSTIC lime is of the greatest value in the soil. It rapidly decomposes organic matter, separates the nitrogen from it, and causes very effective nitrification; it makes the other elements soluble and available as plant food, and supplies in itself a needed food for plants. It also has a very energetic action upon the mineral elements of the soil; it makes the limestone (the almost insoluble carbonate of lime) itself more soluble; it separates potash from clay and sand, in which it exists as a silicate, and sets this useful element free for plant food. It loosens the texture of heavy clays and binds together loose sands, and thus improves both of these soils and makes them more easily and effectively worked. Of such varied and effective value is lime to the farmer.

THE methods of using lime are two, and in each of these it is indispensable. One of these is by direct application to the soil by top-dressing and the other is in composts. When lime is to be spread upon the soil it is first slaked. This is effected by causing it to absorb water to the extent above mentioned, when it becomes a fine powder or dust. It is then easily spread over the soil by means of a shovel. The quantity used varies from 10 or 15 to 40 or 50 bushels per acre. The method of application is as follows: When the land has been plowed and harrowed the first time, the manure is spread and covered with a light furrow; the lime previously air-slacked is spread upon the field as evenly as possible from a wagon, and with a long-handled shovel.

LIME is of the greatest value in composts. Pure swamp muck contains from two to four per cent. of nitrogen, which, if it were available, would make it worth from $10 to $20 a ton, equivalent to a value of many thousand dollars for an acre of muck two or three feet deep. If this inchoate but inherent value of muck can be made available, it can be best done by the aid of lime in the compost heap, and a ton or 40 cubic feet of the muck, composted with four or five bushels of fine air-slacked lime, with a little stable manure as leaven to start the fermentation, might possibly be made worth the sum stated.

This subject is a pertinent and timely one. Lime is used in some localities with the greatest benefit in others its use is unknown. It has been said of localities in which handsome and fertile farms fine orchards, houses indicative of comfort and contentment, barns bursting with plenty, fine horses, handsome and sleek cows, and other signs of thrift abound, that "these farmers lime their land." And the remark is generally justified. It has also been said, *per contra*, that "lime enriches the fathers but ruins the sons." But this is properly to be interpreted as casting whatever blame there may be on the fathers, and not upon the lime, for it is a part of good farming to use the proceeds of the land, in part, in maintaining its fertility, and if any agent, as lime, is capable of enriching one generation, those who squander so generous a gift are alone to blame, and not the agent. Lime has its valuable uses; it is the good farmer's business to use it with understanding and good judgment, so as to permanently improve the condition of the land and not as a means of exhausting it as rapidly as possible.

BLACK WALNUT LEAVES AS A REMEDY FOR DIPHTHERIA.—Dr. C. R. S. Curtis, of Quincy, Ill., reports, in the Boston Medical and Surgical Journal, results of the local use of a decoction of leaves of Juglans nigra in diphtheria. The remedy was chiefly employed as a gargle, or applied with a swab to the throat and fauces. A poultice of the leaves was also resorted to in some instances. Dr. Curt



THE NEW BUCKEYE STEEL SPRING WHEEL HARROW AND CULTIVATOR.—FIG. 417.

adopted the practice in consequence of the recommendation of Prof. Nelston (in his "Elements de Pathologie Chirurgicale") of the Juglans nigra as a remedy in malignant pustule. The use of the gargle was unattended by discomfort, no patient objecting to it; and improvement in each instance was rapid, the œdema subsiding, the ash-colored spots disappearing.

BASSWOOD TREES FOR HONEY.—For a number of years we have been advising farmers who keep bees to plant basswood trees in every available place for the purpose of furnishing pasturage for the little honey gatherers. Honey gathered from the flowers of any of the numerous species of basswood or lindens—as they are known by both of these common names—is equal to that obtained from the White Clover, says the N. Y. Sun, and there is no good reason why the farmer should not provide pasturage for his bees as well as for his cattle. The European basswoods come into bloom at an earlier age than our American species, and produce flowers in greater abundance, and for this reason are preferable for supplying the bees with honey; but all species are excellent for this purpose.

THE Rural Home says that the multiplication of machinery in farm operations renders it quite important that young farmers should study mechanics, and if afterwards they should spend a few months in learning the machinists' trade they would be better qualified for their business.

THE SPIRIT OF GAMBLING, Gov. Seymour says, is the greatest evil our farmers have to contend with. Take hops, for instance. That is an extreme case. More men have been ruined by holding their hops for higher prices, when they could have sold at 30 cents a pound, than have been hurt by selling in season when the market ruled at 10 cents a pound. So with wheat. Farmers are always holding out for higher prices. This peculiarity seems to be confined to the native or American farmers, and that is the reason why they are put at a disadvantage when they have to compete with German and other foreign-born farmers, who sell whenever they can realize a fair profit. Not until the American farmer rids himself of the gambling mania can he compete on terms of equality with his neighbors abroad.

WE find the following in London Truth:—"One of the strangest farms in the world is the gigantic terrapin farm of Mr. Dorton, in Alabama, which is stocked at present with 20,000 head of turtle, that are reared and fattened for the New York market. They eat nothing in Winter, and they can be fattened on crabs in Summer, at a cost of a dollar a dozen. Mr. Dorton sells them at a dollar each in New York. Yet we have to pay a guinea a quart for turtle soup!"

WHEAT FOR LAYING HENS.—The Mark Lane Express (London) says that an American writer says that as chemical analysis proves wheat to contain more albumen than any other grain, it should be the foundation of egg production. If the white of a hen's egg contains 12 per cent. of albumen, it is certain she cannot produce so many eggs from food which is deficient in albumen. On the other hand, it is not so useful as maize for flesh and fat-forming—thus, while one food is useful for laying fowls the other would appear to be more valuable for fatting for market. There is, however, something else to be considered, viz., cost. Wheat may be better than maize, but the question is—Is it better at the price? If wheat is 50 per cent. dearer than maize, weight for weight, does it contain 50 per cent. more in feeding value? If not, it is not so cheap.

THE English say that the relation of friendship between England and the United States was never so strong as it is now, and that all things are now even. Yet England accuses us of sending dynamite, infernal machines, potato bugs and trichinæ, all of which are not half as bad as the English [sparrows.—N. Y. Herald. . . . . The Detroit Free Press wonders why it is that when a pedestrian is drenched by a basin of water from a fourth-story window he always wants to whip somebody who lives on the first floor. . . . . "If ever I deliver another agricultural lecture it will be on 'The Farmer as a Gambler,'" says Gov. Seymour. If all gambling in farm products could be stopped, it would be a consummation most devoutly to be wished for. . . . . A Michigan farmer tells the N. Y. World that to kill Quack Grass he plows the land early in the season and cultivates often, so that no grass can grow. He does not cultivate the land deep at first, but cultivates shallow and often. "This," the editor of the World remarks, "is not in accordance with the general opinion. Most farmers advise deep plowing in addition to repeated cultivation as the only true remedy." It is just in so doing that they make a mistake. We rid a field of Quack at the Rural Farm by giving it the cultivation which the crop should always have—but the cultivation is shallow. . . . . Beecher says that Hades is a state rather than a place. Jersey, we'll bet.—Turner's Falls Reporter. . . . . A man need not flatter himself on everything about his house being as regular as clock-work, simply because he buys everything on tick. Unlike a clock, he will run down when his affairs are wound up.—Boston Transcript. . . . . Longfellow says:—

"Joy, temperance and repose,
Slam the door on the doctor's nose."

. . . . . We heard of a conscientious cow, once, that always made a point of filling the pail, turning her head to see. A wicked man one day milked her in a pail that had a hole in the bottom; the pail did not fill; the cow saw this and fled; she was hopelessly insane ever after. This is the sort of cow we should like, without the insanity.—English Live Stock Journal, *via* N. Y. Tribune. . . . . Mr. Hovey pronounces "the golden Pocklington" as large and handsome as a Golden Hamburgh, as rich and transparent as a Thomery Chasselas, and quite as sweet; and this, with the black Concord, the red Brighton, and the amber Rebecca as the four finest grapes sufficiently hardy to stand 20° below zero. The Pocklington, comments Mr. J. J. Thomas, is a fine grape when ripened into October, but he could never place it quite so high as the above estimate, and he would add to the list of fine American sorts such grapes as the Delaware, Duchess, Niagara, Prentiss, Jefferson and a few others. . . . . The Husbandman says pork slightly tainted may be saved from further harm by putting pieces of wood charcoal into the brine. Use freely according to the degree of taint, and offensive odors will be absorbed and decomposition arrested. . . . . We find the following good item from Harris's Talks on Manures in the Elmira Husbandman: One ton of good bone dust contains about as much nitrogen as 8½ tons of fresh stable manure, and as much phosphoric acid as 110 tons of fresh stable manure. But one ton of manure contains more potash than five tons of bone dust.

Everywhere.

NOTES FROM SOUTHWESTERN VIRGINIA.

To the people of the North it is not easy to believe one can feel as much at home in the South as he really can, and little can they realize the great pleasure that is born of so mild and pleasant a climate. To tell them that here, save along the creek or river bottoms, there is far less annoyance from insect pests, such as mosquitos, gnats, etc., than is usual at the North, is often considered a mere allurement to settlers; but all through this intensely hot Summer we have lived with windows and doors open both day and night, and only the common house fly has troubled us, although we have had no protection, such as netting, etc. In this respect we never passed a more pleasant six months than the past here.

It is only energy that is needed. Land is cheap, good, and easily worked—really the *best* I ever tilled, and I have seen most of the land from Boston to St. Louis and from St. Paul to Galveston. Storms are many degrees less in severity than in the Northern States. This region is not subject to the cyclones of the West. It is a comparatively new country; yet it has been inhabited for 250 years, more or less.

Since the close of the war in 1865, all is changed. The former condition of the people was based on the labor of the colored man; their present condition rests on the labor of each individual. The country has to be repeopled and as these will come from the "land of vim" there will be an entire change. The choice farms (lands that can and will be made such) will change from the present dilapidated condition to that of the orderly and productive possessions of the Yankee land, and the $10-land now begging for an owner, when properly cultivated will have as high a reputation as the Genesee Valley of N. Y., or the famed Lancaster Co., of Pennsylvania. I have seen them all, and know of their worth and character, and believe these lands, especially here in Chesterfield Co., will, a decade hence, be appreciated, and sought for, and eventually take a *front* rank even above those named. It requires light tools, fine-toothed cultivators, rakes, plenty of fertilizers, and continued attention to produce the highest results; but the returns will well repay all the needed outlay. [Strange, isn't it? that, as a rule, it is the richest land, in the most delightful region, and among the most charming people, that is for sale! Eds.] The old way of "plowing the corn," "hacking weeds" with a three or four-pound hoe and the various other antediluvian methods will soon be memories only. Health, one of the most, if not *the* most important point to be considered in selecting a new home, is found here in perfection. The best of water is not far from the surface, while much of the land abounds in excellent springs.

It is necessary to have a small fund to live on during the first year. Don't hurry to buy. Come and look. Take no one's word. Choose for yourself; buy of the owner if possible. Better stay a season and look around than buy too carelessly. There will always be found more or less fever and ague along rivers; but none on the rolling portions. I will add I have no land for sale nor am I interested in any. I am only a home-seeker, but I like the country better than any other I have seen and intend to stay the rest of my life in the South. The cold North has no charms for me, though it is my birth-place and where I have spent nearly 50 years. The South is the "coming" land for home-seekers. Life and property are as safe here as in any portion of the North or West. Churches, schools, stores and all that a Northern settler should want are here, though often in a different shape from what he might have expected. We hear the news from all points of the globe as readily as in New York or Ohio. It is a "Sunny South;" yet the heat is no more intolerable than at higher latitudes. Two crops can be grown per year: so if the first one is a failure there is plenty of chance for another. The advantages of this region can only be appreciated when one has had personal knowledge of it. [While willing to permit our correspondent to give his early impressions of the country, we would attach more importance to what he says of it, if he spoke from a personal experience of a few years.—Eds.] It must be remembered that this portion of Virginia has been settled and worked, and that the soil has been more or less drained of its fertility by the wasteful and careless culture of the disinterested laborer for over 200 years. Where else can a soil be found, that, under such treatment, would be capable of producing even pines? but here a quick and strong growth of both pines and hard wood immediately succeeds the close of culture. This is the home of the grape. Wild ones produce very large berries and grow everywhere. Strawberries and blackberries (cultivated) are always a sure and plentiful crop, while whortleberries of some three or more sorts grow at every turn. I care not where one may go there will not be found anywhere more good points in one location than can be here met with.

Chesterfield Co., Va. A. Q. M.

RURAL SPECIAL REPORTS.

Arkansas.

GRAND PRAIRIE, Near Carlisle, Prairie Co. Aug. 5.—When so good and widely read a paper as the RURAL NEW-YORKER publishes such an article as that from "Arkansas" in the issue of July 30, it requires special notice. Mr. H. B.'s three years' residence has not fully qualified him to be a reporter of the State. The fact is there is not on the face of the globe a section at this latitude which produces more corn and oats per acre than this, if any attention is given to cultivation such as the soil and climate demand. Every variety of grape, sweet potatoes, peanuts, melons, early peas and strawberries are No. 1. Tobacco does finely, as do broom corn, sorghum, beans, etc., etc. The White Mulberry grows luxuriantly, and undoubtedly the raising of silk-worms would be a first-class success. While it is generally considered good, successful farming to produce from half a bale to a bale of cotton to the acre, Arkansas has rich bottom lands that always produce a bale to the acre, along the rivers which are numerous, four large navigable ones crossing the State. It has a great number of beautiful prairies which produce large quantities of good hay that is cut, baled and shipped, being considered nearly as good as Timothy. A kind of grass called Crab Grass in this locality grows up after oats and makes excellent feed and hay worth $8 per ton. I milk a cow (a Short-horn brought from Michigan) and she gives more milk at a milking than she did North. The fact is people that come from the North, as I did, are apt to demand things that are quite unreasonable in this climate; for instance, an average of from 20 to 30 or 40 bushels of corn per acre so far South of the grass and corn belt of the Northern States; and yet in this vicinity there are many places that will yield nearly that quantity. The soil is a fine compound of fine silicate, alumine and sedimentary vegetable deposit. This country is about one-half occupied by people from the North—Iowa, Illinois, Indiana, etc. The other half are native-born or from the States further east, and they are, many of them, colored. West of the center of the State there are fine mountain ranges, valleys and clear streams; here we get water that is good at from 30 to 40 feet. J. A. J.

Canada.

PERTH COURT, Ont., Aug. 6.—Crops as a rule in Canada are much better than was expected. The severe Winter killed out much of the Fall wheat, but what is left is of excellent quality and a good yield. Spring wheat has been to a great extent given up, but yields exceedingly well this year where grown. Barley and oats are heavy; and a very fine sample. Peas, owing to the bug, have been mostly given up. Roots have improved since the late rains and will average nicely. Fruit of most kinds is a failure. The potato bug was never so plentiful or so destructive. C. M. Y.

Connecticut.

NAUGATUCK, New Haven Co., Aug. 6.—Grass was a full average and very fine. Corn promises a full crop. Rye was extra-good; so were oats. Potatoes promised well till the present week; the rot has appeared on many vines. Apples are scarce. Blackberries were mostly winter-killed; other small fruits are plentiful. Pears are a large crop—equal to that of 1879. Quinces were destroyed; something eats them and eats off small twigs also; yellow fungus begins on the stem and destroys the quince. H. N. W.

Kansas.

EDGERTON, Johnson Co., Aug. 5.—I have thrashed my wheat and it only made eight bushels per acre—I expected 15 bushels. The wheat crops of my neighbors have turned out about the same; and so will all those in this section—on thrashing, wheat will yield about half as much as was estimated in forecasting the harvest. W. F. JR.

Kentucky.

WILSONVILLE, Spencer Co., Aug. 3.—Our wheat is very light; oats very good; rye ditto—very little sown. Potatoes excellent. My Beauty of Hebron is large and fine and will yield more than the Early Rose. My Argenteuil Asparagus came up nicely and did well, but R. B. S. did not follow its excellent example. My oats did, however, and the flowers, pinks, etc., have just begun to bloom—they are beautiful. We appreciate our RURAL seed very highly. J. P.

Missouri.

PLEASANT MOUNT, Miller Co., Aug. 1.—We have had a spell of very hot, dry weather curling up the leaves of corn and damaging late corn and all kinds of garden vegetables to a considerable extent. Wheat thrashing has fairly commenced and so far the yield is very poor, being from three to eight bushels to the acre while the quality is equally poor. Oats yield better, but the grain is light, weighing about 25 pounds to the measured bushel. Corn that was planted early and well cultivated is very good, while late corn will amount to nothing unless we have a good rain in a short time. A few farmers who lost their wheat by chinch bugs plowed up the ground and sowed buckwheat which seems to be doing very well. Potatoes are not doing well—too many bugs and too little rain. In short, there seems to be a general failure of all kinds, no crop of any kind making a full average, unless we except grass. The chinch bug has damaged wheat, corn and oats to a large extent. I hear of a few cases of cholera among hogs. N. J. S.

Montana.

STEVENSVILLE, Missoula Co., Aug. 3.—The Telephone Peas and the Washington Oats appear to be grand acquisitions. I would not take five dollars for the oats I will raise from this year's sowing. R. P.

Nebraska.

ALBION, Boone Co., Aug. 4.—Harvesting is in progress. A very poor crop of wheat. Oats pretty good. Corn magnificent so far. Potatoes, a fair yield. W. F.

New Jersey.

COLUMBUS, Burlington Co., Aug. 4.—I have dug my Elephant Potatoes and got 21 pounds. My Washington Oats yielded three pounds. My Argenteuil Asparagus came up finely and now stands eight inches high. It has been too dry for the R. B. Sorghum; what is standing looks pretty well. I had 20 grains of "Golden Grains" wheat sent to me last Spring, and out of the 20, 18 sprouted. They were sowed on March 2, but owing to the drought the ears did not fill very well. I think it would do best as a Winter wheat. I have one-fifth of an acre of Marvin Strawberries from which I picked 514 quarts. They were the finest berries grown around here; some of them measured six inches in circumference. I have set out about an acre for next year; they are looking fine. I have tried them on three different kinds of soil and find they do best on that which is light with clay bottom. C. C.

North Carolina.

HENDERSON, Vance Co., Aug. 2.—Hot, hot and dry. Corn can hardly recover. Cotton suffering. Grapes ripening rapidly; Ives will all go forward this week; Concords close on their heels. P.

The Querist.

ANSWERS TO CORRESPONDENTS.

The Healthfulness of Manure Cellars.

S. L. Sharon Center, N. Y., says: "Intending to remodel my stables with a view not only to make but to save manure as well as to avoid

the labor of carrying it out by hand, I propose to keep my cows over the basement or cellar so that the liquid and solid droppings can find their way below together, which, I think, will be the easiest way to keep the stables clean; but here I am met with the objection that the manure cellar will make the stable overhead unhealthy for cattle, and my object in writing to the RURAL is to learn whether this is the truth from those who have had experience in this mode of stabling cattle.

ANS.—There is no possible objection to the use of a manure cellar on the score of healthfulness, if proper arrangements are made; and there are many advantages arising from it. A description of the writer's manure cellar may serve to answer fully all the points of the above inquiry. It is under the cow stable and is eight feet deep, placed on sloping ground, so that the cows enter the stable from a level surface and a manure wagon can be backed into the cellar to take out manure at the other end and at the side through wide doors. The cellar wall is of brick and stone, and the floor is not cemented, and is kept covered with swamp muck and other absorbents to take up the liquid. The floor above is double plank, with joints broken. The manure falls into a gutter behind the cows and the gutter has two trap-doors through which the manure is drawn with a broad hoe into the cellar. All the liquids are saved. The cows have a dry, clean bed always. No smells come up from the cellar, as it is thoroughly ventilated by the two doors and two open windows. Plaster is always scattered over the floor and gutter when the manure is cleaned out, and this absorbs all the bad odors. There is less odor about a stable so kept than in one where the yard adjoins it, and the cows have to tramp back and forth through the manure piles. With a manure cellar the yard may be kept clean and well littered, and be made as free from smells as the stable.

Salt for Stiffening Straw.

W. W. P., Karnett, Kansas, having some ground on which the wheat lodges every year, asks whether applying salt to the soil would be likely to stiffen the straw.

ANS.—The general experience is that the application of salt to wheat stiffens the straw, brightens the berry and increases the yield. It has been found, however, that it has little or no effect near the sea-coast, probably because enough of it is carried on the air to the soil in such places. Spring is the best time to apply it, and five bushels per acre are usually sown. Even in inland regions its effects vary greatly according to the needs of the soil. For ourselves, we have found little or no benefit from salt on the Rural Farm, although the air is often so laden with it that it can be tasted on the lips. It has been supposed that salt prevents rust on oats, wheat, etc., yet it certainly has not had this effect on the Rural Farm. Our friend's land may be too rich, or lacking in silicates—a rare thing—or it may need some special fertilizer. It might be well to apply salt, at the rate of five or six bushels per acre, on one part, and on another bone flour, at the rate of 600 or 800 pounds to the acre. Perhaps some of our friends who have had trouble under like conditions may give us the result of their experience.

Using Hen M

A. B. K. Mt. Holly, one of the six in the country—having collected from his neighbors about 200 bushels of hen manure, and wishing to drill it in with wheat, asks how much it should be adulterated so that the seed may germinate, and also with what should it be adulterated. He has plenty of good marl, and would like to know whether it would be an advantage to mix the dung with land-plaster or salt.

ANS.—We would prefer to mix the hen manure with dry earth or coal ashes—about four parts to one of the manure. Dry muck, however, where obtainable, is the best thing with which to mix it. Let the mixture lie in a heap until it heats; then work it over and mix more, repeating the operation until the dung is mixed with fully four times its weight of muck, which will probably be eight times its bulk. When hen manure is drilled with any seed, there is much danger that it will "burn" the seed, unless it is greatly diluted. It is always safer to have a thin layer of soil between the manure and the seed. Land-plaster, salt, etc., had better be spread separately,

Raisin Grapes.

A. C. Somerset, Md., asks whether the raisin grapes of California will succeed on the Atlantic seaboard.

ANS.—The raisin grapes all belong to Vitis vinifera, or the foreign class, and all the varieties become hot-house grapes upon our slope of the continent. They are of little value for general out-door culture here; they differ from our native grapes in being larger, more meaty, and of firmer pulp, which adheres more to the skin, and less to the seeds than in our grapes. There is no good raisin grape among our native classes or their varieties. Some of our specialists are working in this direction, but the meaty characteristics required for a satisfactory raisin grape not being found in any of our sorts, it will require many years of special development to produce such a variety.

Egg Plants, etc.

J. P. H, Mt. Repose, Ohio, asks how to cultivate the Egg Plant; he has tried it for two seasons without success. As soon as the plants are growing nicely, small black flies infest the leaves, causing them to dry up soon. He has fought them in vain with ashes, plaster, soot, etc., and even with diluted carbolic acid; 2, how to get rid of pennyroyal in wood pastures.

ANS.—1. The seed should be not more than one year old. Sow in drills three inches apart, in hot-beds, from the 15th to 20th of March, and when the plants are two inches high transplant them into another bed, setting them two inches apart each way. Protect the sashes at night with straw mats till the weather is warm. Avoid opening the sashes until an hour or so after removing the mats, so that the plants will not "damp off." Transplant to the open ground about May 30. Soil should be deep, rich and well tilled. Set the plants three feet apart each way and sprinkle bone-dust or superphosphate around the roots. Keep the ground free from weeds. The New York Purple is the best and most productive kind. The aphides, or lice, may be destroyed by the use of the atomizer, which is now sold by many seedsman. Use tobacco water the color of tea. 2. We presume you mean the American Pennyroyal (Hedeoma pulegioides). The root is annual, so that if the seeds are collected for a single season there can be no more trouble.

Miscellaneous.

E. M., Darlington, Pa, asks, 1, for a plan of an "evener" for three horses hitched abreast on a wagon tongue so that the draft may be equal for each horse; 2, treatment for a two-year-old colt which has lately been afflicted with farcy, which has dried up now, leaving the animal stiff in the hind-quarters, affected apparently in the liver, with scant urine of a light yellow color; 3, will the R. B. Sorghum be more likely to ripen its seed if the suckers are removed; 4, should clover seed be sown with wheat and Timothy.

ANS.—1, Just such eveners were described and illustrated in the RURALS of March 26, page 209; April 2, page 225, and June 4, page 367, and we refer our friend to either one of them. 2, Give the horse 12 ounces of Epsom salts; repeat after three days. Then give one ounce of hyposulphate of soda daily for a month. The blood is diseased and an early cure cannot be expected. Give bran and linseed washes occasionally and no corn. Avoid musty or smutty fodder or grain very carefully. 3, Probably not. 4, We prefer to sow the clover in early Spring and harrow it in.

C. W., Corning, N. Y., has a cow which about six weeks ago began to have a thin watery discharge from the nostrils. Later the discharge become thicker and darker, and then bright yellow tinged with blood. The poor beast delights in rubbing her nose against anything, and a stake which she can run up her nostrils for from one to six inches is a godsend which she greets with a snort of satisfaction. She is falling of her milk and the "male old grannies" there say, "hollow horn" is what's the matter with her, and our friend asks what really ails her and how to cure the ail.

ANS.—The description of symptoms does not allow of a diagnosis. We should think it was "nasal catarrh" and would advise fumigation, with tonics twice a day; also a liberal supply of salt and generous feed. We would like a fuller description of the symptoms of this case before venturing any further advice.

W. F., Albion, Neb., says squash and pumpkins are thereabouts suffering from a white grub about an inch long, with a black head, that enters the vines near the ground, and he asks its name and a remedy for it.

ANS.—It is the larva of the Squash-vine Ægeria, first described by Harris in 1828, under the name of *Ægeria cucurbitæ*. This grub or borer perforates the stem of the pumpkin and squash plants near the ground and devours the interior. It becomes a winged insect the second year. A teaspoonful of saltpeter dissolved in a gallon of water, and a pint poured on each hill, is said to "do the business."

M. A. H., Westfield, Mass., asks how can clippings from Arbor-vitæ be made to root, and how far apart should the plants be set.

ANS.—Cuttings of the Arbor-vitæ root readily. Cut them into six-inch lengths and plant them firmly in mellow soil in a cool, half-shady place. Or the cuttings may be placed in sand-boxes, kept moist and cool. Three or four inches apart according to the size of the cuttings. Other questions will be answered next week.

J. A. R., Wardena, Ia., sends for name specimen of a grass that has lately appeared in that neighborhood.

ANS.—This is common Crab or Finger Grass—Panicum sanguinale. It is an annual, producing such quantities of seed that it sows itself—a very valuable grass for pasture. Horses prefer it to almost any other. It is valuable also as giving a green nip after clover fields are cut and the stubble parched, as is often the case from drought.

R. T., Ulster, Pa., sends specimens of a grub for name.

ANS.—It is the larva of the common May beetle. The eggs hatch in about four weeks after being deposited, and the grubs grow slowly until the Spring of the third year, when they are transformed to the beetle state. They infest grass the worst and such crops as the potato and strawberry. These should be planted on land that has not been to grass for at least two years. No effectual remedy is known.

R. P., Stevensville, Montana, says he was surprised to read, in the RURAL of July 16, "Sow buckwheat generally three bushels to the acre," and he asks whether that isn't too much. He sowed five bushels on ten acres and the stand was too thick.

ANS.—The oversight was corrected on the editorial page of the next issue—July 23—having been detected too late for correction in the issue of the 16th. Pecks were intended.

R. A. Pine River, Wis., asks what kind of wheat would be the best for his neighborhood—Lost Nation, Russian or Fife.

ANS.—Fife is a hard wheat and rates No. 1 in the markets, bringing the highest price. Lost Nation and the Russian wheats are soft and have a bad reputation among millers; although they are growing in favor with farmers because they are generally more productive than the harder varieties.

A. O., Westover, Md., asks what is the difference between agricultural lime and stone lime.

ANS.—There is no difference, except that the so-called "agricultural lime" in Maryland has been air-slaked by exposure to the weather. As in slaking, lime is greatly increased in bulk, a bushel of fresh stone lime is worth twice as much as one of the common powdery "agricultural lime."

F. T. J., Mt. Oscar, Canada, asks, 1, for the name of a book on cider and apple vinegar making; and, 2, one on bee-keeping.

ANS.—1. The Cider Maker's Manual, by J. S. Buell, published by Haas & Kelley, 198 Main St., Buffalo, N. Y. Probably $1. 2. Cook's Manual of the Apiary, $1 25, published by T. G Newman & Son, Chicago, Ill., is the best work on bee-keeping.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, AUG. 13.

E. A. P.—E. M.—W. H. A.—G. S. J.—D. S. M.—H. S.—C. C., thanks for "Golden Grains."—L. B. A. (Fair No.)—G. W. F.—E. W., reserved to accompany illustration.—C. C.—G. S., we are always thankful for drawings of labor-saving implements.—J. B. V. Wheeler, we are always happy to answer any questions without compensation of any kind—unless, as it sometimes happens, we receive a greater number than we can attend to or find space for.—W. J. V.—W. Implements and Machinery.

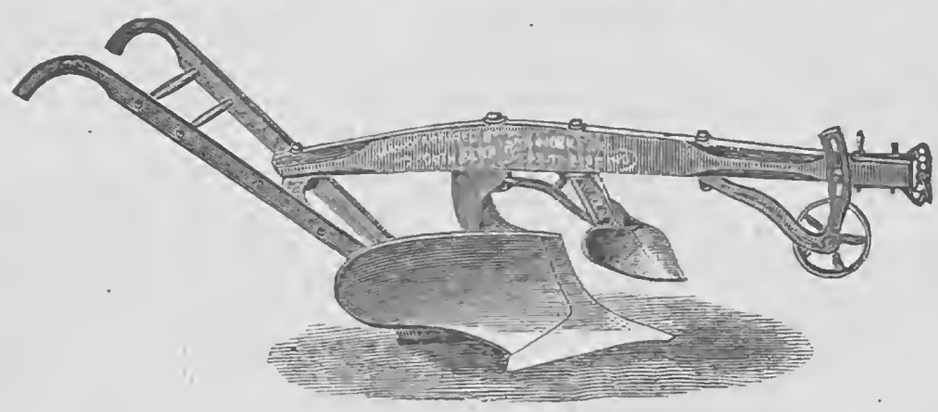
THE PLOW OF THE PERIOD.

THE "OLIVER CHILLED."

1,500 Sold in 1870



86,000 Sold in 1880.

Ten years ago almost unknown—to-day doing service on over

HALF A MILLION FARMS.

Sales steadily increasing, and showing the largest ratio of gain where it is best known.

Endorsed by the best agricultural authorities in the country—and its superior merits confessed by a brood of puny imitations.

With 700 men, nearly a million dollars of capital, and acres of buildings and machinery, employed in its production—the demand for this—

THE LEADING PLOW OF THE AGE,

has been during the past year beyond our capacity—a state of facts never before witnessed in the

ANNALS OF THE PLOW TRADE.

☞ Beware of imitations, and see that the name "Oliver" is on the beam.

THE

"CASADY" SULKY PLOW.

A revolution in the art of plow-making. Has no Landside! Carries every pound of side and bottom pressure on its wheels! Guages the width of its own furrow! Turns square corners without lifting out! Rides over buried stones without disturbing the truck! Works in the hardest, dryest ground! and accomplishes other results not possible to any other plow on wheels.

Address for Circulars, Terms, etc.

PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, AUG. 20, 1881

WE HAVE received a hundred or more samples of wheat sent in competition for our wheat premiums, which cannot be placed with the letters of those sending them. It seems that our requests that names and addresses should be written on the parcels, have been overlooked or forgotten. We regret that so many have thus been deprived of their chances in the little contest.

FRIENDS are now invited to send for the Fair Number, which will be dated September 3. The Wheat Number will immediately follow the Fair Number, and the prizes for the best heads of wheat will be announced in it as originally intended. We have received many beautiful specimens, which we wish our readers might have the opportunity of examining.

WE ARE NOW, from further observation, fully convinced that the tomato rot is caused by the tomato worm. This green, reptile-looking pest often turns from the leaves to the young tomatoes, eating a part of the flesh and then returning to the leaves. The injured portion of the tomato soon turns black and rot commences. Every instance of rot among our tomatoes, the present season at any rate, has been thus caused.

THE SOJA BEAN is being tested at the Rural Farm. It is growing in very poor soil and grows thriftily. It is now about two feet high, with many hairy leaves and upright stems. We have given it to our cattle and horses and they eat it with a relish. This plant has been praised by Prof. Cook as highly nutritious, and as promising to excel the Cow Pea, both for fodder and as a renovator for worn-out lands. We shall tell the whole story later as it reveals itself at our farm.

WE ARE glad to receive many favorable reports as to the Russian White Oats which were extensively advertised and sold during the past season. Their early growth, it will be remembered, at the Rural Farm, was not such as to inspire us with much hope as to a heavy yield. In this we have been happily disappointed. They ripen later than most kinds which bear spreading panicles—as late, indeed, as Mold's Ennobled Oats sent out several years ago in the RURAL'S Distributions. We shall give a more definite report when we come to consider our oat experiments.

FARMERS are frequently induced to sign promissory notes in payment of wire fences, lightning rods, patent rights, etc., on fraudulent representations, and there seems to be some difference of opinion among the judges in different States as to whether these notes can be collected. The other day we recorded an adverse opinion of a Wisconsin court, and now we learn that on July 19 a decision contrary to this precedent was rendered by Judge Adams, of the Supreme Court of Iowa, in the case of Scofield *vs.* Ford. The maker of the note admitted he had made it, but said it was procured from him by fraud. The Judge said the maker could not successfully defend the action on this account, as the plaintiff had purchased the note for value and in good faith before its maturity, relying on the promise therein set forth, as he had a right to do.

THE YORKTOWN NAVAL RECEPTION.

THE Secretary of the Navy has issued orders to the North Atlantic squadron to prepare for the reception of French visitors at the Yorktown celebration of October next. There is only one drawback to our making a grand naval display on that occasion, and that is, we haven't got any navy—or hardly any. We have an "elegant sufficiency" of naval officers, but if they ever wish to exhibit their proficiency in naval tactics, they will have to charter a few ferry boats and an old scow or two, to do it. And then what if we should have an occasion to go to war with foreigners? We pause for a reply! After all, a naval reception can just as well be held on land. The Frenchmen are kindly disposed and can haul their triremes up on the shore when they arrive and then repair to a hall somewhere when our Admirals, Commodores, *et cetera*, will be delighted to welcome them. All we wish is to create a good impression on our French naval cousins, and this we can best do at a distance from our "noble fleet," where their attention will not be distracted from the glittering tinsel and golden epaulets of our officers by our iron-clad monitors. (!) Then when the Frenchmen get ready to go home our officers can delegate some "middies" to kindly assist them in launching and they will go home with exalted ideas of the great American navy and its immense "reserved power."

GO TO THE FAIR.

There are a few farmers in almost every community who never attend their county or local fair, and of course take no interest in them. In pursuing this policy they are losers, though it would doubtless be difficult to make them think so. There is much for every intelligent farmer to learn at these fairs, and if he would keep abreast of the times it is his plain duty, rather highest privilege, to seize every opportunity which shall give him a more extended knowledge and a greater familiarity with everything that pertains to agriculture and horticulture.

At such times he can "compare notes" with his brother farmers and in relating his own experience with certain fruits, grain, etc., and in noting the experience of others with the same, he may impart, as well as gain, some useful hints which shall be of use in the future. There is no better place for such discussion and such "experience meetings" than at the fair. It also gives him an opportunity to examine the latest improved machinery and to get, on the spot, the unprejudiced opinions of his farmer friends, to guide him in purchasing for himself. There is machinery on exhibition every year, especially at our State Fairs, which some farmers would never see at all if they absented themselves from these exhibitions.

Not only should every one go to the fair but he should contribute, from his farm and garden products, in making the fair a success. Almost every one has something "unusual," some novelty which will add to the attractions, therefore we say to every farmer "Go to the fair, and do all in your power to support and to elevate it."

A PUBLIC BENEFACTOR.

WHAT Jenner did for the human race, Pasteur has done for the lower animals as Sir James Paget, one of the most renowned of England's great physicians, said in thanking the eminent scientist last Monday, in the name of the International Medical Congress now assembled in London. Pasteur's address on his latest researches in animal vaccination, delivered before the Congress, is, according to cablegrams, creating deep interest in medical as well as in agricultural circles because of the prospect it affords of reducing cattle diseases to a minimum. France, said the Professor, every year loses animals to the value of 20,000,000 francs by splenic fever, better known in this country by one or other of the names of the numerous forms of anthrax. As mentioned by us a couple of months ago, he has lately, after a world of experimenting, discovered a form of vaccine which protects the vaccinated animals, whether horses, cattle, or sheep, from splenic fever as effectually as Jenner's vaccination protects the human subject from small-pox. To publicly demonstrate its efficacy the other day he vaccinated twenty-five of fifty sheep placed at his disposal. A fortnight afterward the whole fifty were inoculated with the most virulent "anthræcoid microbe"—the infectious germ of anthrax. The twenty-five vaccinated sheep resisted the infection; the twenty-five unvaccinated sheep died of splenic fever. Small wonder that within 50 hours of that time his energies were taxed to meet the demands of farmers for supplies of the vaccine, or that within 25 days he and his assistants vaccinated more than 20,000 sheep and a large number of cattle and horses in the departments surrounding Paris. Two other kinds of virus attended with similar results have also been discovered by him, and all his experiments will soon be communicated to the public. So great a benefactor of the public deserves the thanks of all classes and all nationalities, and among the first we hereby inscribe ourselves, in our own name and that of the American agricultural community, the grateful admirers of Professor Louis Pasteur.

FANCY STOCK AT THE FAIRS.

WE WERE at an agricultural fair when a farmer and his young wife were passing some cattle pens where a herd of fine cows were on exhibition. "Oh John! do look at these beautiful cows," said the wife, arresting her husband and leading him to one of the pens. "Isn't she a beauty? What a bag she has; and what beautiful yellow skin. Why could we not have some cows like that." "Oh, come along," replied the young farmer, those cows are not for us; they are fancy stock only good for show."

There the young farmer made a grievous mistake. Everything to be seen at the fairs is for the farmer. But he must not be misled by the appearance of the animals on exhibition. They are made to look their best by every art of the breeder. The tails are often tied up at night in wet straw bands to make them appear thin, the horns are scraped and sand-papered and waxed; the hide is washed with colored water to make the skin yellow and the hair is washed and oiled to make it shine. The cows and bulls are fed plenty of rich feed and come to the show in "show condition." This is all reasonable and unobjectionable. A fair is intended to please by its attractiveness, and we expect to see everything put on its very best appearance. Besides it is important for farmers to see how fat beef stock, pigs and sheep that are intended for fattening purposes can be made, because this is the chief end for which this stock is kept and is valued.

But farmers should be informed of the real actual value of the improved stock exhibited at fairs. A difference in the yield of milk of four quarts a day, even at two cents a quart is equal to $24 a year, which is the interest at six per cent. on $400. A difference of 100 pounds of butter in a year is equal to the same amount. With ten cows, this counts up pretty fast. A pure-bred Ayrshire or Jersey cow will easily make this difference in the value of the yearly product, as there is no extra cost for the keeping, the increase is all profit.

THE PUBLIC DOMAIN.

IT SOUNDS a trifle sensational to say that at the present rate of settlement the agricultural portion of our public domain lying within the arable region, will be all taken up within three years. Yet that is precisely the estimate of the the Public Land Commission which has just completed its labors and made its report which cannot, however, be printed for public distribution until Congress shall have made an appropriation for the work. The Land Office tells us that in 1879 the surveyed arable agricultural lands capable of cultivation without irrigation or other artificial modes of watering and subject to entry under the Homestead Act, embraced not more than 25,576,960 acres made up of comparatively small sections in Wisconsin, Minnesota, Dakota, Nebraska, Kansas, Washington Territory, and Oregon and still smaller areas in some of the other States. In addition to this, the estimated area of vacant surveyed public land is 15,180,256 acres in the following Southern States: Florida, Alabama, Louisiana, Mississippi, and Arkansas. These are the only States for which there is a general act of sale according to which all these lands are open to private entry at $1.25 per acre, except some "mineral tracts" in the Huntsville and Tuscaloosa districts, Alabama. Altogether of surveyed and unsold public lands there still remain, it is estimated, 189,622,455 acres, most of which, however, is either "mineral" or "coal" or "timber" land, and therefore not included in the "homesteadable" area, or else barren land or land suitable for grazing, but not included in the "arable limits." The total area of public domain yet to be disposed of is estimated by the Land Office at 1,163,946,438 acres. This large estimate includes not only all the agricultural lands within the arable limit, as well as the public domain in the Southern States and the surveyed but unsold Western lands, but also the vast area of partially unexplored and totally unsurveyed land west of the Mississippi, including the 369,529,600 acres of Alaska. During the fiscal year of 1880, 7,000,000 acres of the public domain were entered for settlement, and at this rate of absorption it is estimated all available agricultural land within the arable region would be taken up before June 30, 1883; while the total area of unsold public domain would furnish 7,274,665 homesteads of 160 acres each.

BREVITIES.

THE Wall Street brokers divide themselves into two great classes—bulls and bears. There ought to be a third—jackasses.

OUR first page cut of Messrs. Engelman, Sargent & Skinner of last week, was re-engraved from the London Gardeners' Chronicle.

THE latest news respecting the President's condition, as we go to press, are disheartening. A poor night with continued nausea and a higher temperature is the gist of the report.

WE have received from a friend, a panicle of "Russian White" Oats which measures 18 inches in length and bears 122 spikelets. This is longer than any we have seen in our own crop.

IRRIGATION FOR THE WEST.—It is said that Commissioner Loring will form a commission of thoroughly skilled engineers and scientific men to consider the feasibility of artesian irrigation for the Western plains. He will do well to consider this. Large tracts of land worth millions of dollars may, by a successful method of irrigation, be rendered yet more valuable and productive. We imagine that there is no way the Commissioner can better work into the good graces of the farmers of the great West than this; so now is his opportunity.

PROHIBITION has been defeated in North Carolina by the negroes, by the very people for whom it would be the best. Under the influence of United States marshals and others for whose interest it is to make the receipts from the sales of liquor as large as possible, the negro vote was thrown against prohibition. The best element in the South was in favor of it, but as it happened the decision was made by the votes of those who had been deceived, and led to believe that prohibition meant that their rights as citizens were to be taken away.

SINCE the French decree issued last February against the importation of American hog products, there has been a falling off of from 12 to 15 per cent. in importations of American meats into Switzerland. Into the cantons of Berne and Zurich American meats are introduced only under invoices that make it appear they came from Germany, the local butchers having influenced the cantonal authorities to refuse admission to American bacon and hams, on the unofficial certificate of a private inspector. It is only in these two cantons, however, that any discrimination is made against American meats.

RECENT investigations show that the following is a fair statement of the degree to which the hogs of the various places mentioned are affected with trichinæ;—"Of native Swiss pork, one piece in 2 000 is affected; of pork from Berlin and northwestern Germany, one piece in 250; of Westphalian pork, one piece in 200. Among the hogs in Brunswick, one in 5,000 is affected; of those in Gotha, one in 1,800; in Schwerin, one in 550; in Kiel, Prussia, one in 200; in the Lower Rhine Valley, one in 100; and in some parts of Sweeden, one in 63. It seems that our government ought rightaway to prohibit all European importations of hogs and hog products—especially German sausages—in order to preserve our citizens from that dreadful *European* disease, trichinosis.

IN the case of Kimball *vs* Adams, tried before the Supreme Court of Wisconsin in May 10, the facts were these: Kimball had built a permanent fence by mistake on land adjoining his own. The land was sold by the owner to Adams who took up the fence and put it to some other use. When the fence was built there was no agreement as to its removal, and Kimball brought an action against Adams for its value as personal property. The Court, through Judge Cassoday, decided that the building of a fence upon land as a permanent structure, in the absence, of any agreement that it might be removed "will necessarily convert the material of which it is built from personal property into reality." The judge added that the fence in question having become a fixture and the title to it having passed to Adams with the title to the land, it followed that he had a legal right to pull it down and dispose of the material as he pleased.

THE RETURNING PROSPERITY and the promises of better times, have in a measure turned the heads of the public; and too many people are misled into the hope of making themselves rich at a stroke by some fortunate speculation. Does it ever occur to a speculator that no one ever made a dollar by any speculation, that some other person did not lose; that no value is added to any property by buying or selling it, and that the prices of most speculative property are utterly fictitious? We have no desire to "run down" railroad or mining property, or to make it appear that it is of no value, but it is a fact that is undeniable, that the greater part of the stocks that are dealt in by speculators have no basis of value at all; that the railroad stocks known as the fancies are overwhelmed with bonds and mortgages and that the greater part of the mines which are now especially favorite investments for speculation are "stocked" at amounts enormously greater than any real value that the wildest estimates could approach. But yet the sharpers who thrive by this business are continually engaged in inveigling farmers and country people into their nets of speculation, and fleecing them of their hard-earned money. The amount of money that is constantly flowing into the pockets of stock brokers is amazing. It is to be reasonably estimated at a yearly sum larger than the revenue of the United States government. It has contributed to the vast wealth of the so-called magnates of Wall Street, who sum up their riches by millions and some by scores of millions; every dollar of which has been made by no process of honest productive industry, but by speculations in which they have gained what thousands have lost.

Literary Miscellany.

OBSERVATIONS OF REV. GABE TUCKER.

You may notch it on de palin's as a mighty resky plan
To make your judgment by de clo'es dat kivers up a man;
For I hardly needs to tell you how you often comes ercross
A fifty dollar saddle and a twenty dollar hoss.
An', wukin, in de low-groun's, you diskiver as you go
Dat de fines' shuck may hide de meanes' nubbin in a row!

I think a man has got a mighty slender chance for heben
Dat holds on to his piety but one day out of seben,
Dat talks about de sinners wid a heap o' solemn chat
An' nebber draps a nickle in de missionary hat;
Dat's formose in de meetin'-house for raisin' all de chunes,
But lays aside his 'ligion with his Sunday pantaloons

I neber judge o' people dat I meets along de way
By de places whar dey cum fum an' de houses whar dey stay;
For de bantam chicken's awful fond o' roostin' pretty high,
An' de turkey-buzzard sails above de eagle in de sky;
Dey ketches little minnies in de middle ob de sea,
An' you find de smalles' 'possum up de be biggest kind o' tree! —Scribner's Monthly.

COUSIN FRED.

CHAPTER I.

DISCOVERY.

"This is the second time! It's singular, to say the least of it, let alone mysterious. Who can the little figure dressed in gray be? I'll not rest until I find out!"

* * * * * * * *

"Lucy, cousin Fred is coming down again to-morrow. Think of that! Why, he only left a fortnight ago. He certainly must find some particular attraction in old, dull Silverville;" and with a laugh the speaker took a furtive glance at herself in a looking-glass. "Nevertheless, I am awfully glad, aren't you?"

"Yes indeed; it's always a pleasure when cousin Fred comes," responded the young girl addressed, looking up from the book she was reading in the large bay drawing-room window of Silverville.

She was a quiet, graceful-looking girl of about eighteen, with delicate features; large, brown, thoughtful eyes; soft, plainly braided brown hair; unassuming, ladylike manners; and was neatly attired in a dark costume, relieved by snowy collar and cuffs and a becoming ribbon at the throat—altogether as great a contrast as could be to her handsome cousin, Linda Brand, the heiress, who was fair, with rather classical features; a tall erect figure; and a toilette as bright and pretty as the flowers on the lawn.

An only child—Linda Brand, spoiled from infancy, was proud of nature, petulant at times, and inordinately conscious of the prestige which the being an heiress gave her.

Lucy, on the other hand, was penniless: having been taken out of charity, when a little more than an infant, by her Uncle, Mr. Brand, and supported by him.

"How calmly you take it!" exclaimed Linda, with a movement of her pretty head, as she arranged the tiny flower-wreath about her white throat. "You're awfully ungrateful! I don't think you care for Fred a bit! Yet he's very kind I am sure, to you," in a condescending tone, which the speaker often used from habit in addressing her younger cousin.

Lucy Brand raised her head quickly; a delicate color was on her cheek.

"Not like cousin Fred!" she exclaimed; then coloring deeper, and as if ashamed of her earnest protest, she added, with a little laugh, "Of course I like him, Linda, but you would not have me care for him too much, would you?"—a laugh—"though, if I did, there would be little danger of his caring for me, would there?"

Linda laughed too, tried to look conscious, but failed. She had a score of lovers, and such innuendoes as Lucy's were familiar; though certainly as yet handsome cousin Fred had won her preference.

"No, there would not, I suppose, be much danger," she rejoined placidly; "but I never meant that. I've put you down, you know, for a curate; you are just the neat, quiet little person to go doddling among your husband's parishioners, darning his socks, and attending Dorcas meetings."

"Well, one might do worse," said Lucy quietly.

"Oh, of course! There's a place for everyone in this world. Now, I should no more do for yours than you for mine. What a delightful morning it is! I'm off for a row."

Lightly she passed through the open window and across the lawn, shadowed by silver beeches, towards the river.

Leaning, forward, her elbow on her knee, her chin in her hand, Lucy Brand watched her, an expression half sad, half amused, in her eyes.

"Not do for my place any more than I would do for hers! I wonder, if our childhood had been changed--mine hers, hers mine—whether then it would have been so? Circumstances have much to do in forming natures. I think——"

She paused, then added:

"Not like cousin Fred! Would to Heaven I did not! then one trouble of my life would be removed.

For a second time she paused—for a second time she proceeded, now rather bitterly:

"No; there would be no danger of his caring for such as I! None. I must be content with the curate and sock-darning! There, how foolish I am!" and she dashed away a tear. "Everyone would say I ought to consider myself a most fortunate young person; only, as Linda says, I suppose I am ungrateful."

Rising, she went to give orders about the preparation of cousin Fred's room; for though two years younger than Linda, the duties of housekeeper were passed to Lucy.

In due course cousin Fred arrived. There was little wonder that both Linda and Lucy liked him, for he was one of those handsome, manly, good-natured, genial specimens of masculine humanity that is a favorite with all.

"How kind of you to come down again so soon!" remarked Linda, gaily, on greeting him.

"I am glad, fair coz, that I am so welcome," he rejoined. "Ah! beauty is a greater magnet than steel, isn't it? And you, Lucy, are you not going to say I'm welcome?"

"Indeed, yes, Fred; though there is scarcely need to state that of which you are so sure," She smiled, extending her hand.

He took it; but the light that was in his eyes when he spoke died out. Cousin Lucy was the strangest girl he ever knew—why did she not care for him like Linda? He told himself that he tried to be kind, but she was always drawing away or answering his approaches so indifferently.

"Well, Fred, so here you are again," said Mr. Brand, entering. "What has brought you down, eh? Pleasure or business?"

"Both, uncle, I may say. I have been offered a fine position by my father's old friend, Mr. Melbroke. I need not say," with a laugh, "I have accepted it; for Mr. Melbroke says it may lead to a lot of other good things. So before I start I thought I would run down and spend a few days at Silverville.

"Oh! delightful—charming!" Linda exclaimed.

"I congratulate you, Fred," added Mr. Brand.

"Thanks; I knew you would, uncle. Yes, it's a good thing."

Then cousin Fred's eyes strayed round the room, having missed a third voice; but Lucy, unperceived, had disappeared.

As pale as death, she stood bene ath the veranda, one hand pressed to her heart.

"He has come to ask Linda to be his wife," she murmured. "I know it! Well, have I not known this all along? Have I not expected it? And why not Linda—Linda as any one? is it not the same to me? Only it is hard to bear. How foolish I am. Am I the only girl who has loved without return?

Later on she came to cousin Fred, a bright smile on her face.

"Is it true," she said, "what Linda tells me, about your going away? I am so, so glad! I congratulate you so much!"

"Yes, Lucy, I'm off. You'll be glad to get rid of me, eh?"

"I!" She could not help it, the tears sprang Quickly she averted them before she had seen the expression in his, and with a forced laugh, added, "Ask Linda—if she can bear your departure, I must try to."

He dropped her hand, and she moved away, not seeing the look of half pain, half anger on his features.

There were rarely dull moments at Silverville when Fred Beaufort was a guest. The dullest, in Linda's estimation, was the after-dinner period when she and Lucy were alone in the drawing-room, and the gentleman remained over their wine. If cousin Fred had any great fault it was smoking, and the hour his uncle dozed he enjoyed his cigar. It was the fourth evening after his arrival, that directly Mr. Brand had emptied his wine-glass and thrown his handkerchief over his face, Fred Beaufort, lighting a fresh cigar, passed into the grounds.

The night was calm and warm; but it was evident that was not the cause that attracted him, for directly he had got beyond the light issuing from the dining-room, he increased his pace and walked, with an undoubted purpose, obliquely through the grounds. Entering finally the wooded portion, he came out by the river, just where the willows drooped most thickly. Here he threw himself down among the ferns, extinguished his cigar, and waited.

In a few moments he raised his head slightly. There was the soft sounds of oars. Soon a boat containing one person loomed through the gray twilight, and stopped just opposite him at the other shore. Watching, he saw the figure—which, man or woman was clothed entirely in a somewhat loose gray garment with a hood—attach the boat, land and disappear among the trees.

Fred Beaufort drew himself higher up under the willow. There was no mistake about the boat. It was the one belonging to Mr. Brand; he knew it by the red and white water-line. Then he uttered the sentences which commenced this chapter.

The previous evening while smoking his cigar, he had chanced to stroll in this direction, and had seen the boat arrive as it had to-night. In less than half an hour the gray figure had returned, got in and rowed away. Fred had followed along the bank, but bushes had intervened and he had lost sight of the little craft.

Why, he hardly knew—he had mentioned the circumstances to no one—but with the curiosity of an idle man, noting the time, resolved to watch the next time—the thing surprising him being the use of Mr. Brand's boat.

Again the solitary rower had appeared and acted in the same manner; and now he determined to find all out. No one had any right to use the boat but Mr. Brand's own family. If some maid were carrying on clandestine meeting with a lover, they had no right to use the skiff, which might create mistakes not pleasant to his cousins, for he was assured now that the rower was a woman.

Hardly had half an hour elapsed when the gray figure re-appeared. Fred, who had already risen was about to move away along the bank, when he perceived the figure look back, and then he saw another figure just shadowed under the trees; then, with a motion like a wave of the hand, it went back, as the rower, taking the oar, shot the boat along the silent river.

This time Fred Beaufort was prepared for the bushes, and skirting them quickly, managed to keep the boat in sight, himself unseen. Rapidly it proceeded until it turned into the pretty little red-and-white boathouse; there he was able to overtake it, and concealing himself among the trees, wait for the rower to issue forth.

Speedily she came, but the gray mantle was now carried under her arm. She walked hastily, yet with caution, passing within a foot of him.

Fred Beaufort gave a great gasp, for he recognized his cousin, Lucy Brand.

The slight sound he had made when he started at the discovery reached her. She halted and glanced round. The expression of her face was pale and troubled. Believing she had been deceived in the noise, she hurried on again, and Fred Beaufort followed slowly, heavy at heart.

Whom did Lucy go thus stealthily to meet? Could it be a lover? Then why clandestinely? If he were not worthy to come to her home, then he was not worthy of Lucy. Ought he to tell his uncle? What danger might not Lucy be running into?

But there was reason why he shrank from himself being Mr. Brand's informant in this matter; and yet undecided, he approached the drawing-room windows. Ere he entered he heard a light touch on the piano, and soon Lucy's voice, sweet, clear, and sympathetic, broke forth, singing—

"'My heart is sair to sickness,
Ne'er may I smile again:
My een will aye be greeting,
For bitter is my pain.'"

The pathos of her voice thrilled Fred Beaufort, He listened until the song ended, then:

"No, by George, I can't tell uncle!" he thought. "Only one who feels the words could sing them like that! Poor Lucy is in trouble, and has a sad heart! Perhaps she loves some one that uncle does not approve of—then *I* know my fate. Bah! as if I ever had any chance! Never!"

Yes, Linda Brand was right. Cousin Fred had a particular attraction at old, dull Silverville, and the attraction was Lucy.

To be continued.

MAGAZINES FOR AUGUST.

HARPER'S MAGAZINE.—Contents: Frontispiece, Illustration for "Almond Blossoms;" The Surrender of Cornwallis; Almond Blossoms, a poem; A Day in Africa, II.; The White Mountains, III.; The Parcæ, or, Three Dainty Destinies. The Armelet; Anne, a novel; Left Behind, a poem; Then; The Various Languages of Billy Moon; A Neglected Corner of Europe, III.; Water Routes from the Great Northwest; Miss Pickett; Assassins and Nihilists; Sheltered, a poem; President Madison and the Baptist Preacher; A Laodicean; Editor's Easy Chair; Editor's Literary Record; Editor's Historical Record; Editor's Drawer.

CIRCUMSTANTIAL EVIDENCE.—A lawyer in Central New York gives the following account of one of his first cases:—

"My client sued a neighbor for the alleged killing of a favorite dog. The proof consisted in the mysterious disappearance of the animal, and the possession of a dog's skin by the defendant, which after considerable argument, was brought into court in evidence. It was marked in a singular manner, and was positively identified, with many tears, by the plaintiff's wife and daughter as the undoubted integument of the deceased Bose. In summing up to the jury, I was in the midst of a highly colored picture of the virtues of the deceased, and of the love of the children for their four-footed friend, when I was interrupted by a slight disturbance in the crowd near the door of the little school-house which served as court-house. Looking around, I saw my client's youngest son, a tow-headed urchin of twelve, coming forward with a dog whose skin was the exact counterpart of the one put in evidence. The dog wagged his tail with good-natured composure, and the boy cried, in his childish treble, 'Paw, Bose has come home.' I gathered up my law books and retreated, and I have never had perfect confidence in circumstantial evidence since."—Editor's Drawer, in Harper's Magazine for August.

LIPPINCOTT'S MAGAZINE.—Contents: A Glimpse of the Cumberland Border—first paper; The Home of the Giant Squid: Thalatta: Craque-o'-Doom, a story: New Ground; Before the Dawn; Captain Put's Novel; Zoological Curiosities—V., Secretiveness; Flowers; On the Wrong River; New York's Fresh-air Fund; Santa Lucia; The Pension Office: Going to Housekeeping in North Carolina; Our Monthly Gossip: Art Matters, Anecdotal and Miscellaneous; Literature of the Day.

THE PENSION OFFICE.—The first law providing pensions for deaths and disabilities incurred in the War of the Rebellion was approved on the 14th of July, 1862. Since then the Government has paid in pensions more than five hundred millions of dollars. The payments for many years, up to 1879, averaged about thirty million dollars a year. During the fiscal year ending in 1879 the payments rose to nearly thirty-four million dollars; and in that ending in 1880 they went up to over fifty-seven million dollars. For the current fiscal year nearly seventy millions have been appropriated, but nearly a hundred millions will be needed.

The highest pension known to the general law is seventy-two dollars a month; the lowest is one dollar a month. In cases of surviving soldiers, the rates are graded according to the degree of disability for manual labor found to exist in each case. As a matter of fact, the disabilities of many do not interfere materially with their ability to gain a livelihood. A jeweler or dentist with one foot may earn his living as well as with two. The law pensions all, however, as if they were hewers of wood and drawers of water.—Lippincott's Magazine for August.

THE ATLANTIC MONTHLY.—Contents: Dr. Breens Practice, I-III; French Domestic Life and its Lessons; Corda Concordia, read at the Opening Sessions of the Summer School of Philosophy; Concord, July 11, 1881; In Exile—a story in two parts, Part I.; The New York Art Season; On the Acting of Iago; The Portrait of a Lady—XXXIX-XLII; Sleep's Threshold; The Indoor Pauper: a study; Tidal Waves; Recollections of James T. Fields; Parton's Life of Voltaire; Ward's English Poets; The Contributors Club; Books of the Month.

CLERICAL ORATORY.—Why do not our preachers study oratory? As preachers, not pastors, their business is to work a certain effect, and all helps to its production it should be a part of their education to learn. I presume I shall not be misunderstood to mean the effect of displeasing self and winning admiration for personal gifts. What the true preacher seeks to do is to inform the intellect with Christian truth; to stir the heart, and thereby influence the will, of his hearers. Half the sermons annually preached are, so far as human insight goes, a waste of labor and breath. Two things partly account for this: one is that a majority of the men set to preach are out of their real vocation,—good pastors they may be, but fit preachers they are not; another is that those with more aptitude for preaching do not yet understand the means to be employed to attain their object.

Sometimes the preacher has some conception of the needs of human nature, and knows that the truest truths fail to move when put before men in a dull, dry way; perhaps he does his best to acquire a good style, and succeeds in making an ably-written discourse. But when he comes into his pulpit to give it to his people, where is the impression it should produce? What becomes of his choice words, his considered sentences? There they lie upon the page he holds; he proceeds to read them. Why do they fail of any result? It is for want of delivery, of the oratorical art of making mere words "tell." His faithful effort goes for little; he seems to his hearers to be reading something to them, as he is,—not to be speaking to them from the heart.—August Atlantic.

NORTH AMERICAN REVIEW.—Contents: The Christian Religion; Obstacles to Annexation; Crime and Punishment in New York; A Militia for the Sea; Astronomical Observatories; The Public Lands of the United States.

CRIME AND PUNISHMENT IN NEW YORK.—It is not the purpose of this paper to present the statistics of crime in the city of New York, but to exhibit some of the principal causes of crime which are here in operation, and the inadequacy of the administration of justice to meet the case. A large city presents the greatest advantages and incitements to deeds of fraud, sensuality and violence, by the denseness of the population and the facilities of concealment. Temptation is multiplied and the risk of exposure diminished from the same cause. The latter fact draws evil characters to a large city, and the former manufactures evil characters from among the citizens. But New York is not only a large city, but it is a seaport, and the principal gate of immigration to the United States. Men of every clime throng its streets, and nearly one-half of its population has no personal or inherited interest in American institutions. The worst elements of European society are constantly brought into this civic caldron—in many cases the emptyings of almshouses and prisons. It is no light task to meet this onset of depravity with the firm hand of order, and to make this heterogeneous mass take on any assimilation to the general constitution of American life. Too much has been said thoughtlessly of the misgovernment of this metropolitan city, where the critics have not considered the peculiar obstacles to social order to which we have referred. The real wonder is that New York is so well governed—that, amid all the antagonisms to public peace which are found in it, it is, on the whole an orderly city, and offers attractions for residence beyond any other city in the Union. There is far more rowdyism and drunken rioting in Glasgow and Liverpool than in New York; and the streets of New York, which have formed the theme of so much indignation because of their unclean condition, are pure and spotless in comparison with the streets of the cities of Southern Europe. It has become popular to condemn New York, and to call it a modern Sodom; but nowhere in the world are so many and so mighty agencies in active operation for the material and moral welfare of the community. Churches, hospitals, charity homes, schools, libraries, galleries, benevolent societies and other forms of gratuitous help to the comfort and welfare of the city abound, and a general liberality toward all measures tending to elevate the tone of society is very conspicuous. It is, then, with no cynical feeling that we endeavor, in this article, to show where effort is still lacking and where remedies ought speedily to be applied.

We have taken New York City as our text, because of that city we have a thorough and accurate knowledge; but the principles, as well as the facts, will doubtless apply to all the large cities of our country, and hence our article, we trust, will not have a merely local interest or value. We have not used rhetorical appeals, or spread before our readers heart-rending pictures of vice and and crime. We wish to arouse something deeper than emotion or sentiment. We wish to convince the reason and establish a firm basis of principle from which systematic action may be expected to grow. The appeal is to the common sense of citizens. We have no patent theory, or radical measure of moral reform to propose; but ask our fellow citizens to take time to consider this great fundamental question of crime and punishment in the community, to see what their duty is in the premises and to do it.—Howard Crosby, in North American Review.

For Women.

CONDUCTED BY MISS RAY CLARK.

OUR COLLEGE GIRLS.

I PASSED them on the thoroughfare,
  One hundred college girls;
A wavy line of faces fair,
And Summer robes, and ribbons rare,
  And speaking lips, and eyes and hair,
  In tresses, bands and curls.
And later, as through porch and aisle
I saw the bright procession file,
It lightened, like a living smile,
  The shadows that unfurls
The reaches of cathedral rooms.
I blessed them for their rosy blooms
Of cheek and lip; for nodding plumes
  And fans that made their breezy swirls;
For breastknot flowers and soft perfumes;
For brightness in a world of glooms;
  Our bonnie college girls!

Intent they watched the speaker's face,
  Our quiet college girls;
And as the great thoughts grew apace
And bloomed in words, 'twas good to trace
The impress of their royal grace
  On youthful brows. The pearls
Of wisdom sought and found for them
Were wasted not. Each shining gem
Was gathered to the diadem
  The spirit wears; and whirls
Of eloquence that clustered round
The central stalk of thought profound
Were grasped of all. But quick rebound
  Comes when the college father hurls
The name for which each prize is found.
How cheer the small hands, round on round!
  Our generous college girls!

But other gifts the searcher finds
  In these, our college girls:
Eyes that are set to read the lines
Of life in hieroglyph, the signs
Of coming change, the world divines
  But dimly in its whirls;
Hands that are skilled to turn the keys
That lock the world's best mysteries;
Brave, earnest hands, outthrust to seize
  The rugged husk that curls
About each corn of truth; that hold
The book of snow and pen of gold
For nineteenth-century thought, untold
  Upon the passing year that furls
Its scroll to-day; true-voiced, true-souled;
Their names are on our hearts enrolled;
  Our noble college girls!

TIGHT LACING.

THIS is a subject which bears much comment and should be heeded by all women. In consideration of the importance of this question we make the following extract from the Lancet: "A verdict was lately returned by a Coroner's jury which is quite as applicable to not a few cases of premature death which do not happen to be made the subject of medico-legal inquiry. It is difficult to speak with moderation of the folly of tight-lacing in view of such facts as these, especially as no attention seems ever to be paid to the warnings repeated *ad nauseam* against irrational and unhealthy modes of dress. Physiology does not enter into the sphere of the "fashions," the follies of which are productive of more suffering and ill-health than people are willing to concede. In spite of satire on one side and admonition on the other, there seems to be but little diminution in the degree to which these vagaries are carried, as may be proved by any one who walks abroad during the hight of a London season. Why is it that in this matter of "tight lacing" there should be such tenacity, for there is hardly any subject that has been so unmercifully and yet so necessarily criticised as this? There are only two possible reasons for its maintenance—the one that it is indispensable to the present form of female attire, and the other that it is believed to lend grace to the wearer. Neither of these contentions can seriously be maintained in the face of the known evils which follow the practice, but they are at present ideas so firmly rooted in the female mind that their dislodgment is not easily effected. Now and then, indeed, there seems to be an attempt to introduce a more rational style of dress, but such attempts are rarely successful, owing in a great measure to the disposition to ridicule new departures which do not harmonize with the "mode." The medical profession has never ceased to express its opinion upon the evils of tight-lacing, being well aware of the derangements for which the practice is responsible. To be effectual, however, such remonstrances must be given not only to those who follow the practice, but to those who either tacitly or openly encourage it. We are treading, we know, on delicate ground, but it is time there should be plain speaking, even at the risk of giving offence, for it must be confessed—and it is no disparagement to the fair sex to admit it—that so long as men persist in regarding an unnatural deformity as a beautiful object, so long will many women do their utmost to become "beautiful," no matter how painful the ordeal to which they will have to submit.

A well-known writer upon female dress not very long since admitted that it was the object of women so to dress as to render themselves attractive to the opposite sex, thereby following out a law which obtains throughout animal creation, and of which there is no denying the truth. But the same author spoke out boldly against the practice of tight-lacing, showing that in her opinion, at any rate, the practice was not essential for the purpose above stated. In all seriousness, it is a pitiful thing that in these days, when all our youth can obtain an insight into the principles of physiology, there should still prevail a practice so unphysiological as that of which we speak. It stands to reason that long-continued, firm compression of the lower ribs cannot be indulged in with impunity. The dorsal, thoracic, and abdominal muscles are rendered feeble from enforced inactivity, respiration is impeded, circulation is carried on under greater strain, and the viscera are displaced to a remarkable degree. In the case which forms the text of these remarks, not only was the liver deeply indented and displaced but the stomach was constructed into two portions, and both of these effects have often been observed before. The affections attributed to tight-lacing are many and various—some perhaps without sufficient ground; but most certainly respiratory, circulatory and digestive derangements not to mention difficulties and danger in parturition, are directly traceable to tight-lacing. Such derangements lead the way to other and graver changes; they may cause many ailments which render life a misery, or eventually lead to the premature extinction of life—not perhaps directly, but by rendering the organism unable to cope with disease, however arising. Once more, then, we urge the female members of the community to abandon this fatal practice; its utilitarian purpose could no doubt be supplied by means at once more simple and less injurious; and its æsthetic function exists only in the imagination, being grounded on the false and perverted notion that the natural contour of the body is ungraceful, whilst the deformed, contracted "waist" is considered beautiful in proportion as its constriction is extreme.

FASHIONS.

SOLID colors are most fashionable in hosiery. White will be fashionable again.

"Dawn" is a new shade of pale gold.

Sateens are extensively used this season, which is not surprising when such tempting and charming patterns are offered.

Yellow, red and olive green guipure lace has appeared.

Brick-red and olive-green shades prevail among the chintz-figured foulards.

Stylish evening wraps are eastern in texture, color and design.

Pink and red barred zephyr ginghams are made up with many pleatings edged with black thread lace.

A great deal of "rip-rap" trimming, i. e., lace made of serpentine braid, is used on ginghams and linen lawns.

Bracelets made of old silver medals, linked together with silver beads, are the fancy of the moment.

The Lucia cape is one of the daintiest of fashionable little mantelets. It unites the coachman's cape and a small Capuchin hood, and is composed of a variety of material for demi-saison, and for long Summer days.

Surah petticoats of pale blue, pink, or corn color are worn under thin, white evening dresses. The underwaist of the white bodice is also of the colored surah, and is cut low in the neck, and with short sleeves

Shoes are now made with low, broad heels, placed where heels belong, and not under the center of the foot, which show for all they are. Women with large pedal extremities are opposed to this change, naturally enough.

Gathers run riot this season, and we now find every article more or less ornamented with them; for instance, the new walking dress is gathered on each shoulder, while the latest novelty in night-dresses is to gather the yoke and cuff. Everything in Hubbard form is the leading style, and the Hubbard polonaise, Corsage-Basque, waist-bodice, and pinafore polonaise, are all the rage for soft fabrics, although we still find that useful garment—the polonaise, still worn, also the princess dress with scarf drapery.

For ordinary traveling use, when the color of the dress is not matched, black hats are the favorite selection for old and young. Whatever they require in jauntiness, to be properly becoming to a school-girl, they gain from the gipsy shapes and fantastic brims of the present modes.

Among rich fabrics imported for polonaises is black China crape, embroidered all over in black in Oriental designs of pagodas, birds, butterflies and the favorite flowers of the East—chrysanthemums, peonies, etc.

White associated with gold, is the fancy of the moment both in bonnets and in costumes.

Large linen collars worn with yachting suits have a wide hem, and just above, a broad blue or red stripe. On imported collars the color is stamped; on designs made here, a colored band is inserted at half the width of the collar.

The advancing season has shown that the predicted change to large hats is gradually taking place. Each new importation contains larger and more elaborate shapes than the last.

One of the novelties in belt decoration is the fancy for large bows worn directly in front or a little to one side of the belt. They are very stylish, and will be much worn during the Summer.

Watered silks or *moires* have reappeared, and are employed for combination toilettes. Varieties which come in delicate colors have large watered stripes occurring between stripes of satin.

Ribbons with mixed colorings—called harlequin ribbons—are extensively used now, and the block or checker-board kinds are equally admired. Toilettes made of brocaded and plain fabrics combined are decorated with knots of brocaded ribbon or brocaded silk, doubled.

Flower and fruit bonnets are composed of wire shapes over which tulle or net is puffed, and concealed by a flat wreath either of fruit or of flowers, the leaves being laid flat upon the crown and thus concealing the foundation. All such hats are of the capote form.

Initial pins are among the newest fancies approved by fashionable young ladies. The first name of the young lady is written in silver, each letter being clearly cut and separate from all the others; the imitation of a running handwriting is exceedingly good, and the flourish at the end of the name is turned back and under, forming the pin. The device is novel and effective, and before long one will be able to discover the name of any fair damsel one may chance to meet by simply glancing at the pin which holds in place the silken tie or is half hidden in the folds of the creamy lace scarf.

MRS. ELIZABETH PEABODY, the sister of Mrs. Hawthorne, is in failing health.

MRS. COWDEN CLARKE has nearly ready a new and revised edition of her Concordance to Shakespeare's works.

MRS. GARFIELD has received a gift of beautiful glassware from some American manufacturers who were so unselfish and considerate that they sent the ware through another firm, and would not allow their names to be mentioned.

NOTE.

IN issue of July 30, Mary E. Burroughs mentioned the price of flannel suiting of single width at 50 cents; this is correct, of course, as applying to the quality to which she refers but for the benefit of those who are obliged to be extremely economical it may be well to state that an inferior, yet very good quality in double width can be purchased for 50 cents.

The Solid South, to a woman, are for Hop Bitters, using them as their only family medicine.—*Adv.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

SODA FOR HEAD-ACHE.

IN the RURAL of June 25th W. M.. says: "To use soda for headache will be making a remarkable leap toward confirmed dyspepsia." It has been in the past a hygienic hobby that soda was injurious to health, even in biscuit, but I hold that other ingredients did the mischief and soda got the blame. If you take into your stomach an over-dose of opiates or any other detrimental substance, will you not take something to neutralize it? Assuredly, yes. So, also for excessive acidity of the stomach soda is an antidote, neutralizing the acidity, and so likewise the acidity neutralizes the soda. I have practiced carrying a vial of soda in my pocket for several years for the purpose of neutralizing the stings of insects, but find its use internally of inestimable value. One-eighth of a teaspoonful can be taken at intervals of an hour with remarkably good effect in most cases of headache, pains in the stomach, attacks of bowel complaint, nausea, etc., etc. I was for a number of years afflicted with that dread dyspepsia referred to, and spent dollars for medicines and even had beer, wine and tobacco prescribed, and I half starved myself on hygienic diet. My stomach would not retain food and had apparently an indigestible brick in it, which would turn over and about, changing its position. I was working hard at manual labor when able, but never did I find instant and permanent relief until I took common baking soda, and by its use I am entirely cured, and now am not the least particular about my diet. I have noticed lime-water and milk recommended through the RURAL for dyspepsia. Are not lime and soda both alkalies and of the same kind? I have for years used soda myself; given it to my children even when infants; recommended it to my neighbors and friends, and have yet to see the first injurious effects from its use. In my judgment the abstinence from the use of soda as a family medicine is fast going the same road that the abstinence from the use of cold water in cases of fever went a number of years ago. J. M. M.

DRESS vs. DRAPERY.

A WRITER in the London Sanitary Record says that one radical mistake we make with regard to modern dress is to look upon it as an affair of drapery. Let us keep drapery for bed and window curtains; to cover statues or lay figures; but for the dress of women in the crowded, bustling life of the nineteenth century, it is totally out of place. We want to be clothed, not draped. The idea of beauty, therefore, derived from flowing drapery (and this seems to be the chief one of the so-called æsthetic school) is of no use to us, as not applicable to modern daily life.

Modern dress must learn to gain what beauty it can without the aid of superfluous drapery; from the beauty of the form it covers, from its graceful movements, and by discarding the false and hideous outline which fashion would give it. We must also put outside, at least for the present, the idea that art can improve nature; for this we must wait until we have obtained a more correct knowledge of the "nature" we have to improve. If not, the result will be what it always has been, the deforming and caricaturing of the figure rather than its improvement. We are even now threatened with the re-introduction of a specimen of this false taste. Crinolines are to be worn again, for the double purpose of "improving nature" by setting a hump on the middle of a woman's back, and of making her carry about a frame over which to hang "drapery."

DOMESTIC RECIPES.

Spiced Gingerbread—Excellent.

One cup of butter, one cup of brown sugar free from lumps, one cup of molasses, four eggs, one cup of sour milk, two teaspoonfuls of soda, four cups of sifted flour, a little salt, a teaspoonful each of ground cloves and cinnamon, a teaspoonful of ginger and a tablespoonful of grated orange peel. Mix the salt and soda with the flour. Beat the yelks of the eggs, then the whites, and then both together. Mix the molasses, sour milk and spice together, and cream the butter and sugar. Now drop the butter and sugar into the flour, add the eggs, stir a little, add the milk and molasses and stir quickly until a smooth mass. Bake in shallow pans in a well-heated oven. MRS. K. L.

Cheese Mixture for Sandwiches.

A quarter of a pound of good English cheese, grated, the yelks of three hard-boiled eggs, a tablespoonful of melted butter, pepper and salt. Rub the yelks to a paste with the butter and seasoning and work in the cheese. Cut thin slices of bread, butter, spread the mixture on evenly, cut and place one on the other.

Rice Meringue Pudding.

One generous quart of rich, new milk, a small cup of raw rice, a cup of sugar, four beaten eggs and two spoonfuls of butter. Soak the rice in a cupful of the milk for two hours, turn into a farina kettle with the rest of the milk and simmer till tender. Rub the butter and sugar together, beat the eggs light, and mix all with the rice until the mixture is very light. Put all into a buttered baking dish and bake 45 minutes in a moderate oven. When done, draw to the door of the oven and cover with a meringue made of the whites of three eggs, a spoonful of powdered sugar and the juice of half a lemon. Close the oven and bake until delicately browned. Eaten hot or cold.

MRS. J. MC.

Apple Layer Cake.

Two cups of fine white sugar, one-half cup of butter, one-half cup of corn-starch, one-half cup of sweet milk, the whites of six eggs, three cups of flour and two teaspoonfuls of baking powder. Cream the butter and sugar, add the milk, stir, then the corn-starch, and last the whites, beaten stiff, and the flour (with baking powder sifted with it). Bake in jelly-cake tins.

Filling.

Beat together one egg, one cup of sugar, and grated rind and juice of one lemon. Into this mixture grate three ripe, tart apples. Put at once—to preserve color—into a farina kettle or tin pail set within a kettle of boiling water, and stir until it boils. Let cool before spreading between the cakes.

Lemon Snaps.

A pound of powdered sugar, a quarter of a pound of butter, three beaten eggs, juice of two lemons and the grated peel of one, a teaspoonful of baking powder and flour enough to mix. Roll thin, cut into rounds and bake in a quick oven.

Lemon Extract.

The yellow rind—not the white—of eight lemons, a quart of white whisky or brandy. Cut the rind into bits, put into wide-mouthed bottles and cover with the spirits. Cork and shake frequently for two or three weeks. It will then be ready for use, and will be found superior to most of the lemon extract sold at the shops. MARY B.

A Nice Lunch Dish.

The remains of cold baked or boiled chicken cut into dice; the bones and skin put into a saucepan with a minced onion and water enough to cover. Boil an hour or longer. Strain, skim off the fat and return to the pan. Thicken with a tablespoonful of flour rubbed smooth in a half cup of cream, season with pepper, salt and minced parsley. After it thickens, put in the chicken and take from the fire. Butter a deep dish, strew thickly with fine bread crumbs, pour in the chicken, cover with fine bread crumbs and break fresh eggs carefully over the top. Put a bit of butter on each, pepper and salt and bake in a quick oven until the whites set. ECONOMY.

KEYSTONE WASHER.

MRS. V. A. in the RURAL of MAY 14, P. 327, inquires for experience in the use of Keystone Washers. I used one of the first made of this machine for seven years; it is now worn out and I have bought a new one. I find the new one is quite an improvement on the old; but there is no change in the work or principle. To be brief, I would say that the washer is as good as recommended; does good work with a great saving of water, soap, time, strength and patience, which are items of importance in domestic economy. It is not necessary to have your hands in the water, in which case suds can be used as hot as desired.

MRS. G. W. F.

QUESTIONS ANSWERED.

Chocolate Mixture.

Housekeeper asks how to prepare chocolate to put between layer cake.

ANS.—Whites of two eggs beaten to a stiff froth, a cup of powdered sugar, a quarter of a pound of grated or scraped chocolate, mixed smooth in a tablespoonful of sweet cream, a teaspoonful of vanilla. Stir the sugar into the whipped whites, then the chocolate. Stir all together hard for two or three minutes before adding the flavoring. The cake should be cold before spreading. Reserve a little of the mixture for the top and stir more powdered sugar into it to form a hard icing.

Or, to a cup of thin, sweet cream add a cup of powdered sugar, a quarter of a pound of grated chocolate and simmer until it thickens. You must be very watchful lest it burn. Take from the fire and whip in the beaten yelk of one egg. When somewhat cool, flavor with vanilla and spread while warm between the cakes. Do not frost the top but strew thickly with powdered sugar.

"My mother drove the paralysis and neuralgia all out of her system with Hop Bitters."—Ed. Oswego Sun.—*Adv.*

A Second Literary Revolution.

The first literary revolution consisted in the publication of standard books in every department of literature at from one-third to one-tenth of their former cost.

The second literary revolution consists in a still further very great reduction (conditional) even from the revolution prices, while, at the same time, the average quality of the books will continue to be materially improved.

How Can These Things Be?

To attempt an impossibility could of course result only in failure, and it would be useless, in our own interest, or in that of the many thousand customers who have shown us such earnest favor, and have given us such great patronage, to announce or promise what could not be performed. We have dealt frankly with our customers in giving facts concerning costs and profits in the past, and we do it now, by giving facts and figures illustrating how we can afford to still further reduce prices:—

Facts and Figures.

Please note, at the start, our apology for not having done heretofore what we now propose to do, and consider—

1st—We published our first book only so long ago as January, 1879. Previous to that time we were entirely without experience in book publishing. What knowledge we had of the business was gained in newspaper publishing and in book selling.

2nd—We were also at that time almost entirely without capital, and until so late as February, 1881, we labored under the difficulty of being without capital, even approximately adequate for the magnitude of the enterprise we were undertaking.

3rd—Our entire scheme was in opposition to all previous methods of publishing and book selling. And from the beginning to the present we have had the combined bitter opposition of almost the entire book publishing and book selling classes of the United States.

4th—Starting thus, with a minimum of knowledge, and less capital, and with such immense opposition, we thought it best, in the interest of both the reading public and ourselves, that we undertake too little rather than too much; partial success would be better than total failure.

5th—In spite of our want of resources and of experience, and in spite of opposition, and with the necessity of organizing and training our *new forces*, and necessarily trying many experiments, all of which no one could expect would be uniformly successful, we have from January 1, 1880, to June 30, 1881, manufactured and sold nearly 2,000,000 volumes of standard books, for which we have received the considerable sum of $709,521.22.

6th—In a circular issued in January of the present year we made the following statement:—"The public have so long been taught to believe books to be expensive luxuries and low prices impossible, that incredulity has from the first been the greatest obstacle to the progress of the Literary Revolution. It was easier to make good books cheap than it was to make people believe it could be done. We could readily have made prices even lower than they have been, but for the terrible tax we have been compelled to pay to this incredulity."

We have during this period from January 1, 1880, to June 30, 1881, paid for advertising the large sum of $140,878.93. This immense item necessarily has to come *out of the profits we make on the books sold.*

7th—Although our scheme originally embodied the principle of selling direct to the consumer, and doing away with the exorbitant cost of middlemen, we have not undertaken to put aside the book seller and the book agent altogether, because a large portion of the book buyers of the country have got into the habit of looking to them for their supplies, and if we were to supply the wants of such customers at all, we were compelled to do it through these ordinary channels. But we have endeavored to induce or compel these middlemen to work, as we have been doing, on a more reasonably small percentage of profit (the immensely increased sales at the reduced prices, even with the smaller commissions, really give the book sellers larger net profits than they formerly had). Accordingly we have during this period, from January 1, 1880, to June 30, 1881, allowed to the book sellers and book agents commissions averaging about 25 per cent. of our total receipts. In other words, in addition to the $709,521.31 we have received from the public for our books, the public has also paid to the middlemen the large sum of $177,380.73 simply for handling these books, making the total cost of the books to the consumer $886,901.65.

8th—From these statements you can readily see that if

From the total amount which the public has paid for our books, . .		$886,901 65
We deduct the amount we have paid for advertising these books, .	$140,878 93	
And the amount paid to middlemen for handling the books, . . .	177,380 33	
We have a total deduction of		318,259 26
And a remainder of		$568,642 39

Thus it is evident that if the public had bought these books *directly from us*, the unnecessary expense of advertising and of paying middlemen for handling them, being avoided, the books would have cost them only $568,642.39; being almost 36 per cent. less than the $886,901.65 which they paid for them, and our net proceeds would have been none the less.

A Better Illustration.

The above figures show clearly the possibility of a great reduction from our prices as heretofore given without diminishing our net income, but they do not necessarily show that it is possible for us to manufacture and sell books at such low prices *without loss to us.* As we have never made pretense of publishing books from charitable or philanthropic motives, and do not wish our friends to think we are doing business at a loss, we will give a conclusive and interesting illustration of how we can afford these low prices.

Library of Universal Knowledge.

After a labor of nearly two years by an able corps of American editors and writers, for whose services we have paid nearly $30,000, we have within the brief period of less than ten months made electrotype plates for the Library of Universal Knowledge at a further cost of nearly $30,000, making a total investment on this work of about $60,000. This labor all being done and paid for, the 15 large octavo volumes, making the largest Cyclopædia ever published in this country, can be manufactured at a cost per set of 15 volumes of—

For paper, ...	$2.52
For printing	.96
For binding	2.48
Total	$5.96

These electrotype plates which we have manufactured will readily print 100,000 copies, and then by slight repairing will print from 50,000 to 100,000 additional copies, but to make our estimate absolutely safe we will assume that it will be necessary to manufacture a new set of electrotype plates after 60,000 copies have been printed. Thus we must add to the above cost of the manufacture of one set of the books ($5.96) an additional $1 as the proportionate cost of the plates for each set of 15 volumes. A further item must also be added to cover office expenses, handling, shipping, etc., which experience leads us to estimate below 50 cents per set, but as we must do at least a *safe* business, we will add, instead, for this item another $1, making the total cost of manufacture and handling the 15 volumes of the Library of Universal Knowledge $7.96.

Thus you see that if we sell a copy of this great Encyclopædia even at the net price of $10, we still have a net profit of over $2. As we have already sold about 15,000 sets in advance of completion, we think it very safe to estimate (and we have heard of neither friend nor enemy who makes an estimate lower) that we shall sell, as fast as we can manufacture them, at least 100,000 sets, and allowing our figures above given to be correct, we have the comfortable sum of $200,000 to cover contingencies, and dividends to our stockholders.

As some of our friends may question whether our estimates above given are perfectly safe, and as we have heard of some instances where the accuracy of figures previously given by us have been disputed by our enemies, we will say that the cost of the paper is put at 8 cents per pound, the cost of press work at $1.20 per thousand impressions, and the cost of binding at 16½ cents per volume.

The Practical Point.

We now come to the practical point in which *you* are interested—how *you* may get the books you want at the lowest possible cost.

It is evident that it can only be done by *your* doing away, *so far as you are concerned*, with our immense expenses for advertising, and with the commissions which we or you are compelled to pay the middlemen; if you buy through the middlemen.

Another extremely important point in enabling us to afford the lowest possible price is that we receive *quick* returns for the investments we have made.

You readily see that we have invested about $60,000, cash, before we are able to offer you a *complete* set of the Library of Universal Knowledge at any price. We must sell a great many thousand sets before we can even get back the money which we have invested, to say nothing of the reward which we *must* have, in some measure, for our labor and the capital of the stockholders involved.

A large portion of the public still persist in getting their supplies of books through the middlemen (who must be paid for their services) instead of from us direct; and as a large expenditure for advertising will also continue to be necessary, in finding out new customers, we must continue to hold to our present retail prices, in order that we may be able to pay these enormous expenses for advertising and for commissions to middlemen.

But because we are thus compelled to tax book buyers generally with these heavy expenses, there is no occasion why we should continue this heavy tax upon *you individually* if you choose to unite with us in avoiding it.

Our Proposition to You.

We therefore make you this proposition; If you will send your order for the Library of Universal Knowledge (either for yourself or for any number of friends and acquaintances), so that we shall *receive* the same on or before the first day of September, 1881. We will accept such orders at a *discount of one-third from our published list prices*, making *net* prices to you as follows.

Library of Universal Knowledge.

For the 15 vols in cloth, net.	$10 00
In half Russia, sprinkled edges.	13 33
In half Russia, gilt top.	15 00
In full library sheep, marbled edges.	16 66

Orders sent to us under this offer will be accepted and filled by us under the following terms and conditions;

Conditions.

1st—We do not in this case, as has commonly been our custom, require that remittances shall accompany the orders. Payments may be made at any time that may suit the convenience of the purchaser, on or before the delivery of the books to him, and not later than January 1, 1882.

2d—But in making deliveries, of the books we shall give precedence to orders which are accompanied by remittance in full payment, shipping first those for which payment is first received.

3rd—After filling all orders which have been fully paid for at time of order, we shall in shipping give precedence to orders which are accompanied by a payment of 10 per cent or more on account of said order, the balance then due to be paid on or before delivery of the books.

4th—Thereafter shipments will be made to those who have sent no payment with the order, precedence being given to those whose orders are first received by us, payment of course being required on or before delivery of the goods.

5th—We shall not consider orders unaccompanied by the remittance as *binding* upon the person making it, if from any cause he is unable to take the books, or shall not then desire to do so; but in case payment is not made promptly when such person is notified that his books are ready for delivery, he will first forfeit his position on our delivery list, his name being transferred to the end, and in case payment is not made promptly when his name is again reached and he is notified, he will then forfeit the privilege of purchase at less than our full list prices, and no order will thereafter be accepted from him under any similar special offer which we may in the future make on other of our publications, unless the same is accompanied by payment.

About our other Publications.

As the present stock of our miscellaneous publications is now comparatively limited, and as our entire manufacturing resources will in all probability be for months to come taxed to the utmost by the manufacture of the Library of Universal Knowledge alone, we cannot undertake to make an offer similar to the above upon the books covered by our miscellaneous list, except to the extent of our stock in hand. Until our supply is exhausted we will accept *in connection with an order for the Cyclopædia, under the above offer*, orders for any of our miscellaneous books at the same rate of discount (one-third) from our list prices, but in all cases we shall require that orders for miscellaneous books shall be accompanied by the cash, as these books can be delivered at once and cash orders will certainly soon exhaust our supply.

Any remittances received for miscellaneous books, the supply of which may by that time have been exhausted, will either be returned promptly, or the amount will be applied toward the payment for Library of Universal Knowledge, as may be directed.

Very Important.

In connection with the special terms given above, please note particularly the following points;—

1st—We look to *you direct* for your order, and we also ask you to assist in spreading the knowledge of the existence, character, and low prices of our publications. The larger our sales, and the more promptly they are made, the more rapidly can we go forward manufacturing other equally good books, at equally low prices. We will gladly furnish you any reasonable quantity of catalogues and circulars for distribution.

2nd—The terms herewith given are limited strictly to orders which shall be received by us on or before September 1, 1881. Orders received after that date must positively come under our usual list prices or terms to clubs, which latter are limited to 10 per cent., or, at the utmost, 15 per cent. discount from our list prices.

3rd—We are well aware of the fact that very many book-buyers have not at a moment's command even $10 which they can invest, however great the inducements. This offer gives you the privilege of making payment *when it suits your convenience*, at any time before January 1, 1882.

4th—The Library of Universal Knowledge was completed on July 15, 1881, and we are now delivering the same in the various styles of binding advertised.

Library of Universal Knowledge.

Large Type Edition.

This is a verbatim reprint of the last (1880) London edition of Chambers's Encyclopædia, with copious additions (about 15,000 topics) by American editors, the whole combined under one alphabetical arrangement, with such illustrations as are necessary to elucidate the text. It gives an amount of matter about 10 per cent. more than Appleton's Cyclopædia (price, in cloth, $80 00) and 20 per cent. more than Johnson's Cyclopædia (price $51.00, in cloth). For the general reader it is undoubtedly the best Encyclopædia ever published, whatever the price. Price for the set of 15 volumes, in extra cloth, $15.00; in half Russia, sprinkled edges, $20.00; in half Russia, gilt top, $22.50; in half Turkey morocco, marbled edges, laced boards, raised bands, extra strong, $33.00. Publication completed in July, 1881, and now being delivered to purchasers. See reduced rates, given above, during August. Specimen pages and full particulars will be sent free on application.

Views of the Press.

It is the crown of the cheap and solid literature movement of the day. The original Chambers's is valuable, and for reference better than the more ponderous and diffuse Brittanica. This edition is greatly enhanced in value by the addition of 15,000 articles by American editors.—*Presbyterian Journal*, Philadelphia, Penn.

A reference to the more important articles supplied by the American editors shows that they have done their work well. The work is a marvel of compression and of cheapness, and well deserves the title it bears.—*New York Herald.*

We recommend it upon its own merits. We know that for ninety-nine out of every hundred of our readers this is the best work of the kind they can buy.—*Church Advocate*, Harrisburg, Penn.

The fullness, the variety and accuracy of the information given on American topics is at once the most distinctive and the most commendatory feature of the work.—*North American*, Philadelphia.

The "Library of Universal Knowledge" seems to meet the popular need. The additions by the American editors supply just what was required to adapt the old standard Encyclopedia to the wants of American families.—*The Advance*, Chicago, Ill.

Contains much matter that has never before made its appearance in any Encyclopædia, and is especially full and satisfactory upon American topics. These additions will make Chambers's perhaps the most valuable of all the Cyclopædias.—*Herald*, Columbus, Ohio.

It is a work of immense value, a companion that answers every question and asks none, and it is an exceedingly interesting work for general reading as well as for reference.—*The Courant*, Hartford.

Foremost among the contributions of our time to the poor man's library.—*Christian Cynosure*, Chicago.

The publication of this work was a grand undertaking, which is being carried out in a most creditable manner.—*Morning Herald*, Rochester, N. Y.

The character of Chambers's Encyclopædia is too well known to need commendation, and the American additions very greatly enhance its value. It is a marvel of cheapness, a whole library in itself. It is no humbug, but all that it claims to be.—*Methodist Recorder*, Pittsburg, Penn.

Varied and valuable is the material which the American editors have added.—*Journal*, Boston, Mass.

One of the most comprehensive Encyclopædias extant. The volumes make a handsome and desirable library in themselves, a library, too, that comes within the reach of a very moderate purse.—*Interior*, Chicago, Ill.

Their low price and their comprehensive and scholarly value will render them widely popular.—*Congregationalist*, Boston, Mass.

It stands almost unique in literature, and justifies in the infinity of the matters treated its claim to really represent universal knowledge. Ten years ago this work, though in a vastly inferior form, could not have been purchased under $50.—*Times*, Brooklyn, N. Y.

The American Book Exchange is rendering the reading public an important service.—*Evening Journal.*

AMERICAN BOOK EXCHANGE,

JOHN B. ALDEN, MANAGER. 764 Broadway, New York.

News of the Week.

ROME NEWS.

MONDAY, August 15, 1881.

The latest reports this morning concerning the President's condition denote no material change. The physicians are hopeful of his recovery, but Dr. Agnew is somewhat reticent. It is said that another operation will be performed to allow the escape of the pus which is continually gathering in the wound. It was thought during the week that he was doing much better as he was able to write a short letter to his mother at Mentor, but later the indications are that his condition is yet very critical.

LATEST.—Telegrams of this morning (16th) state that the President spent a poor night, and his temperature is higher this morning with continued nausea and vomiting.

The main Centennial Exhibition building was sold at the Philadelphia Exchange on the 9th, to Mr. W. C. Bullitt, attorney at law, for the sum of $97,000. It was rumored that the real purchaser was the Pennsylvania Railroad Company. The building originally cost $1,600,000. In its construction 75,000,000 feet of lumber and 8,500,000 feet of iron were consumed. The structure was 1,830 feet long and 464 feet wide. It was sold clear of encumbrance, the mortgage to be paid out of the purchase money.

The first party of Chinese students connected with the Educational Commission in this country left for home on the 8th, going by the way of San Francisco. The party numbers about 20; other parties will soon follow.

The official returns from 73 counties in North Carolina give 9,000 majority against prohibition. Haywood gives the Prohibitionists 21 majority. So far it stands alone.

Edgar M. Johnson, the Democratic nominee for Lieutenant-Governor of Ohio, is a devout Hebrew.

A vein of silver two feet wide has been discovered at Moretown, Vermont, on the top of a mountain. The ore has been assayed in Boston and found to be worth $5,000 per ton. The owner of the land has refused $18,000 for the claim.

A party of nearly a thousand Mormon immigrants arrived in Utah a few days since. They were foreigners, and described as having no appearance of intelligence among the men nor comeliness among the women.

Mrs. Millard Fillmore, widow of President Fillmore, died at Buffalo on the 11th,

Eighty thousand acres of Arkansas land have been bought by the Catholic Colonization Society. The aim is to induce Irishmen to become farmers.

Eight New York ladies, whose husbands are estimated to be worth $300,000,000, aggregate, dined together the other day at one of the Saratoga hotels.

Mr. William H. Vanderbilt offers to defray two-thirds of the cost of suitable buildings for a female college at Nashville, Tenn., provided the trustees of Vanderbilt University contribute the remainder. The cost of the undertaking is estimated at $50,000, and the Rev. George Price is named as the probable head of the institution, when completed.

To the Mrs. Garfield fund Bostonians have subscribed $125, against $117,500 subscribed in New York, $12 000 in Philadelphia, $11,500 in Chicago and $5 200 in Washington.

Judge Cooley, of Michigan, is prominently mentioned for the vacant place on the Supreme Court bench, to succeed Justice Clifford. He is very favorably known to the profession as a jurist and and a law writer. Ex-Attorney-General Devens and Chief Justice Gray, of Massachusetts, are also spoken of.

The convention of the American Bankers' Association opened at Niagara Falls Wednesday with a good attendance,

A Washington dispatch says the essence of the verdict in the Whittaker case will be the finding of Whittaker guilty of committing the alleged outrage on himself. This verdict will be unanimous and coupled with the unanimous recommendation that he be dismissed from the service.

The boat race between the Cornell University crew and the Vienna crew was won by the latter. The Cornells haven't won a race.

The English pedestrian, William Gale, who undertook to walk 6 000 quarter miles in as many consecutive ten minutes, in New York, finished his task Tuesday night at 6:40, and continued on the track until he added 14 additional quarters to his wonderful record.

The most destructive flood ever known to have occurred in the northern gold mining country took place in Gilpin and Clear Creek counties, Colorado, on Monday, the 8th inst. The damage resulting was confined to the town of Central, Blackhawk Idaho Springs. The first indications of the storm were visible from Central about two o'clock in the afternoon, when dark threatening clouds began to increase over James' Peak and the surrounding mountains and the roll of heavy thunder swept over the city. Soon the clouds burst and the village streets were flooded to the depth of four to five feet. The damage at Blackhawk and Central is over $100,000. Some lives were lost.

Judge Colt, of Pittsfield, Mass., shot himself through the head with a pistol on Tuesday night. He was appointed to the Supreme Bench in 1875.

Matthew Vassar, nephew of the founder of Vassar College, Poughkeepsie, N. Y., died in that city on the 10th inst., aged seventy-two years. His wealth was estimated at over $1,000,000.

Ex-Senator Browning, of Quincy, Ill., died on Wednesday night, aged seventy-six.

"Maud S." reduced her time to 2:10¼, on Wednesday last at Rochester, N. Y. She performed the feat with the greatest ease, and her driver says she can do still better. Mr. Vanderbilt, her owner, expects her to make 2:09 this season. She will trot next at Hartford, Conn., when she will be driven with a view to securing her owners desired record.

Paterson, N. J. is a circus afflicted city. It is estimated that in the stoppage of mills and loss of time whenever one of these tented excrescences puts in an appearance the manufacturing interest suffers to the extent of at least $50,000.

Ten dollars fare from Boston to Kansas City! For some days it has been possible to buy a passage from Boston to Chicago by way of the Grand Trunk Railway for five dollars, and on Tuesday announcement was made that the Chicago & Alton Railroad would accept five dollars for passage from Chicago to Kansas City on the western boundary of Missouri—half way across the continent.

A secret meeting of Irishmen who believe in fighting England with dynamite, has been held in Chicago. The members are reported well organized, with $100,000 in their treasury.

The government realized the sum of $658,209 by the sale of postage stamps in the cities of Boston, New York, Chicago, Philadelphia and St. Louis during the month of July.

Ex-President Hayes, Secretary Blaine and ex-Senator Conkling have, it is said, promised to visit the Atlanta exposition. Dates have, of course, been carefully arranged so there will be no clashing.

The population of this country increases in compactness. The cities grow more rapidly than country towns. At the beginning of the century one seventy-fifth of the population of the United States was in the cities; the present proportion is one-fifth.

Elder James White, founder of the Seventh Day Adventists, and president of the publishing association and college, located at Battle Creek, Mich., died Saturday, aged 60. He was a direct descendant of Peregrine White, the first child born in the Pilgrim father's colony.

A Connecticut patriot has tendered to President Garfield the use of a magnificent mansion, on the dividing line between Newport and Middletown, for as long or as short a period as he may desire. It commands lovely views and is, besides, a historic spot, for there earthworks were thrown up during the revolution and engagements fought between the British and American troops.

An old historical document has been found by a clergyman in Morris county, New Jersey, containing an account of an attempted assassination of Gen. Washington, in the summer of 1776, in which a member of his life guard was implicated. The guard was hung for it on the 28th of June, 1776.

The Legislature of Georgia proposes to deal with the Mormon propaganda in that State without gloves. A bill has been introduced and will pass the Legislature which provides that any person convicted of teaching Mormon principles, or endeavoring to decoy emigrants to Utah, shall be fined not exceeding $1,000 nor imprisoned not more than one year or both, in the discretion of the court.

The expected report of the sub-committee of the World's Fair at Boston, will be submitted to the full committee in September. It is said that among its recommendation will be that the Fair be held in Boston four years hence, that $6,000,000 be secured as a guarantee fund, and that the Back Bay site originally proposed, be the place selected for its location.

The silk industry in this country has prospered and grown with remarkable rapidity under the fostering care of a protective tariff. The silk mills number 77. The number of firms engaged in the manufacture of silk and silk machinery is 102. The number of hands employed is upwards of 13,000. The capital invested is over $10,000,000; more than $4,000,000 are expended in wages, and the value of the yearly product exceeds $12,000,000.

The Atlantic Fleming Mills at St. Louis were struck by lightning and destroyed on the 12th inst. The flames spread rapidly to the Oil Works which were damaged to the extent of about $45,000.

Lafayette, a city in Indiana, having a population of 14,000, supports 14 different regular publications; Akron, Ohio, a town of about 18,000 inhabitants, has seven newspapers, and Erie, Pa, a city having a population of 28,346, has seventeen newspapers—ten weeklies, three dailies (one German), three Sunday morning and one monthly.

Denver, Colorado, has a population of less than 50,000, but it includes six men who are worth from $1,000,000 to $5,000,000 each, twenty who are worth $500,000, and two hundred who represent $250,000 in their own right. Denver has, b sides its batch of rich men, six widows whose combined fortunes aggregate $3,000,000.

An enormous cannon, called the Lyman Haskin Accelerating or Multicharge Gun, is to be made at the Scott Foundry of the Reading (Pa) Iron Works. It is to be 25 feet long and have a bore six inches in diameter. The gun will be expected to throw a 150 pound shot ten or twelve miles and penetrate through two feet of solid wrought iron.

Geo. W. Tabb, a former citizen of Jefferson County, West Virginia, and foreman of the jury that convicted John Brown, in consequence of which his family had been greatly persecuted during the war, died at Harrisonburg, Va, recently.

Mr. W. H. Vanderbilt's Government bonds are now estimated to be worth $60,000,000.

A dying thief was compassionately released from the Rhode Island State Prison, and sent to pass his remaining days at home in Providence; but before his death he crawled out and robbed seven houses.

Statistics of the postal operation during the last quarter of the fiscal year just ended, compared with the corresponding period of the preceding year, are interesting and encouraging. At four of the principle offices in the country, the receipts in these periods were:—

	June 30, 1881.	June 30, 1880	Increase.
New York	$757,058 43	$636,416 50	$120,641 93
Boston	254 255 66	211 292 06	43.063 60
Baltimore	88 506 09	80,094 84	18.412 05
Chicago	305,091 18	245,251 59	59,839 50

People should avoid, as far as possible, being run over by railroad cars. An empty platform car weighs 18,000 pounds; an empty box car, 20,000 pounds; a passenger car, 36,000 pounds, and sometimes more; and an average locomotive, 80,000 pounds. A single pair of car wheels weighs 500 pounds.

The tide of immigration is still setting in strongly. The total number of immigrants landed at this port last month was 34,835. During the month of July, 1880, 25,382 were landed, showing an increase of 9,453 for the last month as compared with the corresponding month last year. The total immigration for the past seven months was 276,738, and for the corresponding period last year 202,367, showing an increase of 74,271 in 1881.

The school fund of Texas will at no distant day be enormous. That State has yet unsold 40,000,000 acres of school land, which will probably bring her public school fund to $100,000,000, a sum equal to the combined school funds of all the other States of the Union. The University of Texas, soon to be established, has more than $500,000 with which to erect buildings, and a permanent endowment of between $2,000,000 and $3,000,000.

Arresting Disease.

What we would particularly impress upon invalids and their friends, *is the value of Compound Oxygen in arresting disease in its early stages and before chronic conditions have been established.* It must be evident to the common sense of every one, that an agent which acts so potently in breaking the force of diseases which have been at work upon the system and have been exhausting it for years, can scarcely fail to arrest like diseases in their beginning, and when the vitality of the body has not been wasted. If, therefore, you have the early symptoms of Consumption, Catarrh, Bronchitis, Neuralgia or the indications of any other disease which may keep its hold upon you until it becomes chronic, *do not neglect the warning indications.* Meet the enemy upon the very threshold, and while your vitality is yet unimpaired. If your regular physician fails to reach the case, then we offer you, in Compound Oxygen, an almost certain means of restoration—the way back to health—*the agent that may save you from a life of invalidism, or from premature death.* Our Treatise on Compound Oxygen, with large reports of cases and full information, *sent free.* Drs. STARKEY & PALEN, 1109 and 1111 Girard St., Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

COMPLAINTS are made all over the West, particularly in Kansas, Nebraska and Iowa, that wire fences attract lightning, which often results in the killing of stock. The stock imagine that the fence affords protection from the storm and accordingly huddle close up to it. One instance is given where 65 head of sheep were killed in Nebraska at a single stroke, and another where 10 head of cattle were killed.....Connecticut was famous for its fine peach orchards 30 years or more ago, but for twenty years the trees have failed to bear. It is now said that the trees are fast improving, and the State may again boast of fine orchards and perfect fruit. This year's apple crop will be small, but the pear crop large.... ...The Cincinnati Price Current says reports received by Secretary Chamberlain that of the Ohio State Board of Agriculture, after thrashing, indicate that the yield of wheat in the State will average 13 bushels per acre, which will aggregate about 70 cent of last year's crop. The crop last year, according to the State report, was, in round numbers, 52,000,000 bushels, and consequently the crop this year will be about 39,400,000 bushels. Even this is more than the National report gave the State credit for last year.....One of our southern exchanges says that Louis Kent, a colored man of Mississippi, has had the honor, for three years past, of sending the first bale of cotton to market.....Switzerland has always been considered as an eminent cattle breeding country, but the consumption exceeds the production. The Custom House returns show that there are every year about 80,000 head more cattle imported than exported. Corned beef, hams and pork of the United States largely contribute to the market.....The San Francisco Journal of Commerce, after patient investigation, puts the acreage of wheat in California this year at 2,908,000 acres and they yield 27,182,000 centals, which is equivalent to 45,300 000 bushels, or nearly 20.4 per cent less than last year. The surplus for shipment will be 1,000,000 tons or 33,300,000 bushels. According to the official report issued August 4, the total acreage of wheat for 1880 in Minnesota is 2,960,073 acres, and for 1881, 2,960,678 acres, showing an increase of only 605 acres. The crop for 1880 is reported to be 39,371,799 bushels, which gives an average yield per acre for the State of 13.30 bushels. The average per acre for the State of the principal cereals was for 1880:—Oats, 33.49 bushels; corn 31.07; barley 23.21. The increase in acreage for 1881 is:—Oats 8.07 per cent: corn, 12 62 per cent. and barley, 71.24 per cent..... The hight of the Nile at Cairo last Friday was thirteen cubits and twenty-three kerats. At the same time last year its hight was nineteen cubits and four kerats. As the Egyptian harvest depends on the hight to which the Nile rises, the prospect for next harvest is not as good yet as that for last harvest at the corresponding date; for the Nile then did not rise quite as high as desirable. A writer in Land and Water says there are from one to two thousand English land holders in Virginia, with farms of from 100 to 1,500 acres, and that they are remarkably happy. He especially recommends Virginia for gentleman emigrants with large families. "It offers almost the only genuine country life with congenial surroundings to the expatriated gentleman."..... The Census Report on the fuel of the country states that four-fifths of the fuel is wood and one-fifth coal, with small quantities of hay, corn-stalk and corn used in some regions.

The latest reports from Mysore, India, are unfavorable. Rain is much needed, and crops are withering, prices rising, pastures failing, and the prospects decidedly gloomy. Unless rain falls within a week a large portion of the crops will be lost. There is a scarcity in vegetables. Reports from the province of Coorg also give a bad account. The reports from other parts of India are fairly good..... The agricultural commission of the Ontario government reports four hundred and seventy cheese factories in the thirty-six counties of the province .....The English Jockey Club has bought for $900,000 a fine estate near Newmarket. It includes 2,500 acres, with a fine mansion.....An Ohio farmerine owed a man $320. To wipe out the debt she married him, and then for $60 she got a divorce, thus saving $260..... At a meeting of the New Orleans Sanitary Association on the 11th, Dr. C. B. White reported that 2 484 hogs had been examined by the microscope at the slaughter-house, and six hogs infected with trichinæ were found, all of which came by rail from St. Louis.....Vennor says: "We may expect a great change in the weather about the time the new comet is at its perihelion, when it will be also nearest the earth. During the week from the 15th to the 20th, instead of being burned up, we shall be nearly frozen by frosts and strong cold northerly winds."

An important sale of Missouri lands was effected in this city on this day week, by Messrs. Donnell, Lawson & Simpson, bankers. The lands sold form part of a tract of the Agricultural College lands apportioned to the State of Missouri under the act of Congress of July 2, 1862, donating public lands for the benefit of colleges of agriculture and mechanic arts. They were ceded by the State to the University of the State of Missouri, at Columbia, and they are sold for the account of that institution. Mr. Geo. H. Nettleton, President of the Fort Scott, Southeastern and Memphis Railroad, purchases 115,301 acres of the lands situated in Douglass, Howell, Oregon, Ozark and Texas Counties for the average price of $2.50 an acre. The lands are divided up as follows:—Howell County, 53,128 acres, sold for $1.50 an acre; Oregon County, 8,613 acres, sold for $1.50 an acre; Ozark County, 4,406 acres, sold for $5 an acre; Texas County, 9 345 acres, sold for $3.50 an acre; Douglass County, 48,807 acres, sold for $1.50 an acre. The railroad company will probably extend its tracks through the lands, which are both agricultural and mineral, to increase their value.....The Secretary of the Kansas State Board of Agriculture reports the acreage of Winter wheat at 1,974,693, and the product at 23,154,399 bushels. The acreage of Spring wheat is reported at 208,179—a decrease of 20,318 acres compared with last year. The acreage of corn is reported at 4,171,554, against 3,554,396 last year. The quantity of old corn on hand is estimated at 18,539,000 bushels, against 19,111,000 bushels at this time last year. The acreages of oats and barley are smaller than last year. The decrease in acreage is mostly in wheat, while there is a marked increase in corn and grasses. The acreage in cotton is 135,200, an increase of 51,366 acres. There is also a large increase in flax and hemp.

Gould is gathering himself about St. Louis like an octopus. He owns its railroad connections, its bridge, its largest iron works, its barge line down the river, and he has just bought a controlling interest in the stock-yards which serve its railroads. .....Ground was recently broken for important additions to the botanical department of Cornell University, Ithaca, N. Y., consisting of—1. A large addition to the present laboratory, the whole to be used exclusively by specially advanced students. —2. A new laboratory for general students.—3. A range of five plant houses. With these improvements Prof. Prentiss will be able to make better a department already very efficient.....At a meeting of Professors of Agricultural Colleges recently held at Lansing, Mich., a committee consisting of Profs. Knapp, Shelton and Beal was appointed to make reports on experiments tried at the Agricultural Colleges. The following are some of the subjects that are to be reported upon: "Propagation of Swine," "Testing the Vitality of Different Breeds of Swine," "Testing New Varieties of Wheat," "Breeding of Corn," "From What Sources do Plants get their Supply of Nitrogen?".....The Arkansas valley in Kansas bids fair to become noted for the production of sorghum, sirup and sugar. Several new factories of considerable size are now in process of construction, and the growing crop is reported in excellent condition.....Angus cattle are bringing higher prices now in Scotland than Short Horns. At a late sale a cow brought 225 guineas, or $1,125, and others, with bulls, from 42 to 180 guineas. The average price obtained for 15 cows was $273..... ....The shipments of strawberries from Southern Illinois the past season was estimated at about 3,845,000 quarts, equal to about 160,220 cases of twenty-four quarts each. It would require about 350 cars, allowing 350 cases to the car, to ship these berries to the market.....Four years ago thirty-two acres of rugged hill-top a few miles back of Oakland, Cal., being unfit for cultivation, was planted to that quick growing semi tropical tree, the Eucalyptus globulus, 680 to the acre, and it is said that this tract with its valuable crop, would now command $6,000.

A Remarkable Revolution.

The success of the Literary Revolution in producing a Cyclopædia, the largest ever published in this country, in large type, well printed and bound, at the nominal cost of $15, seemed to the majority of book-buyers so remarkable, that the *second* Literary Revolution, which reduces the cost of this most excellent work to $10, seems almost incredible. The facts of the case are, however, made so evident and so reasonable, that there can be no questioning them. We have in this office some of the volumes which demonstrate their superior character in every way, and the facts and figures which are published in detail in an article

elsewhere in this paper, under the title of "A Second Literary Revolution," show very clearly, though very surprisingly, how it is possible to make such an extremely valuable and costly Cyclopædia accessible to the masses at such trifling cost.

To remove any possible incredulity which might exist in the minds of some that this is only a plausible scheme for getting a large amount of money in small sums from a great many individuals, in return for books which might never be delivered, the publishers do not *require* any payment whatever in advance. You may, if you please, simply send your order by postal card, and make no payment except upon delivery of the goods themselves, and after you have examined them and found them satisfactory. Orders should be sent to the publishers at once, in order to secure the special terms given during the month of August.

"My Tormented Back,"

is the exclamation of more than one poor hard-working man and woman; do you know why it aches? It is because your kidneys are over-tasked and need strengthening, and your system needs to be cleansed of bad humors. You need Kidney-Wort.—Democrat.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

Lydia E. Pinkham's Vegetable Compound has done thousands of women more good than the medicines of many doctors It is a positive cure for all female complaints. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

Lazy and dull feelings are sure precursors of sickness, which nothing but Hop Bitters will banish.

BURNETT'S COCOAINE.

The Best and Cheapest Hair Dressing.

It kills dandruff, allays irritation, and promotes a vigorous growth of the Hair.

Burnett's Flavoring Extracts are invariably acknowledged the purest and best.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, August 13.

Chicago.—Flour quiet but steady. Wheat strong and higher No. 2 Red Winter, $1.28; No. 2 Chicago Spring, $1.28, cash and August; $1.19½@$1.19⅝, September; $1.19½@19¾, October; $1.17⅛@1.17⅜, all the year; sales at $1.27½@1.28, August; $1.18⅛@1.19⅛, September; $1.18@1.19⅛, October; No. 3 do., $1.05@1.11; Rejected unchanged. Corn unsettled, but generally lower, 56¾c., cash and August; 57⅝c. September; 58¾c. October and November; sales 56⅞@58¾c, September; Rejected, 56¼c. Oats active and firm, and higher, at 34¼c. @34⅜c. cash; 34⅛c. August; 34¼c. September, 34⅜c. October; Rejected, 33c@34c. Rye strong and higher at 90c. Barley strong and higher at $1⅛. Pork active, firm and higher at $17.85, cash and September; 17.92½@17.95. October; $16.60, all the year. Lard strong and higher at $11.50@11.55 cash $11.55, September; $11.60@11.62½, October. Bulk-meats active, firm and higher. Shoulders $6.85, Short Rib $9.50; Short Clear, $9 65. Timothy seed fairly active and a shade higher, at $2.30@2 60. In store; $2.45, August; $2.42½, September; $2.42½@2.45, October. Clover-seed firmer at $4.20@4 35. Flaxseed firmer at $1.24 for crushing; $1 23@1.24 September and October. Butter quiet and unchanged. Eggs rather slow at 14@14½c. Cheese nominally unchanged. Hogs receipts, 7,500 head; shipments, 4,100 head; market weaker except for choice; sales of mixed packing 5c, lower at $5.90@6.35.

Cincinnati.—FLOUR in good demand at full prices; Family, $6@6 25; fancy, $6 50@7. Wheat in good demand at full prices; No. 2 Red Winter, $1 31@1 33; receipts, 7 500 bushels; shipments, 6 500 bushels. CORN quiet but firm; No. 2 Mixed, 62½c. OATS quiet; No. 2 Mixed, 38@38½. RYE stronger at 95@96c. for No. 2. BARLEY—No offerings. PORK quiet, but firm, at $18 Lard quiet at $11 20. Bulk meats stronger; Shoulders, $7 25; Short Rib, $9 70. Bacon in good demand at full prices; Shoulders, 7¾c.; Clear Rib, 10¼c.; Clear Sides, 10¾. WHISKY active and firm at $1 10; combination sales of finished goods, 904 obls. on basis of $1 10. BUTTER scarce and firm; fancy Creamery, $26@27c.; choice Western Reserve, 18@20c.; choice Central Ohio, 14@16c. SUGAR steady and unchanged. Hogs steady and firm; common and light, $5@6; packing, $5 90@6 50.

St. Louis—Flour nominally unchanged. Wheat higher; No. 2 Red Fall, $1 26½, cash; $1 27½, September; $1 30¼, October; $1 32½, November; $1 33¾, December; $1 25½, all the year; No. 3 do, $1 20½; No. 4 do., $1 13½. Corn irregular and generally lower at 58¾c, cash and August; 58¾c, September; 59¼c. October; 59¾c, November; 59½c, December; 58¼c, all the year. Oats—Cash higher and options lower; 38¾c, cash; 36¾c, August; 36¼c. September; 37½c, October; 38¼c, November; 36c, all the year. Rye higher at 92¾c bid. Pork quiet; jobbing, $18.35@18.40. Bulk-meats strong and higher. Shoulders, $6 80; Clear Rib, $9 50; Clear Sides, $9 80. Bacon firm: Shoulders, $8; Clear Rib, $10 60@10 62½; Clear Sides, $11. Lard higher; nominally $11 45. Cattle dull; receipts, 600 head; shipments, 1,000 head; supply light; grass Texans range from $2 50@3 75; fair to choice fat natives, $5 20@6. SHEEP steady and unchanged; receipts, 80 head; shipments, 1,100 head; range, $3@4 50.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug. 13, 1881.

BEANS AND PEAS.—Marrow beans are quiet; no export inquiry of moment. Mediums are firm; strictly choice are scarce. Few pea beans here. White kidneys steady. Red continue in overstock. Green peas have a small sale when prime at $1.45, which is easier.

Marrow beans, prime, $2.42½@2.45; other, $2.25@2.37½; medium, prime, $2.45@2.50; other, $2.30@2.40; pea, $2.60@2 85; white kidney, $2.25@2.45; red kidney, prime, $1.55@1.60; fair to good, $1.40@1.50; black or turtle soup, $1.30@1.35.

Receipts for week, 4,084 bush.
Exports do. 276 bbls.

BUTTER.—The week has been one for the sellers and even if the new figures are not lasting ones a good deal of encouraging trade has transpired. The home trade has bought upper stock freely and have paid the stiff rates demanded without a murmur.

Creamery—Western, good to choice 26@26½c; Ohio, choice, 24@25c; do. good to prime, 24@25c.; State and Pa. good to choice, 26@27½c; State sweet cream 24@25c.; poor 22@23c; State pails and h'f tubs, choice 24c; fair to prime 21@23c.; Welsh tubs, 21@23½c.; State dairy tubs, poor to fair, 19@20c; firkins, fair to fine, 22@24c.; Western imitation creamery 17@23c.; dairy, fresh choice 20@22c.; other 14@18c.; factory, Iowa, fine June, 17@18c.; other 12@16c.

Receipts for the week 35,496 pkgs.
Exports do. 6,964 do.

CHEESE.—There is no special feature nor likely to be until warm weather is over. The market opened dull; but with light receipts sellers have managed to keep stock for accumulating heavily, and prices for both state and western factory may be called steady. Skims of all kinds dull and in buyers' favor.

State fact'y, fine, col'd, 10@10¼c. do. white, 10@10¼c; good to prime, 9½@10c; fair to good 8¼@8¾c; poor to fair 8@8¼c; Wis none; Ohio, factory, cheddar, fine 9@9½c; fair to prime 8½@8¾c, flat, fine 9c, good to prime 8¼@8½c; fair to good 7¾@8¼c; poor 6¾@7¼c; creamery part skimmed, 5@6c.; full skims, 3@3c.

Receipts for week, 56,373 boxes.
Exports for week, 44,012 boxes.
Liverpool cable, 53s.
Steam to Liverpool 30@40s.

COTTON.—The past week is regarded as the dullest of the year not only here but at all English and Southern points. There is not likely to be much excitement or interest, until new crop appears or until definite figures come from the counting ports and places.

Quotations are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas
Ordinary	8 7-16	8 11-16	8 11 16

STAINED.

Good ordinary	8 1-16	Low middling	9 15-16
Strict good ordinary	9 13-16	Middling	11⅛

August 12.05@12.07c.; September, 11 17@11.18c.; October, 10.84@10.85c.; November, 10.49@10.50c.; December, 10.19@10.50c.; January, 10.62c. February, 10 73@10.74c.; March, 10 86@10.87c.; April, 10.99@11c.; May 11.10@11.12.

DRIED FRUITS.—There is little demand, but there is a strong holding market for apples of all grades. New fruit will make some variation but the speculative interests feel safe in what they have already done. Peaches too high for business. Small fruits open well for prime new; market well cleared of old.

Apples, evaporated rings, choice 12c.; prime 11@11½c.; fair to good 10¾@11c; Southern in bbls. 4¾@5¼c.; do. in bags, 4¾@5¼c; State fine cut 6¼@6¾c.; quarters choice, 6@6¼c.; small lots 5¾@6c. Ohio and Mich. 6@6¼c.; Western, fair to choice, 5@5¾c; evaporated peaches peeled 33@36c.; N. C. do. 19@25c.; Ga. do. 17@23c.; State 17@19c.; old poor to prime 12@18c.; Penn, halves 7¼@7¾c.; unpeeled ₩ qt. 7@7¼c. Blackberries, 11@11¾c. Cherries, 20@21c. Raspberries, prime new 27@28c. Whortleberries, prime 12½c.

Receipts for the week, all kinds, 800 pkgs.
Exports dried apples, 123 pkgs.

EGGS.—Receipts for week, 6,864 bbls.; do. last week 7,809 do. The demand has improved and Western stock is turning out better. Care should be taken by shippers in packing Western to avoid suspicious lots, as it will not do to have the confidence of buyers too often shaken. Near points scarce; Canada fills most extra wants.

Near points 19@20c.; State and Pa. 17½@18½c; Canadian 17@17½c.; Western, choice, 16½@17c.; inferior lots 14@16c.

FLOUR.—Buyers for export have reappeared and as desirable brands are not plenty they close in favor of the seller. The dealing has been largely in No. 2 and superfine Minn. patents and other high grades have had a liberal movement. The trade in upper priced flour has been unusually steady this season.

No. 2, ₩ bbl., $3.40@4,00. State and Western superfine, $4 30@4 80; city mills extra, $6.25@6.50; Spring wheat do. $4.85@5.15; Spring XX and XXX, $5.25@6.75; patents, $6.00@8 00; Ohio round hoop shipping, $5.00@5.10; trade brands, $5.50@6.25; St. Louis extra, $5 10@5.50, do. double extra, $5.50@6 25; do. family, $6.40@7; South'n ext. shipping, $5.40@6. do. XX and family, $6.25@7.25. Rye superfine, $5 40@5.75. Corn-meal, Brandywine, $3.50; Western, $3.00@3.30.

Receipts for week, flour 18,200, bbls.; corn-meal do. 3,400.

Exports for week, flour, 18,190 bbls.; corn-meal do. 4,568

FRESH FRUITS.—Apples are doing well; they already seem to feel the influence of a light crop. Other fruits, when quality is fairly good, have a good dull and realize reasonable prices.

Apples, Nyack Pippin ₩ bbl. $1 75@2; Orange do. $1.25@1.50; Sweet Bough, $2@2.50; Sour do $1,25@1;50 Red Astrachan $1.75@2 50. Pears, Bartlett Sav. ₩ cr. $2@2.50. do. Va. ext. $2.50@3 south'n fair $1.50@2.25; up-river ₩ bbl. $4@4.50, Clapp's favorite sth'n $3.50@4.00; Flemish Beauty, up-river, $3@3.50; Bloodgood. $2@3 Catharine $2@3; Jargonelle $1.50@2; Bell, $2 25@2 50; Sugar Top, $1@1.50; Scooters 1@1.50. Grapes, Marina, Va. case of 18 2-lb. bxs, $6@6.50; Delaware do, $4.50@5 50; Hartford do. 3@3.50; Ives do. $2.50@3.50; Concord, do. $3.50@4 50.; Ives's seedling, N. C. ₩ lb. 5@6c. Blackberries, Wilson, Jersey ₩qt, 8@12c. Huckleberries ₩box 75c@$1. Peaches, up-river prime ₩ bskt $1.50@2; poor to fair 75c.@1.25; Jersey $1@2, Md. Troth, ₩ crate, $3@4; Crawford $4.50@5 50, North Carolina, $2.50@4.50; Ga. extra ₩ 3-to-bu. box $2.50@3.50, clings do. $1.50@1.75 fair to prime ₩ bush. cr. $3.50@5. Plums, Damso southern ₩ qt. 9@10c.; Green Gage ₩ bbl. $5.50@6; Egg $5@5.50; Lombard $4@4.50. Watermelons, Norfolk & N. C. prime ₩ 100 $15@20 Md. selected $30@25; culls $6@10; Jersey Negro-head $15@20. Nutmeg melons, Jenny Lind Jersey ₩ bbl. $2.50@3; Del. & Md. $2@2.50; Norfolk 50@1.75. Peanuts are quiet, but reports of activity at the South lend some strength to prices here; Va. hand-picked ₩ lb. 5¾@6¾c.; do. fancy, 5¾@5¾c.; do. extra prime, 6¼@6¾c.; do. good to prime, 4¾@5¼c.; shelled, 3¾@4¾c. Pecan nuts, ₩ lb, 7@9c.

GRAIN.—Wheat has assumed a more business tone since crop reports are more beyond conjecture Winter wheats especially having come into quite settled visible supply. Exporters have bought largely and speculation holds. There has been more or less fluctuation in prices but as a rule quotations close with a wholesome crispness.

Wheat, Spring $1.19@1.30; do. No. 2, $1.26@1.27½; do. No. 3, $1.18@1.20; red Winter No. 2, $1,32@1.32½; red Winter $1.29@1.35, white Western and State $1.20@1,30. Rye, 85@93c. Oats, white No. 1, —c.; white No. 2, 51¾@52c., white No. 3, 49@49¾c; mixed No. 1, 45c. do, No. 2 43c; do. No. 3 41@42c Corn, Western mixed 59@60c.; do No. 2, 60@62c.; do. yellow, 60@61c.; do. white 62@65c; Southern yellow —@—c.; do. white 65@66c.

Receipts for week, wheat, bush., 894,500.; corn, do 3,645; oats do, 659,250; rye, do. 5,190; malt, do. 93,054; rice pkgs. 689.

Exports for week, wheat, bush 1,294,349; corn, do 1,098,602; oats, do. 47,745; rice, pkgs., 1,830.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports and on rail, on lakes, on canals and on Mississippi River:

	1881. Aug. 6. bush.	1880. Aug. 8. bush.	1879. Aug. 10. bush.
Wheat	17,539,095	14,791,197	15,189,594
Corn	15,894,283	16,647,605	11,436 314
Oats	7,404,718	1,465 557	1,914,457
Barley	145,573	169,717	318,434
Rye	250,521	387,682	479,119
Total	41,214,185	33,461,758	29 337,983

HAY AND STRAW.—Exports for week 920 bales. A good many poor lots have arrived that are rejected as there is an abundance of good quality to come and prices favor trading in best qualities. Straw doing fairly.

Prime retailing timothy hay, 85@90c. ₩ 100 lbs.; medium do. 60@75c. do.; shipping grades 50@55c. do.; clover mixed 50@55c.; pure 40@45c. Straw, long rye 80@85c.; short do. 65@75c.; other grain, 35@40c.; new rye straw 65@75c.

HOPS.—There is ready sale for all the good hops offering, as the supply is known to be small. Low grades are dull. A good many lots have heated during August; these are very hard to sell. New hops not arriving in quotable quantities.

State crop of '80, choice, 20@22c; good to prime, 16@18c; fair to good, 14@16c; poor to fair, 11@14c; Eastern, 14@17c.; '77's, 12@15c.; olds, fair to prime, 5@8c.

Receipts for week, 400 bales.
Exports for week, 1 bale.

POULTRY AND GAME.—Supplies of dressed are more controlable and good stiff prices are ruling for all good stock. Turkeys when prime have a steady sale for steamer use; it is useless to send poor quality; spring ducks in demand; few in market. Chickens and fowls have had a brisk week; quality good.

Turkeys, Phila. prime ₩ lb 18@20c.; State & Western d. p. 18@19c.; scalded 16@18c. Chickens, Phila. prime 22@23c; N. J. & Bucks Co, 20@22c; State & W'l'n sp'g 18@20c. Fowls, Phila. d. p 15@16½c. Bucks Co. 15@16c; N. J. d. p. 15@16c; do. scalded 14@15c.; State and West'n d.-p. prime 14½@15½c.; do. scalded 14@14½; do. coarse 13@13½c. Ducks—Spring, Phila. ₩ lb 18@19c; J'y & Bucks Co. 17@18c. State 15@17c; old, fair to good 12@13c. Squabs, white ₩ doz. $2; do. dark, $1.50.

Cooped stock has ruled unsteady. Daily free supplies are not needed in Summer, as city killers do not as a rule count upon more than two or three busy days, and these come at the close of the week. Prices, however, average fair for a hot Summer month.

Chickens, Jersey ₩ lb 17@18c.; State 16@17c.; Western and Southern 14½@16½c. Fowls, Jersey, State and Pa. 13½@14c; western 12@13c; southern 12@12½c.; roosters, old 5@6½c.; turkeys, Jersey & Pa. 14@15c.; western 13@15c; ducks, Jersey, N. Y. and Pa. ₩ pair 65@87c; other 55@65c; geese Jersey & Pa. $1.50@1.75; other $1@1.37; pigeons, large strong birds 30@35c; young 20@25c.

Ing'me Woodcock are scarce and firm; a choice lot of State might slightly exceed our quotation No wild pigeons or squabs arriving; the last squabs here sold at $1.25 ₩ doz. English snipe and plover are not wanted at present.

Woodcock ₩ pair $1.25; wild squabs, stall-fed ₩ doz. $ .25 Eng. snipe $1.75@2, plover $1.75@2.

PROVISIONS.—Hog products continue to run in the track of speculative manipulation. A possibly reduced corn crop is a material source of help to the "bull" or high priced interest when cash or or spot goods are to treaty but with quotations at present points buyers fill only pressing requirements. In lard the tendency at the moment is for lower figures, but the material both "proper" and real stock, is so strongly concentrated in the hands of a few prominent operators that the easing up is suspected to be merely a part of speculative tactics. Light smoked meats are wanted for current use, but the supply is light as cutters cannot furnish the full demands of customers at a profit.

Pork extra prime, ₩ bbl $14@14.50; Western mess, new, $17.75@18. Lard, steam West'n ₩ 100 lbs, $11.3 ½@11.35; prime city, $11 35. Hams, smoked city ₩ lb 12@12½c; pickled Western and city 11@11¾c; Shoulders: smoked city, 8¼@8¾; pickled, 7¾; rib bellies pickled, 9½@10½. Bacon, long clear, west. 9¾@10c. Beef, wes ern mess ₩ bbl., $11@13.50. India mess tcs. $25@27.50; beef hams bbls. $21@23.

Receipts for week—Beef, bbls and tcs. 502; pork, bbls, 1,656; Cut meats, pkgs. 13,403; lard, do 6,700. Exports—Beef, bbls and tcs, 1,750; pork, 2,335; cut meats lbs. 5,079,044; lard, do. 1,159,226.

TOBACCO.—Spanish buyers have again appeared and good sales have been made for France. The Western crop of leaf is said to be badly injured by prolonged dry, hot weather, and there is an active inquiry for attractive leaf at some advance. The following rates for hhds show an advance of ¼c.—

Light and heavy common lugs 5@6¾c; good do, 6@7c; low leaf 6¾@7¾c; medium do, 7¾@9c; good do, 9@10¾c fine do, 10@12½c; select do. 12½@ 14¾c; other stock about as last reported.

VEGETABLES.—Potatoes are not arriving so freely and prices have advanced. The new prices do not check the demand for prime L. I. Sweet sell well and are of good quality. Long Island extra, bulk, ₩ bbl. $1.75@1.87. fair to good $1.37@1.62. New Jersey $1.50@1.75; Va. sweet yellow $3.75@4 red $2.75@3; Del. $1@1.50

Sweet corn, prime 60@75c; poor 30@50c wax beans L. I. $1.25@1.50; string beans L. I. $1@1.50 Lima potato $1.50@1.75; cucumbers, L. I. ₩ 100 75c@$1; egg plant L. I. ₩ doz. 75@$1 25. Phila ₩ bbl. $2@2.50 Tomatoes L. I. ₩ bu. 20@25c; squash marrow ₩ bbl. $1.50; L. I. white $1@$1 50 do. yellow, $1.25@1,50; cabbages, ₩ 100, $3@5. beets, L. I. ₩ 100 bchs $1.50@2; onions, white ₩ bbl, $2.50@3.00; yellow prime $2.50@3.50; red Eastern $2.50@3; red Chester $2@2.25; carrots ₩ 100 bchs $1@1.50, turnips Russia ₩ bbl, 75@$1; okra ₩ 100 15c.

WOOL.—There are no very free sellers. Owners who secured a good portion of the clip at early prices have parted with some stock shading from time to time until the actual late sales are 3c. off from what are still holding rates. A large stock is being carried much of it laid in at high figures. Its owners decline to sell under and seem buoyed up with the hope that a future stronger run upon the market will support their views. The demand at the moment certainly is not of a decisive character to test prices for fine lines or large useful parcels. Selling prices will be reported next week.

LIVE STOCK MARKETS.

NEW YORK, Saturday Aug. 13, 1881.

BEEVES.—Receipts for the week 12,585 head; do last week 12,398 do. Cattle sold readily at all the yards and nothing was left over. Nearly all grades of native cattle advanced 1¼c. ₩ lb. and even Texans and coarse Colorados were doing better. If supply is not large Monday's market will be good. Today's sales of Texans were at 7¾@8c, with 10 cars of Colorados at 8¼@9c. Very poor to choice native steers ranged from 8c. to dress 65 lbs. to 12c to dress 57 lbs. Bulls were dull and lower.

MILCH COWS.—Trade is quiet at $30@55 per head for the grades arriving. This market loses some of its call owing to scarce pasture in immediate grazing points and the long low rating of milk.

SHEEP AND LAMBS.—Receipts for the week 33,761 head; do. last week 37,519 do. Very common to good sheep sold at $3.62½@5.50; a deck-load of W. Va. lambs, 6¾c; 1 car of Va. 7¼c; 2 cars of Ky & Tenn. do, 5¾@6¼c; 41 head of Penn. do, 7c; and 131 at 6c; 3 cars of Canada do, $7.25@7.50 2 cars of State do, 7¾@8c; and 427 head of Jersey do, 6¾@8c.

VEAL CALVES.—Small meats have not had a brisk run and veal has had its share of dullness; only selected N. J. live brought the extreme.

Live N. J. prime to choice, 7½c; do. State, 7¼c.; poor to good 5@7c.; Mt. Hollys, 6@7½c.; buttermilk, 3¼@3¾c.; grass 2¼@2½c

SWINE.—Receipts for the week 18 838 head; do. last week 17,573 do. Prime live quoted at strong figures, States 6¾c. and prime Ohio corn-fed 7c. N. J. pork 9@9½c; city dressed 8¾@9c.

MARY AND HER LAMB.

Mary had a William goat,
And he was black as jet;
He followed Mary around all day,
And liked her—you just bet!

He went with her to school one day;
The teacher kicked him out—
It made the children grin, you know,
To have that goat about.

But though old Whack'em kicked him out,
Yet he lingered near,
He waited just outside the door
Till Whack'em did appear.

Then William ran to meet that man,
He ran his level best;
He met him just behind, you know—
Down just below the vest.

Old Whack'em turned a somersault,
The goat stood on his head,
And Mary laughed herself so sick
She had to go to bed.

FARMING FOR BOYS AND GIRLS—NO. 31

HENRY STEWART.

Fertility of the Soil.

If any product of the soil, any plant or any animal that feeds upon plants, be consumed, as by fire, or the slower process of decomposition by decay, a portion goes off, or escapes into the air and the remainder is left in the condition of earthy matter similar to fine soil. It is reasonable to suppose and believe that that portion of organic matter which escapes into the air, as it decays, comes from the air at first; and that portion which returns to soil came originally from the soil, and this is precisely the fact. Furthermore that portion which escapes into the air exists as a part of the vast store of plant food in the air just as the earthy part adds, on its return to the soil, to the stock of plant food there.

The atmospheric or gaseous portion of the substance of plants and animals, which is known as organic matter, consists of oxygen, carbon, nitrogen and hydrogen or combinations of these. The mineral or soil portions consist of phosphoric acid, potash, lime, soda, magnesia and some other substances. And that property of the soil, which we call its fertility, or in other words its power and capability of producing crops, consists of the presence in it in sufficient quantity of those substances which plants take from it.

It has long been a disputed point among scientific men if the nitrogen of plants has been derived from the soil or the air; some believing one thing and some the other. There is proof of some kind on either side, and opinions are divided upon this point. It may not be wise to decide either way, but to leave the question as one not yet settled. But it may be worth while to consider a few facts in relation to it.

First, that all the nitrogen in the soil has come from the decay of plants and animals during all the vast periods since the first plants grew and the first animals fed upon plants.

Second, that the first plants which grew could not have derived any part of their nitrogen from the soil unless it came directly to the soil or to the plant itself, from the atmosphere of which it furnishes four parts out of every five of its bulk or volume.

Third, that natural laws never change; and what was once true in regard to the life and growth of plants and animals, must be always and ever true.

Fourth, if plants at one time derived their nitrogen from the atmosphere—and it is evident that at one time this was the only source of this portion of the food necessary for plants—then it is also evident that plants always did, and do, and will continue to, derive their nitrogen from the atmosphere.

So then we may consider that the actual fertility of the soil consists of certain mineral matters above mentioned and that this natural fertility is enlarged by the addition to the soil of elements containing carbon and nitrogen. It is important that every farmer and every youth expecting to become a farmer, should understand clearly how it is that the soil is enabled to produce crops, and if there is any question connected with it that is as yet not clearly settled, this should be presented clearly to the mind, that it may be considered as well as may be possible, with the knowledge and experience that comes to us through our daily work in the fields, and through the fruits of our own thought.

INSECT TRANSFORMATIONS.

Among the interesting and wonderful things of nature is the transformation or change of the ugly-looking, sluggish worm of the clod into a beautiful insect, whose wings are painted bright with the rainbow's various hues.

In the life of an insect there are three periods, in some more distinctly marked than in others, and these periods are known as the *larval*, or time of infancy, the *pupal*, or time of rest, with most insects, and the *adult*, or time when full growth is attained. In the first period those insects which undergo complete transformations pass their time in eating and changing their skin, but they grow rapidly. There is nothing in their appearance to denote that they will ever be anything more than the ill-looking worms they then are. Indeed, they seem to live for the purpose of eating, and when they can eat no more, they die.

But not so. Let us consider—not the lilies of the field just now, but the caterpillars. On any vine, almost, we can readily find a specimen. Watch it patiently and see how fast it eats! See the great holes in the leaves, cut out as neatly as can be! It acts as if it were preparing for the long sleep it is about to take; and so it is. When the caterpillar becomes fully grown he crawls away into some concealed place, throws off his "old coat," and enters the pupal or chrysalis state.

Now he can neither move about nor eat; he simply exists. Probably nearly every one has seen the little house in which the caterpillar now lives. It is generally, though not always, a whitish oblong cocoon which, as time passes, turns to a reddish color. We may open this and on close examination we shall find that quite a change has come over our caterpillar. He was once large and long, but in this pupal state his body is much contracted. Wings, legs, antennæ or feelers are closely compressed and stuck to the body by a varnish-like substance. After a while there is a struggle within the "little house," the cocoon bursts open and from its dark and confining walls emerges the butterfly or moth. It has entered upon the last stage of its existence, it has become an adult. It is weak at first, and its wings are shriveled, but the light and air soon dry off the moisture, the limbs acquire strength and flexibility, and it spreads its wings to the sunlight, which now become the means of locomotion to carry the once ugly-looking caterpillar which fed on leaves, from flower to flower to feed on honey-juices.

The transformation is complete! The form and size of the body has been changed; eyes are there; some legs have gone, others have appeared; four wings, sometimes colored in most exquisite beauty, now adorn it, and a slender tongue sips liquid nourishment, which, alone, the stomach can digest. But its life in this stage is brief. It has passed many dark days to sport for a short time in the light. UNCLE MARK.

THE MAGNITUDE OF A MILLION.

Having noticed that few pupils in our schools have any definite idea of the magnitude of large numbers, I have taken the method described below for the purpose of elucidating the subject. Being a little surprised myself at the result of the calculation I have asked several grown persons and among them some good business men, to guess how much a million kernels of corn would measure, and have never yet known a person to guess half enough. So I have counted a quart (not the liquid quart but the thirty second part of a bushel) and found it to contain 2,176 grs., which multiplied by the number of quarts in a bushel 32 makes 69,632 grains in one bushel. Then 1,000,000 divided by 69,632 gives over fourteen bushels as the measure of one million corns. As it is pretty generally understood that figures will not lie I have recommended this method of ocular demonstrations of magnitude. S. B. P.

Muskegon, Mich.

THE YOUNG QUERIST.

E. L. P., Homer, N. Y., wishes to know what will kill myrtle.

ANS.—Spading it up frequently will do it.

S. O. F., Petersburgh, Ohio, asks what produces the "black rust" on verbenas.

ANS.—It is caused by the verbena mite, an insect closely related to the Red Spider, and which can hardly be seen without the aid of the microscope. It infests the heliotrope, petunia and other plants. No good remedy can be given for it. It is said that it does not attack strong plants, hence, stimulating them with liquid manure may prove a preventive.

J. D., Beverly, Oregon, wants a book on catching and preparing insects for the cabinet.

ANS.—There is a little book published by Lee & Shepard of Boston, Mass., which gives excellent information on this subject to beginners. It is entitled "Insects; How to Catch and Prepare Them for the Cabinet."

F. E. C., Leavenworth, Kansas, asks how his daughter can become a member of the Horticultural Club.

ANS.—By sending her name and address to "Uncle Mark," at this office.

NOTES.

A few days since, Mr. Heins of Patterson, N. J., called at the RURAL office and exhibited a very peculiarly marked and beautiful butterfly, which, I wish every one of the cousins could have seen. Viewed through a small magnifying glass the number "1881" was distinctly visible on its wings, the figures 18 being on the left wing, and 81 on the right. I am not going to attempt to account for this peculiarity, but if any of the cousins wish to try, I shall be glad to hear from them. Mr. Heins calls it the "Admiral," or Papilio atlanta, speaking entomologically. He has four specimens all marked precisely alike.

One of the cousins on the prize drawing list, who received an engraving from us, writes as follows:—

"DEAR UNCLE MARK:—Many thanks for the picture. In haste, FRANKIE BROOKS."

Madison, Wis.

Will "Amanda" please send her full name and address. We must have these from all who wish to join our Club.

It would doubtless be a good plan, for those of the Cousins who are interested in Geology, to exchange specimens and correspond with one another on the subject, as Mary Everts suggests, in her letter. UNCLE MARK.

LETTERS FROM THE COUSINS.

UNCLE MARK:—My father has taken the RURAL NEW-YORKER twenty-five years, and I have been its constant friend since old enough to look at the pictures. I've received much instruction from it, in many ways. The letters from the Cousins are interesting, coming, as they do, from all parts of our grand country. How would it please the Cousins to pay a little attention to geology, just for a change? I think among so many Cousins there must be some, like myself, interested in geology and the collecting of specimens. Perhaps we may exchange, and in this way get fine collections for our cabinets. Mr. Chadwick wrote such a nice article for Harper's Magazine last year, about Western Massachusetts and the tourmalines, garnets and other fine specimens, and I've been anxious to get some of them. Maybe some of the Cousins can help me. MARY E. EVERTS.

North East, Erie Co., Pa.

DEAR UNCLE MARK:—I have been very much pleased lately reading the Cousins' letters and thought I would write you. I think you must be very much like my Uncle Richard from the description one of the Cousins gave of you, and it makes me feel like writing to you. I have got two sisters but no brother. We have a large cat which my little sister is very fond of dressing up like a baby. He weighs about twelve pounds, and will roll over for something to eat, and catch hold of the door knob and shake it when he wants to come in. My papa takes the RURAL and thinks everything of the Tree Number, especially. My grandpa took it almost ever since it was first published until a few years past. Papa received the White Elephant in a box all right, and he expects to raise a big crop of Elephants. I would like to join your Club, if agreeable. Your would-be niece,

MARY E. HUMPHREY.

Illyria, Fayette Co., Iowa.

DEAR UNCLE MARK:—We subscribed for your paper this Spring, and have planted the seeds you sent us. They are all doing nicely, especially the potatoes, and they were planted late. There are three hills. The tops are very heavy and in bloom. I have a flower bed of my own, containing carnations, pinks, lemons, balm, and a blush rose that is in bloom. If I join the Club can I write more than once? I like your paper very much; and would like to join the club. I am 11 years of age, and have four brothers, all older than myself. I live in the country about five miles from Oconto City. Yours truly, ALICE M. COOK.

Oconto, Wis.

[We are always glad to hear from the Cousins whenever they have anything interesting to communicate.—U. M.]

DEAR UNCLE MARK:—As I have not seen many letters from the Cousins lately, I concluded to write and tell you how I got along with my Cousin correspondents. I only had one and he dropped out of sight, for after a few letters had passed I heard nothing more about him. I wish Alma Allen would write to me as I like to correspond with my relations. I thank you very much for the seeds you sent us, but am sorry to say the celery seed did not come up. I sowed some okra, portulaca and mignonette seed, but none came up; but the pinks are doing very well. I will have to close for this is on the road to the waste basket. With love to all the Cousins I remain your niece,

Wolfe Island, Ontario. FANNY HORNE.

The Puzzler.

HIDDEN HOUSE ARTICLES.

1. So Fanny has gone at last.
2. It is enough to set teeth on edge.

Sabbath Reading.

MAY BE YOUR TURN NEXT.

Judge not too harshly, oh, my friend!
Of him your fellow-man,
But draw the veil of charity
About him if you can.
He once was called an honest man,
Before sore trials vexed—
He stepped from out the narrow way;
It may be your turn next.

Fainting upon the great highway
A suffering soul doth lie;
Go staunch his wounds and quench his thirst,
Nor pass him idly by.
God will not brook the swift excuse,
The thoughtless, vain pretext;
A fellow-mortal bites the dust:
It may be your turn next.

You heard, one day, a single word
Against a person's name;
Oh, bear it not from door to door,
To further hurt his fame.
If you're the man you claim to be,
Remember, then, the text
To "Speak no evil," true or false;
It may be your turn next.

The world is bad enough, we own,
And many need more light;
Yet with true love for all may we
Help on the cause of Right.
Lift up the sinful and the weak,
The souls by care perplext,
Well knowing that to drink the gall
It may be our turn next.

CHRISTIANS IN BUSINESS.—How to be a Christian in business is a question sometimes discussed in the prayer meeting. It may be well to reflect that we are all Christians in business, if we are Christians at all; since we all sustain business relations with our neighbors. The question concerns not the commercial classes alone, but all the rest of us. The laborer, the mechanic, the teacher, the preacher, the professional man, are all exchanging their services for money or its equivalent. There is a business side to every man's life. The lady who goes shopping is a Christian in business—or ought to be The same virtues that we demand of the trader we ought ourselves to possess, truthfulness and honesty and promptness and courtesy are required of all Christians in their dealings with one another, whether they belong to the commercial class or not.—Sunday School Times.

The preciousness of little things was never more beautifully expressed than by B. F. Taylor, in the following: "Little words are the sweetest to hear. little charities fly farthest, and stay longest on the wing, little lakes are the stillest; little hearts are the fullest, and little farms are the best tilled. Little books are the most read, and little songs the most loved. And when nature would make anything especially rare and beautiful, she makes it little—little pearls, little diamonds, little dews. Everybody calls that little which he loves best on earth."

What shall I give? To the hungry give food; to the naked clothes; to the sick, some comfort; to the sad a word of consolation; to all you meet, a smile and a cheery greeting Give forgiveness to your enemies; give patience to the fretful; give love to your households; and, above all, give your hearts to God.

"Holiness carries a graceful majesty with it wheresoever or in whomsoever it is truly and sincerely possessed."

Miscellaneous.

Music Teachers

WILL NOW SELECT BOOKS FOR THE FALL CAMPAIGN,

and cannot possibly find a better book for Choirs, Conventions and Singing Classes, than L. O. EMERSON'S

HERALD OF PRAISE ($1.00), which is to be the leading book for 1881–1882

Success follows success in the successive issues of Emerson's books, and this is to be no exception to the rule. *It is in press and nearly ready.* A less expensive book will be THE IDEAL (75 cts.), made expressly for Singing Classes, and except in size, is quite as good, and on the same plan as THE HERALD OF PRAISE.

SUNDAY SCHOOL MEN

will search far and long before finding a better Sunday School Song book than THE BEACON LIGHT, (30 cts.) By TENNEY and HOFFMAN. Or LIGHT AND LIFE. (35 cents.) By R. M. McINTOSH.

School Teachers

will not fail to examine our new and superior WELCOME CHORUS. ($1.00.) By W. S. TILDEN. For High Schools. And the newest and best Common School Song Book, by L. O. EMERSON, called SONG BELLS. (50 cents.)

PERSONAL ITEMS.

Not only is the Lord Mayor of London a Methodist, but he goes to class meeting in the warmest weather.

Ex-Senator Conkling already has had three $50,000 retainers, according to the Washington Republican.

Mrs. Frances Hodgson Burnett, the novelist, is at Long Branch, where she is enjoying the sea sands between pa ragraphs.

Washington rumors have it that Senator Plumb, of Kansas, has cleared nearly $3,000,000 in mining operations in the last two years.

The baggage taken by the Crown Prince and Princess of Germany and their suite to Norris Castle, in England, weighed nearly eight tons.

"Gesticulation," says an eminent actor, "is fast becoming a lost art?" He probably never saw Talmadge fencing with an imaginary lobster.

Mrs. M. C. Steele, a sister of Senator Conkling, has been a searcher of women passengers at the New York Custom House for the last twelve years.

Sitting Bull has named one of his twins "The War is Over." "She-Who-Glances-at-You-as-She-Walks," is fourteen years old and a very nice girl.

"Boss" Shepherd's associates in Chihuahua, Mexico, write that he is rapidly rebuilding his fortune. He now has control of twenty-one mining properties, several of which are said to be yielding very rich ore.

A telegram from New Orleans on the 10th says: "Mr. and Mrs. Jefferson Davis will sail Sunday morning for Liverpool on the British steam-ship Bernard Hall, of the West India Line. They are going after their daughter, who is being educated abroad."

A correspondent of the Cincinnati Commercial says that Mrs. Lincoln, the President's widow, bids fair to reach three-score and ten years. Her trouble is in her mind. She fears that she may be reduced to want before she dies. Some time ago she pinned $3,000 in the folds of her walking-dress for safe-keeping.

Kossuth is still living at Barraccone, in Piedmont, not very far from Turin. He leads a most retired life, visits nobody and cares to see no visitors but Americans, to whom he is always "at home." In spite of his advanced years—he was born in April, 1802, and is consequently well on to eighty—he still retains largely his extraordinary powers of work.

(Indianapolis Indiana Farmer.)

Everybody Right:

When every one says a thing is so, it must be so." On this point Mr. A. H. Lyman, Druggist, Manistee, Mich., writes: Every one who tries St. Jacobs Oil, says that it is the best remedy ever used for rheumatism. Mr. White, a customer, after having employed every known specific for rheumatism was cured by St. Jacobs Oil.

PYRETHRUM

Cinerariæ Folium,

THE GREAT

CALIFORNIA

INSECT-DESTROYING PLANT.

This celebrated plant has been pronounced unequaled as to its value and efficacy by any other production ever introduced on the American continent. Its growth and general use will eventually destroy all noxious vermin which infest the dwellings and persons of men and the domestic animals, as well as the insects which create such havoc with the products of the soil and of human industry.

Among the eminent scientists who have given the Pyrethrum exhaustive and thorough examination and trial may be named Prof. C. V. Riley, Chief of the United States Entomological Commission, and Prof. S. Henry Comstock, of the Agricultural Department, Washington, D. C.; Prof. A. J. Cook, Agricultural College, Lansing, Mich., and Prof. E. W. Hilgard, State University, Berkeley, Cal., all of whom unite in declaring it superior and infinitely surer and safer than any other insecticide ever offered to the public.

On receipt of $5 we will send a package of seed by mail to any address, with instructions for cultivating the wonderful plant from which our G. N. MILCO'S BUHACH CALIFORNIA INSECT POWDER is made. Each package will furnish plants for two or three acres. All orders for seeds must be sent to the

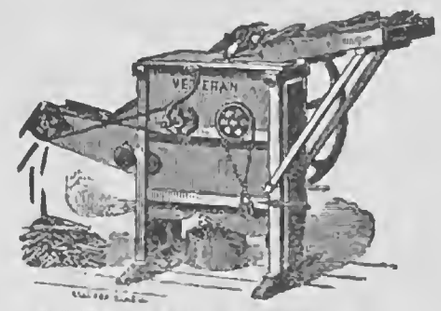
WALKER--THE BEST WASHER.

Warranted for 5 Years, and satisfaction guaranteed or money refunded. The Best, most Efficient, and most Durable Washer in the world. It has no rival, and is the only machine that will *wash perfectly clean without rubbing.* It can be used in any sized tub, or shifted from one tub to another in a moment. Is so simple and easy to operate that the most delicate lady or child 10 years old can do the work. It is made of Galvanized Iron, and is the only Washer in the world that has the Rubber Bands on the Rollers, which prevent the breaking of buttons and injury to clothes.
AGENTS WANTED Exclusive territory. Retail price $8.00. Agents' sample, $3.50, Also the celebrated Keystone Wringers at Manufacturers' lowest price. Circulars free. Refer to editor of this paper. Address ERIE WASHER CO., Erie, Pa.

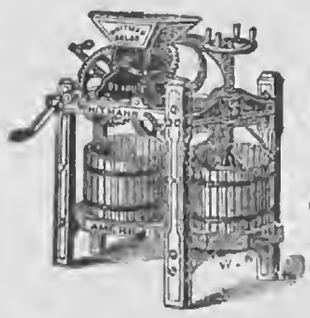
It is manifest that from GOOD SEEDS ONLY can Good Vegetables be obtained.
The character of LANDRETHS' SEEDS has been substantiated *beyond all question.*
They are the STANDARD for Quality.
Over 1500 acres in Garden Seed Crops under our own cultivation.
Ask your Storekeeper for them *in original sealed packages,* or drop us a postal card for prices and Catalogue.
Wholesale trade prices to dealers on application.
Founded 1784. **DAVID LANDRETH & SONS, 21 and 23 S. Sixth St., Philadelphia.**

Veteran Corn Sheller



FOR HAND OR POWER.
Just the thing for Mill, Farm and Plantation.
Power and Hand Corn Shellers of all sizes and to suit all wants.
HORSE POWERS, JACKS, Etc.
Write for Descriptive Circulars and prices. Address SANDWICH MANUF'G CO., Sandwich, Illinois.

AMERICUS CIDER MILL.



Whitman's Patent
The Best Cider and Wine Mill made. It will make Twenty per cent more Cider than any other.
Perfectly Adjustable.
Three Sizes.
Geared outside. Large Mills made for two cranks.
Price as low as any first-class mills.
Circulars giving full description sent free.
Address the manufacturers.
Whitman Agricultural Co.,
Saint Louis, Mo.

ENSILAGE POWER! Our 2-Horse Eureka Engine and Boiler is just the thing—Safe, Convenient, Durable.

ALL THE CHOICE NEW SORTS.
The Great Strawberry of the Future.
MANCHESTER. The most prolific, the finest, large, handsome, of great vigor and the best flavored of any productive strawberry yet produced.
"The Manchester has more good qualities than any other strawberry in cultivation."—DR. HEXAMER.
"I have never seen a strawberry that in all respects impressed me so favorably."—PETER E. MEAD.
"I regard the Manchester as a very promising variety indeed."—E. WILLIAMS.
"We shall be greatly disappointed if the Manchester does not make its mark in the future."—AM. AGRICULTURIST.
A special catalogue of this remarkable strawberry, giving opinions of the authorities more fully, notices of the press, history, etc., and a colored plate will be mailed to all applicants. A large and superior stock of both Pot Grown and Layer Plants of Bidwell, Mount Vernon, Finch's Prolific, etc. An illustrated Pamphlet free to all.
J. T. LOVETT, Little Silver, N. J.
ALL THE GOOD OLD SORTS.

BLOOMINGTON (Phœnix) NURSERY and GREENHOUSES. Established 1852. 600 *Acres.* 13 *Greenhouses.* Fruit and ornamental Trees, Shrubs, Evergreens, Grapes, Bulbs, Seedlings, Hedge Plants, Small Fruits, etc. Priced catalogue for Fall of '81 mailed free. SIDNEY TUTTLE, Agt., Bloomington, Ill.

BIDWELL, Manchester, Jersey Queen, Longfellow, and 40 other varieties of Strawberry Plants, potted or layer. Circulars free. F. I. SAGE & SON, Wethersfield, Conn.

Peach, Plum, Apple, TREES!
And a Full Assortment of Nursery Stock.
GEORGE ACHELIS, West Chester, Pa.
160 acres of good unimproved land for sale in Kansas, at $5.50 per acre.

POMONA NURSERY.

100 ACRES IN SMALL FRUITS.
Manchester, Mount Vernon, Bidwell, Banfeht and other choice Strawberries. Early Welch, Queen, Cuthbert and Turner, the best hardy Red Raspberries. Snyder, Wallace and Taylor, the hardiest and most productive Blackberries. KIEFFER'S HYBRID PEAR, handsome, large, good quality, bears young and abundantly. "40 Years Among Pears," "40 Years Among Small Fruits": either for 15 cts.; both for 25 cts. *Catalogue free.*

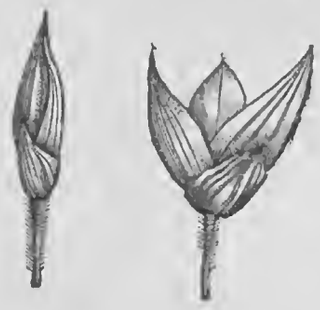
Field Crops.

OLD WITCH GRASS, HAIR GRASS.
(Panicum capillare.)

THE leaves and sheaths of this annual grass are usually covered with large numbers of bristling hairs. The culms grow from one to two and a half feet high. They are rather stout and bear broad, linear leaves. The panicle is large, pyramidal, with very slender branches which are quite spreading with age. The bases of the branches are enlarged and when mature are quite brittle and easily separated. It grows in waste places and fields where it is generally considered a weed. It varies much in appearance. In color it may be green or dark purple. The flowers appear in July and later. It does not seem to be a promising grass for lawns, meadows or pastures. Owing to its stiff hairs and coarse texture, cattle are not fond of it. The chief place where it can claim attention is in the garden of ornamental grasses. If cut when young the panicles will not easily break in pieces. They are very ornamental in suitable places. The seed is often sold under a variety of names. I obtained the grass, among many others, from the Kew Gardens under three different names. It is very easy of cultivation and, when once introduced, will not be readily exterminated. It is common on the prairies, where it is admirably provided with means for wide distribution. The panicles, when ripe, easily break off. The branches stand out



OLD WITCH GRASS—FIG. 418.

at a wide angle. The light mass is freely driven for long distances by the wind, scattering seeds on the way as the brittle branches separate from the panicle. It may sometimes be seen very lightly piled as high as the top of the fence which checks its motion, or in the tops of shrubs or even in the tops of trees, 20 or 30 feet from the ground. I have frequently seen it tumbling over the fields driven before the wind with great speed.

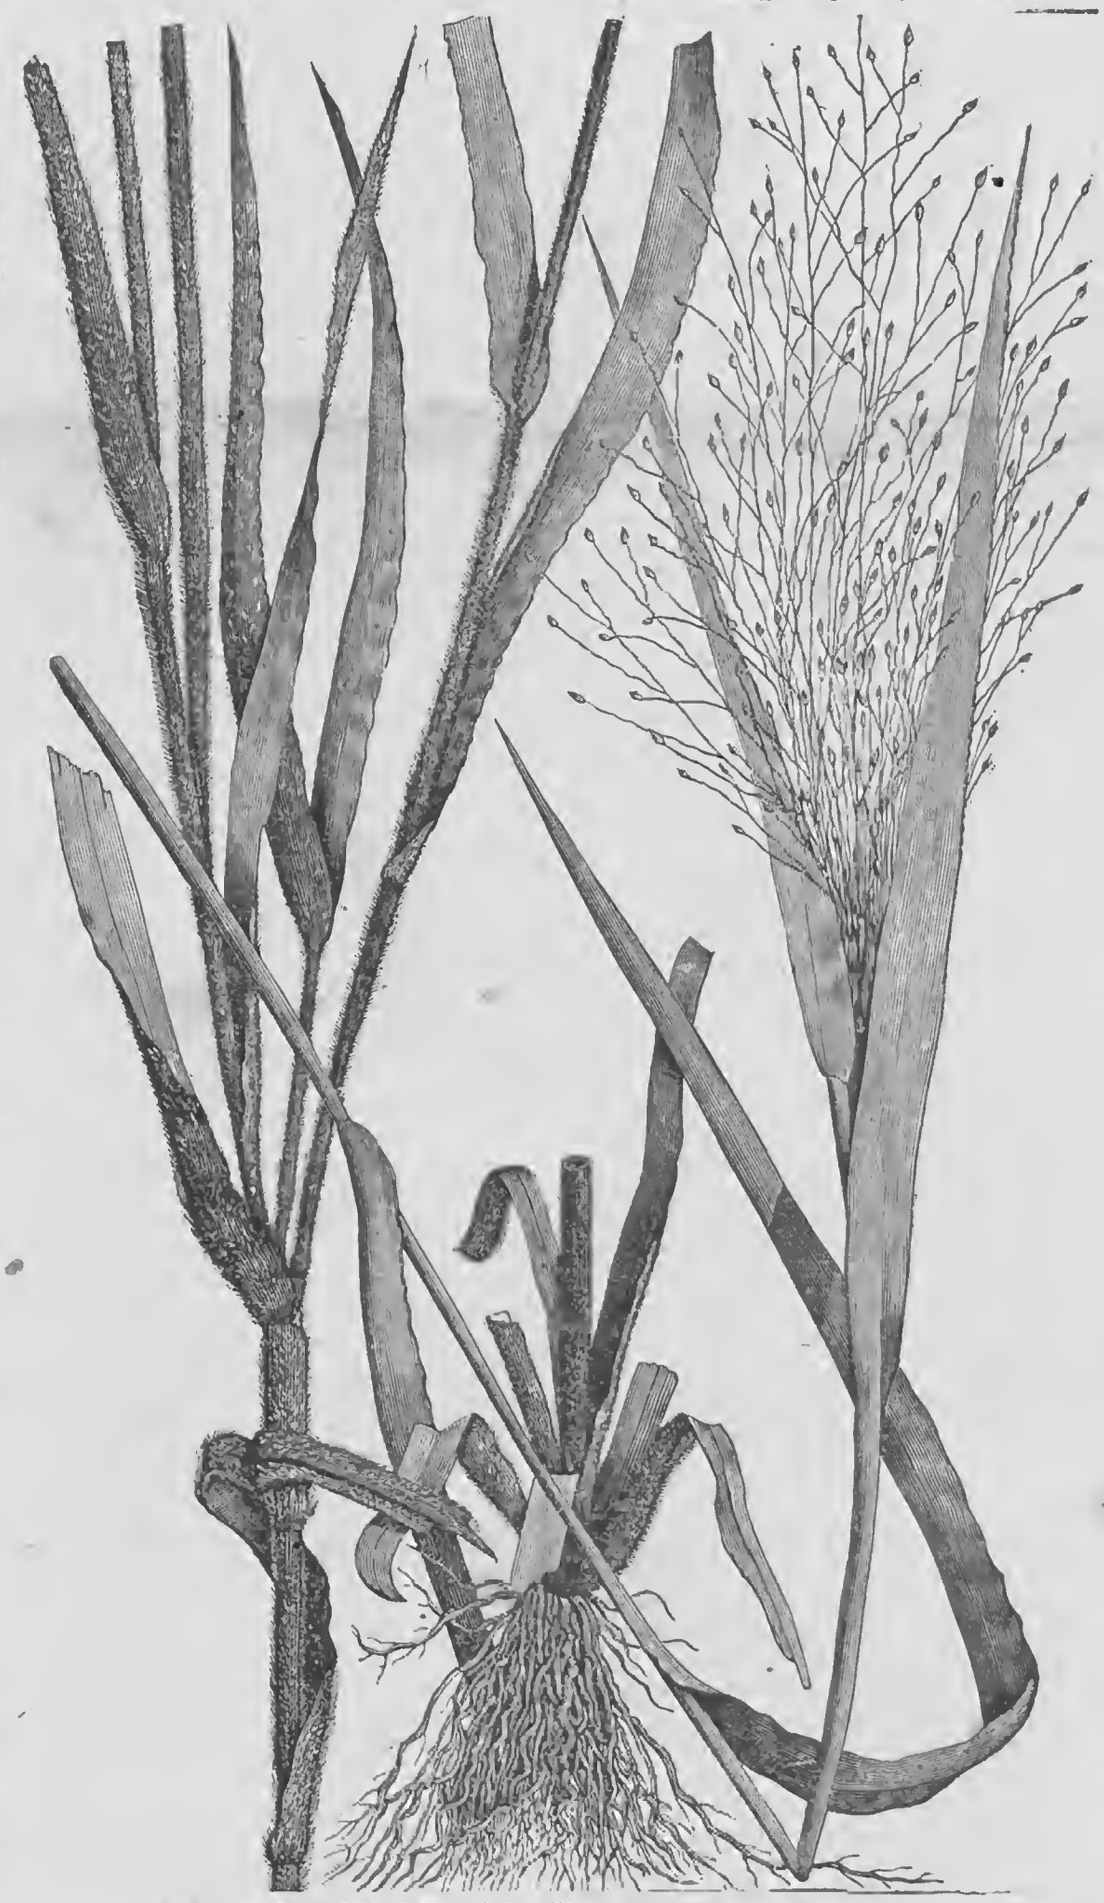
PROF. W. J. BEAL.

TOBACCO-GROWING NOTES.

As tobacco worms continue their work of destruction upon tobacco plants through the whole growing season, the work of "worming" must be continued as long as the crop remains standing in the field. It is also important that no worms are upon the plants when hung in the curing barn, as they will there continue their depredations until the plant has become partially cured, causing much damage to the crop.

THE selection of seed is an important point in tobacco culture. As a general thing, it is best for growers to raise their own seed, as they may then be certain of procuring a good article. Unless great care is exercised in choosing the plant from which seed is to be saved, the variety, or the strain of the variety grown will deteriorate in quality or "run out." The best plants for seed are not usually those first to show their blossoms; but those of medium earliness that have rich, healthy color with large, well developed leaves closely set upon the stalk. The top should be trimmed to a single seed-stalk so that the seed will become more perfectly developed. When the seed is perfectly ripe—which may be known by the tips and seed cups turning brown—the plants should be removed and hung up in a dry, airy loft until cured, after which the seed may be shelled out and put away for future use. Tobacco seed will remain good for many years if kept dry. When a desirable variety or strain has once been secured it is well to save enough seed to last a number of years, which will prevent the deterioration so common with most planters when seed is saved each year for use the succeeding year.

THE tobacco plant-bed should not be forgotten during this season: in order to prevent it from becoming foul with the roots and



OLD WITCH GRASS, HAIR GRASS—Fig. 419.

seeds of grass and weeds it is necessary to prevent grass and weeds from growing and maturing their seeds in or about the bed. This is best accomplished by frequently forking and raking over the soil in the bed during the months when it is not in use. It is well also to apply to the bed a liberal coating of manure, that it may have time to become thoroughly rotted and mixed with the soil before the bed is again needed for plants. With this management all seeds that may be in the manure will germinate, and the forking over of the soil will destroy them. A little care thus exercised in the after management of tobacco plant-beds, will greatly lessen the labors of next year's plant growing and go a long way towards insuring good success in the work.

As the season for harvesting tobacco approaches, the grower should look to his curing barn, and if not already in readiness for the work of hanging the plants, no time should be lost to put it in proper order. Let the building be cleared of all rubbish and of whatever else it may contain that will be in the way of free working, so that there may be little delay when the harvest has been once commenced. Materials and implements needed for the work should be procured in good season and everything made ready.

THE natural desire of the tobacco plant to produce seed shows itself clearly even after the top of the plant has been broken off in the process of "topping". Side or lateral branches start out at the axils of the leaves, which would ultimately form blossoms and seed if not prevented, thus sapping the stalk of the the elements which it is desired to contribute to leaf growth. Hence it is that these sprouts, or "suckers," should be broken off as fast as they appear. The work is termed "suckering" and must not be neglected.

Chemung Co., N. Y. G. A. G. JR.

COST OF WHEAT GROWING.

WALDO F. BROWN.

IF every farmer could be induced to keep an account with each wheat field sown on his farm, I believe it would do more to improve his methods of management than anything I can suggest. The farmer likes to be paid for his labor as well as any one else, and a careful account kept with his wheat, would soon show that all the profit came from the bushels grown above an average crop, and that the cost per bushel decreased in proportion as the bushels per acre increased. I began keeping an account with my wheat in 1877, with a two-acre patch. My account with it is as follows:

Breaking two acres	$ 3 00
Harrowing and rolling	4 00
Seed wheat 1¾ bushel	1 80
Drilling	80
10 loads of manure	5 00
Harvesting	3 50
Total	$18 10

The two acres yielded 70 bushels of wheat which sold for 85 cents a bushel, making $59 50. Deducting the expense, it leaves $41.40 net income from the two acres. I have allowed nothing for hauling and thrashing, because after a careful estimate I believe the straw is worth to me this amount. But even deducting this, which I estimate to cost 13 cents a bushel, it leaves $32 30, and counting the land at $75.00 per acre and eight per cent. or $6 an acre, for the use of the land, it gives a net profit of $20.30 besides the straw. In 1878 I kept an account with a six-acre field. Four acres of this were corn land and the other two acres, the same as above.

Plowing, harrowing and rolling	$13 50
Picking off corn butts	5 00
5½ bushels of seed at 90 cts	4.95
Drilling	2 40
Harvesting	9 60
Total	$35 45

This field yielded 30 bushels per acre, or 180 bushels, and was sold at 95 cents per bushel, making $171.00, less $35 45, equals $135.55 or $22.59 per acre for rent of land, estimating that the straw paid for hauling and thrashing. The cost of this wheat per bushel, after allowing $6 an acre rent for the land, is a fraction less than 40 cents, or, if we do not count the straw anything and add 13 cents per bushel for hauling and thrashing, 53 cents. The same Fall I sowed 11 acres of wheat on some cheap land. I bought, in the Spring of 1877, 50 acres of run-down land for $1000, and these eleven acres were a part of it. About seven acres of it were corn land, and the remainder beans, potatoes, and millet. The crops were very light, all of them, scarcely paying for the labor. The expense account with this field is as follows:

Plowing, rolling and harrowing	$33 00
Forty loads of manure	20 00
One barrel of bone meal	5 00
Eleven bushels seed wheat	11 00
Drilling	4 40
Harvesting	17 75
Total	$91.15

Credit 241 bushels of wheat at 95 cents, equaling $228 95, making for the use of the land $12.52 per acre, or more than half of the cost of the land; or, if we count the straw nothing and charge 13 cents for hauling and thrashing, it still leaves over $9.50 per acre for the use of the land. The cost of this wheat,

not counting the rent of land and balancing the straw against hauling and thrashing, was about 37½ cents per bushel. I have charged manure at only 50 cents a load because I find its benefits extend through several years, and I think this is all that ought to be charged to one crop. I can buy good manure delivered on the field for $1 25 per half-cord load.

The next year this same field was put in wheat at an expense, when harvested, of $97 62 and the yield was but 15 bushels per acre, which brought the cost of the wheat to nearly sixty cents a bushel, not including ground rent or thrashing. From the accounts kept with my wheat crop during the last four years, I find that the crop must exceed twelve bushels to the acre, or else the price must be considerably above one dollar a bushel, to meet expenses. I have never grown a crop of 20 bushels or upward to the acre, that did not give a fair profit, and when I have raised 30 bushels to the acre and sold for much above a dollar a bushel, I have found it largely profitable. In closing this article I wish the honest opinion of the RURAL readers as to the value of straw. I have been severely criticised for saying that the straw would pay for hauling and thrashing. What do experienced farmers say?

Butler Co., O.

WHEAT IN IOWA.

IN the early settlement of Iowa 25 or 30 bushels of Spring wheat per acre were considered a fair yield. The average crop, of late years, has so far decreased that hereafter very little wheat will be sown in Central Iowa.

In my experiments with the various wheats two very important points in successful wheat culture are apparent: 1st, the want of an extra-early variety not easily affected by rust; 2nd, the need of a special fertilizer adapted to the perfect growth and development of the plant. Aside from the result of experiments establishing this fact, there is abundant evidence to be found in the wheat fields of any county in our State. This assertion applies to all kinds of soils, provided they are well drained. I send you a list of wheats, all grown under similar condition (on a clay loam), with the remark that this year has proven to be the most unfavorable, not only for wheat but for *all* other crops, ever known in Iowa. The various Russian wheats named in the list, though in appearance they promised to be very fine, being entirely free from rust or blight, failed to mature at the proper time. The grain was shrunken and a very peculiar insect destroyed a large portion of it, though on no other variety was this insect observed.

I give the names of varieties in the order of their evident relative value for this year, judging only by the number of pounds they have yielded per acre.

I have carefully noted the habit of Mr. Pringle's hybrids for two years, and while I have no disposition to defraud Mr. Pringle of any merit due him as an improver, I must say that I have failed to observe the faintest indication of a hybrid or cross production, and would place them on record as the first and only exception to the rule, viz., that all hybrids or crosses are less fixed in their characters than an established variety.

Finally, I cannot close this article without referring to your efforts to introduce new and valuable additions to our list of farm and garden products. I hope and believe that your work will be appreciated. I acknowledge myself your debtor on this score, as well as for the many practical suggestions found in your excellent paper. W. T. SCOTT.

Polk Co., Iowa.

CORN RAISING IN CENTRAL NORTH OHIO.

THIS is how we raise corn in Central North Ohio:—In the first place we tile the low places, dig out all the stumps, raise all the stones within reach of the plow and draw them all off; then break up in April, plowing sod five or six inches deep. Then we harrow thoroughly before planting, and plant about May 20, using a two-horse, three-row marker; then we plant with a two-horse planter from three and a-half to four feet apart each way, putting from three to five grains to the hill; we next go over it with the harrow, straddling the row, before the corn comes up; then cultivate as soon as possible, first with the iron "fuke," then with the two-horse walking cultivator at least once a week, if big rains don't interfere. We cultivate shallow above the sod. It is never too dry to work soon. Going over four or five times will bring harvest, when there is no more time for corn plowing.

After breaking sod this depth, next year we plow an inch or two deeper and we have a soil seven or eight inches deep—enough for practical purposes. Our soil is a black loam with a stiff clay subsoil. This same field we plant in corn three or four successive years. The universal practice is to shock the corn in the field, 12 hills square—144 hills—husk, and feed or crib it in the Fall. Put the fodder two or three shocks in a place; tie it well; then haul out and feed when wanted, but if possible when the ground is dry, as treading injures the fields.

After three or four crops of corn, then we sow wheat in the corn if not ripe early enough to cut. The next year we break up soon after harvest and sow wheat in September, putting a peck of Timothy seed to the acre and in the Spring half as much clover. We use no fertilizers; hence it is not best to run land too low—three or four crops of corn and two of wheat are enough. By rotating crops in this way, and by not pasturing too closely, land will improve. Under this treatment mine produces 50 per cent. more than it did 20 years ago, yielding of shelled corn from 40 to 75 bushels and of wheat from 20 to 30 bushels per acre. Corn land rents for half in the shock; wheat for one-third in the bin or half in the shock. Wages, $18 a month; by the day, $1; in harvest, $1.50 per day.

Scott, Marion Co., Ohio. W. J. V.

An Interesting Report.

I mail you to-day a few heads of Golden Grains Wheat sowed March 21; it is not ripe yet (Aug. 8) and is blasting badly owing to rust and dry weather. I do not think it will mature. I obtained the seed from J J H. Gregory, Marblehead, Mass.; it was represented as being a Spring wheat in the South. I send a sample of the seed Mr. Gregory sent, also two heads of Arnold's Victor, sowed last Fall. I dug the White Elephant Potatoes on August 8th the yield, as anticipated, was enormous. The potato received I think would not exceed three ounces. It contained 13 eyes. I cut it in 13 pieces, making as many hills, and planted them on April 11. Every eye came up and grew vigorously. I weighed the tubers when dug and got 336 ounces, or 21 pounds, of good potatoes. I weighed six tubers that weighed four pounds or an average of 10⅔ ounces. I shall save what I have for seed. I procured from Benson, Manle & Co., Phila., one pound each of Beauty of Hebron and Watson's Seedling Potato. The package of Beauty of Hebron contained three potatoes from which I made 26 hills. Watson's Seedling contained five, making 31 hills. I planted both March 26 dug them on June 22 and got 38 pounds of nice, smooth potatoes of Beauty of Hebron, and 46 pounds of Watson's Seedling so nearly resembling Early Rose that I am unable to distinguish them. Farm Topics.

ENSILAGE AT THE WEST.

W. I. CHAMBERLAIN.

YOUNG mothers complain that for sound advice on nursing babies and training children, no one can equal the traditional "old maid!" And so I am not at all surprised that those who have tried ensilage are restive under the criticisms of those who *have not*. And yet they provoke criticism by their tone and manner (of which I shall speak again) and by losing sight of certain general principles.

One of those general principles is that "circumstances alter cases." Ensilage may pay in France or Massachusetts, with dear lands and cheap labor, and not in Ohio or Illinois, except near cities or under peculiar circumstances. I have before me three essays on "soiling," two of them prepared, delivered and published in 1819. They were by that fine writer and able statesman, Josiah Quincy, of Massachusetts. His arguments then, 52 years ago, in favor of "soiling" were essentially the same as those now used for ensilage; viz.: economy of land, fencing and food; increased product of milk and manure; and better condition and greater comfort of the cattle. His facts were moderately and truthfully stated, and his arguments were fair and courteous, and were conclusive for his latitude and longitude—twenty miles from Boston. Fifty-two years have passed and soiling has not been found to pay except in a few city localities. And ensilage, its younger sister, will probably succeed under similar circumstances, and be a necessity when our population is five hundred (instead of fifty) millions.

In marked contrast with Josiah Quincy's little book have been the writings of the apostles of ensilage—the "new dispensation." They have largely been marked by a certain swell and swagger, a kind of "It's so and you're a fool if you don't believe and practice it." The "facts" have often been exaggerations, the figures untruths, and the arguments the sheerest special pleadings. Everything has seemed to have an air of extravagance and even of charlatanry, that antagonizes and puts one on the defensive.

The question is, does the evidence thus far warrant the adoption of ensilage at the West, or even its trial. For the change must be radical and most expensive, and should not be made except on the fairest, most candid and disinterested evidence—just the reverse of that thus far offered. I say the change is radical. Ensilage is called a "new dispensation." Our barns, tools, implements, methods, help and training; in short, our whole system of agriculture is adapted to the old. Succession in farm labor, diversified farming and rotation of crops distribute the labor through the year as we can handle it. Shall we change all this? Again, land is cheap and rich at the West, and we have more than we can till well even under our present system. Shall we immensely increase the necessary labor, and mass it at one time of the year? Again, we have more coarse feed, straw, corn-stalks, etc., that we can feed to our stock now, shall we increase and ensilage it?

I note a few of the assumptions of the "new dispensation" that lack proof:—that grass loses immensely in nutritive value by (properly) curing; that if succulent food is best in Summer and for one purpose, it is also best in Winter and for all purposes. Man craves succulent food in Summer; but at zero he asks something more solid than cucumbers, melons and radishes. Possibly cattle have similar tastes and requirements. It is assumed that the milk is as rich from ensilage as from rightly cured clover hay. But June milk is hardly half as rich as that of October, when the grass is not so rank and succulent. It is assumed that the alcoholic element in the ensilage will not injure either the cow or her product or progeny, whereas several years may be required to establish this important negative. It is assumed that if ensilaged maize will keep most cows per acre, it is necessarily most economical, whereas this is purely a question of local prices and circumstances.

If one wishes to keep the largest possible number of cows per acre, probably maize or roots (with some meal) will do it, simply because they will *stand more manuring*. All the other grains and grasses will lodge with too rich a soil. Maize will not. And if maize is to be used for Winter, it must be ensilaged or left in the field in shocks. It cannot well be cured like hay for storage, or buried in trenches like roots.

In short, the whole question is one of local circumstances. A few city milkmen in Ohio are building silos. For them it will probably pay. For the average Western farmer, probably not. For the most of us it will probably be wisest to "go slow."

Columbus, Ohio.

THE EVAPORATION OF FRUIT—NO. 3.

J. G BINGHAM.

Its Benefits.

IN properly evaporated fruit there is no loss of pleasant or valuable properties, but an actual increase of fruit sugar, from the fact that evaporation is essentially a ripening process, the development of sugar ranging from 10 to 25 per cent. in different fruits as determined by chemical analysis. Instead of a retrograde transition awaiting our really unsurpassed fruits, berries and vegetables at their full stage of ripening, we have in the use of the evaporator a culmination of the same organic forces, and in a few hours the juices, which heretofore formed and perfected the fruit (but which after this hasten decay) are quickly matured and the maximum development of sugar secured and the water evaporated, the change being analogous to the transition of the grape to the sweeter raisin, or the acid green apple to ripeness, with corresponding delicacy. The cell structure remains unbroken and the articles when placed in the rejuvenating bath of fresh water return to their original form, color and consistency. Thus, a few ounces of pumpkin flour make a sauce or custard at all seasons, and rarely can an expert distinguish a pie or pudding of evaporated apples from that made from fresh fruit, by sight or taste. The Summer squash becomes an all-the year vegetable for every climate and market on the globe. A large load of pumpkins may be driven in from the field in the morning, and the next morning shipped to the antipodes, in a barrel. The sweet potato which perishes so rapidly as to be unknown to most of the markets of the world, is reduced to an imperishable condition by pneumatic evaporation, and will soon become a familiar luxury on the tables and markets of the world, and at all seasons of the year alike. Its slices, placed in cold water and brought to a boil for 30 minutes, are ready for the table or frying pan, and are in no respect inferior to the original vegetable. The Northern potato, like the turnip, improves by evaporation, and for Spring use, for ship stores and for exportation, leaves its original out of sight, occupies little room and is proof against decay.

Sweet corn is rejuvenated. If taken strictly in the milk and treated before wilting, it will be as tender and sweet at the world's end as at the start. Green currants and gooseberries retain their favorite characteristics of flavor sealed up in them for travel and time. Forty pine-apples have been compressed into a small cake which an infant might hold in its hand, and afterward resurrected as 40 pine-apples. The evaporated tomato is a remarkable product. No successful attempt had ever before been made to remove the condition of fermentation (water) from this fruit. The pneumatic evaporator reduces the whole pulp of the tomato to a condition like that of the dried fig. A bushel of the fruit after evaporation, is compressed into a solid cube like plug tobacco, measuring four or five inches each way. Every pound of this makes eight quarts of tomatoes in the original state. Tomatoes may now be raised with advantage, like so many other things wherever there is an evaporator at hand. The manufacture of evaporated fruit by the individual farmer and orchardist has popularized the industry, the future of which it would be difficult even to anticipate. With an apparatus of universal adaptation and suited to the wants of the large or small orchardist and fairly managed, the business is made both remunerative and pleasant. Few farm implements can be so continuously employed, beginning with the early Summer berries, vegetables and fruits, extending its usefulness through the Winter upon the Fall crops, the daily wasting products of the farm suggesting its use and inculcating the maxim, "It is not what we make, but what we save that accumulates wealth."

In the close rivalry and competition of the markets, it is interesting to note the high reputation that American evaporated fruits have lately obtained abroad, and that the industry yet in its infancy has accomplished so much. It certainly promises to become a fertile source of revenue to our agriculturists.

McGrawville, N. Y.

Horticultural.

THE RURAL has asked for reports from those who have used sawdust as a mulch for strawberries. "Wallace" says he tried it this year, and considers it worthless, as the berries rotted badly by lying on it. The past season, however, was so wet that strawberries rotted badly with mulchings of all kinds. I have found sawdust to be a good mulching when the ground is not too thickly covered with it, and I have seen it used by others in an entirely satisfactory manner, though some have thought it produced an injurious fungus, which I have been unable to discover. There were writers among us at one time who fairly had fungus on the brain, and who saw in it the latent as well as the apparent cause of all the ills that plant life is afflicted with. I remember that some years ago the Cheney Brothers (the large silk manufacturers) used sawdust very largely as a mulch for strawberries, and may do so still. Your correspondent, Mr. Goodman, of Lenox, saw these large beds many times, and will probably admit that he seldom saw better. One trial is insufficient to prove the value of a mulch of this kind, or, indeed, of any kind. Roofing slate and cedar shingles make the best mulch for strawberries I ever used.

I WAS at Mr. Battey's with the visiting committee, and will state that the Wilson (as well as Russell's Prolific) was growing in beds adjoining the Manchester, the Wilson being chiefly used as the fertilizing plant. The Wilson and the Manchester had been growing side by side in this way for several years, and no better opportunity or conditions for comparison could have been asked for. Mr. Allen is unquestionably right in saying that the past moist season was a good one for growing strawberries in sandy soils like that at Manchester; but the Wilson was unmistakably beaten, not only during the past moist season, but also during the exceptionally hot and dry one that preceded it. It seems to have been the fact that the two varieties had been grown for years in adjoining beds, that determined the visiting committee to use the Wilson as the subject for comparison, several members hav-

ing seen them thus grown together for years past. There were not a few old friends of the Wilson present, but there was no difference of opinion, so far as I could learn, as to the superiority of the Manchester. I am of opinion that we have in the Manchester a plant with all the vigor, ruggedness and productiveness of the Wilson, and a very much better fruit.

Let me say a word or two in support of "Stockman's" position about the gad-fly. My observation is to the effect that there is always an orifice in the skin immediately above the larva. Several years ago I made a prolonged visit at Mr. James Todd's, an extensive Orange Co., N. Y., dairy farmer, and a good one, too. (This is another family of Todds). Well, Jimmy Todd, Jr., and I used often to go up to the barn and squeeze the larvæ out of the back of the old bull, just as a man squeezes the so-called black-headed worms out of his nose or his face. The old fellow seemed to be grateful for it. There was no necessity for making a hole, for there was always one already there.

There is a ring of the real metal in Mr. Bensel's remarks on the quality of grapes, p. 516. Evidently he is a lover of *good* grapes and knows one when he sees it. He might have added the Delaware to the Catawba, so far as the New York market is concerned, for it at all times brought double the price, and late in the season five to eight times the price, of the Concord, as did also the Catawba. I think the Brighton has now been sufficiently tried to be admitted to the select company of good grapes; but in regard to some others, I prefer negative goodness to positive badness. My theory has always been, that to secure good grapes you must first educate the public taste, and that the public is now at last doing for itself reasonably fast. There is a good deal still to be said and done on this subject.

I have said that I began picking the Caroline Raspberry on the 4th of July. On the 4th of August five plants were picked, and furnished an abundant supply for a party of nine. I think this quite equals the editor's picking.

I. J. B. says the Spanish Chestnut is not hardy, according to his experience. This, to some, will be discouraging. On the other hand, there are quite a number of large bearing trees within 50 miles of New York (in Westchester Co., in New Jersey, on Staten Island, etc.,) that were not injured last Winter and are now in fruit. Some of these trees must be quite 40 years old. Those of Mr. Meyer, on Staten Island, I think are about 18 years old. These examples would go to prove the hardiness of this chestnut in a general way. B's trees were probably exposed to some local influence that helped to kill them.

A large and well-grown plant of the Blue African Lily (Agapanthus umbellatus) is a very beautiful subject for the lawn. Its long and gracefully curved leaves and large umbels of brilliant blue flowers make it indeed, as its name indicates, a plant to be loved. It is now (Aug. 8) in full bloom with me. It is much too seldom seen, but once successfully flowered, is not likely ever again to be abandoned. I prefer to grow it rather closely in a pot; and I not only keep the pot out of the ground, but elevate it on the the top of another. The effect will be even better if the plant be grown in a vase. It is only in this way that the full beauty can be seen and appreciated. It should be daily and abundantly watered, and when thus treated does better in the sun than in the shade. It will keep well in a cool cellar during the Winter, and bloom all the better for its rest. There is an interesting but rare white form of this.

On looking over the strawberry beds I find the Sharpless very badly browned by the drought and heat; much more so, indeed, than any other variety I have. I find this to be the case wherever I have seen it this Summer. [Not so at the Rural Grounds.—Eds.] It would appear to be a characteristic fault, and I am sorry it is so. The Bidwell bears the heat about as well as any and looks well. It promises to take a permanent place among the "creams," that being the proper word just now in polite horticultural circles. Next it will probably be the "cream of the creams," a sort of very high-toned horticultural aristocracy. Horticola.

RAYS.

Yes, Mr. Parnell, the climbing cobæa is a handsome vine. An old lady, a neighbor of mine who has no greenhouse, has a very big cobæa; she plants it out in May and runs it up on a trellis alongside of her parlor window, and away it goes from the trellis-top on strings to the chamber window above, a thicket of vines and leaves and full of its big purplish blossoms. In the Fall she shortens back the vines, lifts and pots the plant, keeps it for a while on the piazza, and then sends it to bed in the cellar till April, when it is again brought forth to the piazza so that the influence of sun and moisture may start it a little before planting-out time comes.

* *

This old lady is a great gardener; she has a large, rough yard but a multitude of plants and blossoms. She saves her own seeds, exchanges with her neighbors, and in this way increases her stock. Her heart is in her garden, and, weather permitting, she is nearly always there herself; this strict attention gives her good results; she saves and preserves her plants while her neighbors by oversight lose a lot, and in order to recuperate their store must buy or get afresh. They so arrange it that they buy what our old lady has not got, share with her and she with them, or, in other words, the neighbors furnish the money and the old lady the brains.

* *

The Rural folks have so much to say about strawberries, that, like myself, I reckon they have a biting fondness for them. All the people hereabout are planting the Sharpless and many cannot get enough of it to plant. It is late, a rank grower and heavy cropper, and has large but very homely berries; "putting-up" is the end they have in view.

* *

I was amused the other day to find in one of our most pretentious gardens, the owner of which is worth his millions, in a moist and faintly shaded nook, a patch of our common wild strawberry evidently well cared for. The garden sorts had finished bearing some weeks since, but there were still a few good berries on these wildlings. The gardener told me his employer was very fond of the wild strawberries, and especially so after the garden kinds were past.

* *

"G. G's" Tobacco Notes' p 499, prompt me to say that if all others used as little of the weed to smoke, to snuff or chew as I do, Lorillard would never have been rich enough—at that business at any rate—to own Iroquois. But, notwithstanding that, I have a fondness for the living weeds. There are the night-blooming, white-flowered sorts, as profuse and bright as evening primroses and many of them are sweetly fragrant,—for instance N. suaveolens. Indeed, Mr. Cullingford of London, Eng., in the Garden, goes so far as to predict that a kind (N. affinis) he grows, for elegance and fragrance will rival the tuberose. And if you want a rival to the Blue Gum or Fever Tree of California, try N. glauca; its flowers are nothing, but its handsome, tree-like form and bluish cast throughout render it a prominent ornamental plant where there is plenty of room. And the showy, red-blooming varieties of the big-leaved kinds are not amiss as decorative plants.

* *

"H. A. P's query, p 503, reminds me of the many stupid notions that are afloat regarding watering trees. I often see men and women spill a pailful of water around the stem of a lawn, street or orchard tree and think they have done a good thing, but they haven't. The absorbing rootlets are not there, but instead, the bulk of them are about as far away from the stem of the tree as the branches extend, therefore, it is there and not at the bole of the tree the water is needed. Observe an isolated, thrifty tree: it rains, and you get underneath its boughs to get away from the shower; you keep dry while beyond a little way the water comes down from off the leafy branches as if off a shingled roof, and that is just where it is needed, where it can do the most good; for it is there the fibrous roots prevail. And just about as stupid a practice is the annual piling of manure around the trunks of trees; the manure is needed where the water is and no nearer. But in the case of a general plantation or orchard where the branches of the several trees meet, the rootlets are all over the ground, but much less so at the boles of the trees than elsewhere.

* *

It is no uncommon sight to see the hogs wallowing in the earth or mud around our Western doors, ducks and chickens stepping in and out of the house, the dogs at rest upon the bed or elsewhere, where they choose—man and beast complacently contented. And what a sight, what a state of things in this progressive age! breeding stench and filth and fleas, erasing the healthful comfort that is proverbial to the farm, which it renders little purer than the poorer tenements of city streets. But in this respect the West is not more erring than the South where swine often make their homes beneath the human dwellings. There, houses are usually set upon blocks or pillars, rather than over cellars, as is the case in the North. This pig-home, dry and dusty, is a paradise for fleas. Because this indifference may affect some of our neighbors, that is no excuse for us; on the contrary, we should the more emphatically endeavor after greater cleanliness, and thereby induce our neighbors by example to forsake their thriftless heedlessness.

* *

Now is the time to go into the woods and meadows and gather fern-fronds for winter bouquets. They are plump, fresh and green, and if gathered now and dried, will be far prettier than if left till their vigor fades and their color becomes yellowish. People usually delay gathering fern-fronds till they go out hunting after Autumn leaves, but it is wrong. Lay in a store of airy grasses as well; gather them when they are in flower just before they bloom. If gathered after they have gone out of bloom, their scattering seeds will be a littering nuisance during the Winter months. And if you have sown a lot of "everlasting" annuals their blossoms will brighten up your bouquets. Cut the buds before they are fully opened; they will open in the drying and appear clean and fresh, whereas if delayed till fully expanded their centers will look old and dirty and with age become undone and scatter about. Be on the outlook for clematis wreaths. As soon as the seeds begin to swell a little and show their silky tails, gather your wreaths; they may appear immature enough at gathering time, but when dried, they will floss out whiter and softer than if they had been gathered when older. Those who live near the sea can get any quantity of sea-lavender or marsh-rosemary as it is also called, growing in the salt-marshes; the flower-bunches make splendid "everlastings." But remember, gather early, if you wish good material and pleasure of it.

* *

It would add materially to the interest in the summer display of our public gardens if a few beds in suitable places were filled with economic plants as castor beans, paper reed, cotton, hemp, india rubber, tea, coffee, sugar-cane, tobacco, fever tree and the like, and each plant legibly and neatly labeled. True, these plants may already be seen in our public grounds, but when mixed in clumps with other plants, who knows what they are? Our public gardens should instruct the mind as well as please the eye. Let us take a group of palms for instance: How much more instructive it would be to have the clump consist of the wine palm, oil palm, ivory palm, date palm, sugar palm, cabbage palm, walking-stick palm, and so on, than to have them nameless and to the uninitiated unknown, stuck hither and thither in beds or vases for appearance's sake alone. Plant them for effect's sake if you will, and how and where you will, but group them also and tell us what they are. Because of their great diversity in leaf and shape they cannot make a formal bed. Our bananas, too, are noble plants, and many who want to know them, seeing them, have no means whereby to recognize them. A neatly painted label would give us light.

* *

The Trumpet Vine is loaded with its blossoms now, and what a splendid thing it is! Running up a naked tree trunk, set upon a pillar by itself, trained up by the water spout at the corner of the house, the posts of the piazza or the door-porch, it matters not; its roots stretch deep into the earth and more beyond the influence of Summer drought than many vines; its hard and woody stems reach as high as twenty feet or more, and from them droop on every side graceful, leafy wands, each one tipped with a bunch of trumpet blooms. Sometimes these wands are winter-killed to the hard-wood, but it matters little, fresh ones come forth in quantity and all will bloom. The older the vine is the more it will bloom. Beetles, bugs and caterpillars pass it by, it is not to their liking. But the prettiest way of growing it I have seen is in its wild state, where by the edge of creek and river bottom timber belts it drapes and mantles trees and bushes as grape-vines do in the North.

* *

I observe the Rural notes regarding the hardiness of Japanese maples are causing quite a stir. Most growers prefer the maples as they do roses—on their own roots, and suggest that nurserymen propagate by layering. Nurserymen do raise what they can from layers, but the mode of increase is slow; they want to economize every little shoot they can remove in pruning, and the only feasible way of doing so is by "working." But I would suggest that a trial be given to our common mountain maple and some of the smaller species of the Rocky Mountains, as stocks to work the Japanese maples on. If any of your readers have already done so, would they please report with what success.

* *

What an aversion there is to yellow flowers in California! The florists tell me that even so good a thing as an allamanda bloom would ruin a common basket of flowers. I wonder if they will show equal antipathy to the lovely wreaths of dendroblums, the airy sprays of oncidiums, the fragrant blooms of lemon cattleyas and many other orchids when these floral aristocrats of India and Brazil become common with them? I reckon not. Fashion governs the popular taste. It will take some extra-fashionable party and the reigning light thereof to show partial taste for yellow flowers—and orchid blossoms are the only flowers in such a case that will command that taste—to break this formidable prejudice. Leon.

IN THE GARDEN.

We have a most beautiful bed of flowers from the Rural seeds. I started the plants in a cold-frame, and then transplanted them out in a rich piece of ground, and they did finely. I also have about 150 asparagus plants. The potato beetle so nearly destroyed my White Elephant potatoes when they first made their appearance above the ground that in despair I hoed them up. The other seeds I did not plant.

The present season has been exceptionally good for all hardy vegetables. From thirty rods of ground I harvested 50 bushels of Alpha peas in the pod, and I think I would have had 60 bushels if I could have let them stand another week; but a more valuable crop crowded them off the ground. They were planted in rows three and a half feet apart five or six inches deep; and were brushed with brush about four feet high; they were kept well cultivated, the last hoeing being given just before picking. They were just one week later in ripening than the same kind of peas were last year. The pods were large and well filled and were so easy to pick that several mornings I went out and picked a bushel before breakfast, or in an hour's time. They were of extra quality, and sold for twenty-five per cent. more than other peas. They averaged about $1 40 per bushel. The 30 rods of ground are now occupied by 500 heads of cabbage, 1 800 heads of celery plants, 200 hills of cucumbers, three by three and a half feet; and one row of beets, 15 rods long. The cucumbers were planted close up to the rows of peas and they got nicely started before the latter were removed. The cabbages were also set out about one foot from each side of the rows of peas. After these were removed I gave the cabbages and cucumbers a good hoeing and worked in a handful of phosphate around each hill. By the way, my early crops turned out so well that I gave the ground an extra barrel of phosphate over and above the regular allowance, just to encourage it to do well in the future. For the past five years my acre of land has made an average increase of 100 dollars each year in the value of its products, and this year will not be an exception. This is what I call progressive gardening—keeping up with the times so to speak. Adelbert Wakefield,

Oneida Co., N. Y.

The most satisfactory Strawberry.—If I were asked which strawberry I would recommend as most certain of pleasing everybody, I should say the Cumberland Triumph. Its size is very large and there are few small berries. It is very prolific, being in this respect almost equal to the Wilson and Crescent. Its shape is perfect; its quality hardly inferior to that of Monarch of the West and Triomphe de Gand. It stools well; is good on all soils; has a strikingly handsome, dark green foliage. It is, in fine, sure to satisfy. Among 18 kinds I would on the whole prefer it, if confined to one. For a short and excellent list covering the season take Duchess, Cumberland, Monarch, Triomphe and Kentucky. Sharpless and Bidwell I do do not know enough about, but so far think they should make, after Duchess and Cumberland, the main planting. Probably the Bidwell and Cumberland will be the two best. Duchess is by far the best very early.

A Remedy for the Rose-bug.—One of the Rural correspondents begs for a remedy for the rose bug. The following recipe is absolute. Fill an ordinary sprinkling pail with water, put in three or four spoonfuls of hellebore and two spoonfuls of kerosene oil. Keep it frequently stirred and sprinkle the rose bushes just as the slug begins to work. It will need but one application to entirely get rid of the pest. E. P. Powell.

Dairy Husbandry.

THE DAIRY COW.

HENRY STEWART.

The Vices of Cows.

Cows are given to few vices, and all that belong to them are caused by faults of management. The most troublesome are the habit of kicking, holding up the milk, and sucking themselves. Cows are caused to kick by fear, and the act is an effort to defend themselves. Some young heifers may kick when first handled in the effort to milk and from nervousness, but if they are gently used this trouble is easily got over and nothing further may be seen of it. But if the young animal is beaten

or whipped, especially if this is cruelly done as is usual in such a case. the association of the punishment with the act becomes fixed upon the memory, and ever afterward the cow may be a kicker, because it naturally expects the punishment at milking time and tries to defend itself from it. The frequent change of ownership also greatly helps to produce this habit, because some cows will resent the approach of a stranger; but this only happens with very fretful cows or those which have been habitually ill-used.

This habit may be prevented by the cautious and kindly treatment of the calf and heifer before she becomes a cow. A young calf will usually make an attempt to kick when the udder and teats are handled, but the objection is soon removed by gentle persistence in the treatment previously recommended both for calves and heifers, in regard to handling, brushing and other familiar attentions. A cow that has been thus reared and trained will never become a kicker except by very brutal treatment. To cure this vice is sometimes, if not always, easy. I have never found any difficulty about it by using patience and kind and gentle treatment, notwithstanding some occasional relapses and annoying accidents. The method of treatment has been as follows:—

First, to secure the confidence and friendship of the animal; second, to approach her cautiously, both to avoid alarming her and to secure myself against an attack; lastly, never to strike or punish the cow for an attempt to kick, but, instead, to soothe her and so remove the fear of danger which has given occasion for the kicking. All this may be done by gently patting and stroking the cow, speaking to her when approaching her, and familiarizing her to the handling. After this milk her in a small pail, which can be held so that it cannot be upset, and with the left arm pressing upon the cow's leg so that a kick can be warded off as much as possible. While milking, the cow is spoken to, to attract her attention, and every movement about her should be slow and deliberate, so as to avoid anything to cause her to suspect that a blow might follow the movement. When the milking is safely over the cow is petted and spoken to, and a handful of meal or oats may be given to her. If a kick is made or threatened, the cow is never to be beaten for it, but spoken to kindly. No other person than the milker should approach the cow during the milking. Having entirely cured some cows that had been in the habit of kicking badly, by this treatment, wholly dispensing with sticks and ropes and other arrangements to prevent the kicking, and which only irritate the cow, I have confidence that there are few cows that have been so utterly spoiled that they may not yet be made quite gentle by it.

Some cows kick because their sight is defective and they cannot distinguish the person approaching them. I have one such cow that is perfectly gentle and kind and free from all vice of whatever kind, that will yet lash out the foot when she is approached from behind without being spoken to, and especially when the udder is touched on the wrong side suddenly and without notice. Nevertheless, when spoken to she will turn her head and lick the hand which is stretched out to her. This cow's sight is not good, and the defect is shown in other ways. Such cows should be approached and handled always with gentleness, or they may be very easily startled, when it is instinctive with them to kick.

Holding up the milk occurs chiefly when the cow is fresh. A cow that has been used to suckle her calf will naturally prefer that way of being milked. It is most frequent with cows that are so habituated, and for this reason it is rare among those cows whose calves are not permitted to suck them. It is a fault more easily prevented than cured, and at the same time one that is very troublesome and mischievous in its results. A fresh cow that holds up her milk nearly always provokes thereby an attack of garget and future loss of milk all through the season, so that the dairyman or owner of a family cow should be on the watch to avert the trouble. When the calf is habitually taken from the cow before it has had time to suck, the cow will come to her milk naturally and without resistance, and this practice cannot be too strongly recommended as a constant rule in the dairy. When, however, the trouble has occurred and a remedy is sought, we find how powerless we are to strive with the natural instincts of an animal excited to stubborn resistance. Many devices have been tried and recommended to overcome this vicious propensity, but none of them is of much value. One of these is to hang a heavy chain across the loins; another is to press upon the loins forcibly with the hands while efforts are being made to draw the milk. Others are to give some feed at milking time, or to distract in some way the attention of the cow from her supposed grievance. Soothing measures and perseverance, or the use of milking tubes, are the only effective remedies. To give some feed or salt, and to sit down and rub the udder and manipulate the teats as in milking, and to persevere with gentleness, is often effective; but the only successful method of getting the milk is by the use of milking tubes (to be more particularly described hereafter), by which the milk flows by force of gravity in spite of any unwillingness of the cow. The tubes are inserted gently into the teats and the milk runs in a stream until all is drawn off. This method, or any other, is only temporary, and to be used only in the special emergency, because of the danger of injuring the lining membranes of the teats and producing inflammation of the udder.

Self-sucking is the worst vice which a cow can contract. It totally destroys her usefulness and is a constant irritation and disappointment. It is contracted by old cows as well as by young ones, and cases occur in which 10 or 12-year-old animals begin to practice the vice. How it is learned seems to be unknown; but it is more frequent than might be suspected. The remedies proposed have been numerous, but all fail excepting that of slitting the tongue, by which the act of suction is made impossible. It may seem that this is a cruel and unusual punishment, but it is not so severe an operation as castration, and we do not hesitate at that to increase the value of our male animals. The use of the "nose jewel," which is a piece of board fastened to the nostrils so as to hang over the muzzle, and of variously arranged pokes, neck bracelets and straps, has been recommended as sure cures, but all have failed in practice. I do not hesitate to recommend the operation of slitting the tongue when the cow is a valuable one, the division being made two inches in length. The operation should be performed when the cow is dry, and the wound heals very soon. It is necessary to give soft food or slop until the healing is well advanced.

Entomological.

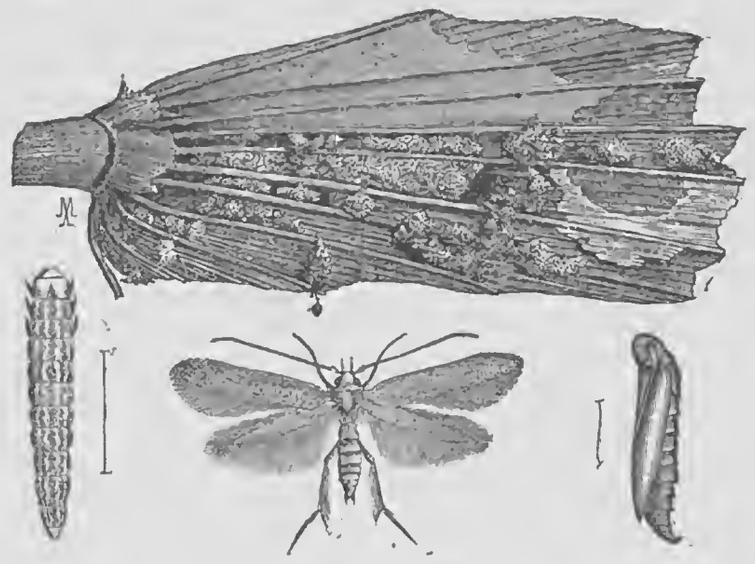
THE PALMETTO-LEAF MINER.
(Laverna Sabalella.)

The saw-palmetto (Sabal serrulata) on whose leaves the leaf-miner lives, is found in the sandy wastes of South Carolina and southward, and, as yet, it is of but little use in manufacture, so that any insect infesting it can scarcely be called injurious in the sense that we use the term in applying it to such insects as the cotton-worm. However, a study of its nature, habits andcharacteristics is interesting.

According to the report of the Entomologist to the Department of Agriculture, for 1879-80, the larva feeds only on the upper surface of the palmetto leaf, leaving the lower surface or skin unharmed. Reference to the Illustration, Fig. 420, will show the manner in which the larvæ proceed in their work on the leaf, and also the nests which they occupy when eating. These nests are delicate sheets of silk, covered with excrementitious pellets of the larvæ, the mass resembling a collection of particles of sawdust. These little masses entirely cover that portion of the leaf on which the larvæ are immediately engaged; hence the true nature of their work is concealed. The larvæ are about half an inch in length, white in color, tinged with yellow, the head and mandibles a yellowish-brown. They are active in their movements, and, if disturbed, they can quickly spin out a silken thread by which they descend to the ground. Alcohol will change their color to a brilliant pink or rose. Inside the nest the chrysalis is formed, which is about three-fifteenths of an inch in length, the color reddish to reddish-brown. It is represented on the right of the engraving, the larva on the left. In the center the moth is shown, which is of a silver-gray color, with a slight tinge of lavender in some cases. The front wings bear two small, black spots, each near the hind margin. These insects have sometimes been found on the young Cabbage Palmetto; but they are generally found on the species above mentioned.

A New Clover Enemy!—The Supposed Army Worm.

Prof. Riley called at this office on his way to attend the Scientific Ag. Association at Cincinnati and Am. Asso. Ad. Sc., of which he is General Secretary. He will spend some time on the way in Yates County, N.Y., looking into a recently reported injury to clover by a large snout-beetle (Phytonomus punctulatus), which has never been found in this country before, and which is apparently an importation from Europe. He states that he has recently reared the smaller worm which did so much injury to the grass in the dairy counties of this State in June, and was at first looked upon as the Army worm. It proves to be a common moth (Crambus vulgivagellus), belonging to a genus which, in the larva state, is partial to grass.



PALMETTO LEAF MINER—FIG. 420.

The Vineyard.

THE NEW WHITE GRAPES.

At a recent meeting of our Western New York Horticultural Society, this question was asked: "Is there any hybrid grape that can be recommended for general vineyard (field) culture in Western New York?" The replies were to the effect that while there were many that were very desirable for the garden, no hybrid could safely be planted extensively in the field. The Lady Washington Grape is superior to Pocklington or Niagara in quality and beauty, but as it is a hybrid, and as the other two are natives, I should be tempted to offset the demerit of foreign blood against the merits of superior quality and beauty. I am glad to learn from Mr. Bensel that the public is becoming more discriminating in regard to the quality of fruits, but the facts in the premises incline me to the belief that, while we can see some slight change for the better in New York, Boston and Philadelphia, the present race of fruit growers will have departed from this life long before the masses will pay twice the price of Concord for Catawbas. But if they did pay twice the price, still the Concord would be the more profitable in New York State at large, for there are only a few favored sections where the Catawba can be grown successfully.

I have a high opinion of the Lady Washington. With slight protection it wintered without the loss of a bud with me. At Rochester W. C. Barry tells me it was injured as it hung on the trellis, but last Winter was exceptional, and I infer from the RURAL's report that the Niagara was more or less injured at the Rural Grounds, though it does not say so. [The Niagara at the Rural Farm, on the ocean, was not harmed in the least. The Lady Washington at the Rural Grounds, Bergen Co., New Jersey, (in a valley) was killed nearly to the ground. Eds.] Lady Washington is pre-eminently vigorous and productive here, and thus far perfectly healthy. The clusters are very large and often double-shouldered. Should it prove hardy and healthy enough for vineyard planting in Western New York, it will exceed our present expectations of hybrids, yet it may prove an exception, and I sincerely hope it may. There is a vast difference in tastes respecting the quality of fruits. What is one man's meat is another's poison. As highly as I respect the opinions of our pomological authorities, I cannot but think it best that individuals should express their own opinions as to quality, otherwise we shall be led into error. It is altogether too common at the present day for writers to express opinions that are simply reflected; if an authority says a grape or a strawberry is of ordinary or poor quality, such writers dare not risk their reputation by giving a contrary report, whereas in their peculiar locality the quality may be vastly different, and the difference plainly perceptible to them. Geo. W. Campbell thought his Triumph Grape wanting in character at Delaware, Ohio; but in Missouri, George Husmann, Samuel Miller, and others think it one of the most attractive table grapes they have. The Crystal City Strawberry is reported by good authorities as of poor quality, but here it is delicious, though faulty in other respects.

Clifton, N. Y. CHAS. A. GREEN.

Vitis Arizonica and Vitis Californica.

Seed of these two classes of grapes was kindly sent me by the Commissioner of Agriculture. I sowed it in a common hot-bed with seed of Iona and Eumelan: all were cared for alike. Result: the young plants of Arizonica and Californica are nearly all dead, or so badly mildewed that I fear I cannot save them. The Iona plants are mildewed to some extent; the plants from the Eumelan are apparently free from the mildew, but making a slow growth. It should be stated that it has been a cold season here, and that there is more or less mildew on the old vines in the same garden. The following varieties are injured about in the order in which they are here named: Sweet Water (a foreign vine), Othello, Rogers's No. 5, Salem, Merrimac, Agawam (all hybrids with the foreign), Delaware, Iona, Adirondac and Creveling. Other varieties are not much injured. Both the leaves and young canes of Arizonica, Californica and Sweet Water are attacked; the fruit on the others suffers most, turning white, hardening, and growing darker. The fungus is perhaps Oidium Tuckeri, or a kindred variety; my glass does not magnify enough to tell me which for certain. My first thought upon observing the young plants was, that I had introduced with the seed a new fungus, but upon comparison with the old plants, I concluded it was the old enemy in an unusual form. The lesson seems to be that these new classes will not stand our Atlantic seaboard climate and that the European and its hybrids must give place to our more robust classes, their hybrids and varieties. D. S. MARVIN.

Jefferson Co., N. Y.

Industrial Topics.

RAISING CARP.

In answer to an inquiry, we have received the following communication from the head of the United States Commission on Fish and Fisheries:

"The European Carp are propagated in the United States breeding ponds in Washington for distribution throughout the country. In distributing these fish, imported some few years since for the purpose of supplying to the innumerable ponds over the country a good food fish that could be readily domesticated, it has been my aim to send them to persons who have localities and conditions in which they would be likely to succeed. In order to enable me to do this, I have solicited the advice of the Members of Congress, as being more familiar with the capabilities and surroundings of their constituents than any others to whom I could apply, and have based the issues of the fish on their indorsements.

The only conditions of the distribution are that the small fish issued shall be properly cared for, *i. e.*, placed in water likely to be suitable for their maintenance, and which are not filled with other fish. The number given to an individual is, of course, governed by the supply. This, the first season, was limited to 16, but the increased production of last year enabled me to furnish from 20 to 25 to each applicant. To persons in the adjacent States the issue is made from the breeding ponds in Washington; but for those in the more remote ones central localities are selected as points of distribution to which the fish are transferred from Washington free of cost to the applicants, who are required either to send to the points designated or pay the cost of their reshipment.

The Express Companies have been so successful in transporting the young fish during the colder months, that I propose, the coming Winter, to send to all those persons whose applications are favorably indorsed and who are willing to meet the cost of transportation from the ponds, as many fish as can possibly be allowed them. By this arrangement those parties who are willing to pay the express charges will be enabled to receive the fish more promptly and without the risk and contingencies of a general distribution.

SPENCER F. BAIRD, Commissioner."

The carp has a small mouth, thick lips with barbels, or feelers, at the corners of the mouth. Instead of having the teeth, as usual, in the jaws, they are situated on the pharyngeal bones which are arranged in three rows leading to the gullet. The general color of the back and sides is a dark or olive-brown, the abdomen being often of a whitish-yellow or orange tint, the coloring varying somewhat with the season, water and soil, as well as with the age and food of the fish. The carp has been known for centuries in Europe, having, it is thought, been orginally imported from Persia. It has been extensively cultivated in different parts of the continent, especially

in Germany and Austria. carp cultnre in the latter country having been traced as far back as 1227. As the carp has for centnries been raised under varions conditions—in small ponds, large bodies of water, rivers, etc.,—different varieties or species have been developed. These are divided into three principal groups:—1. The scale carp, with regular concentrically-arranged scales, supposed to be the original species slightly improved 2. The mirror carp, thus named on account of the extraordinarily large scales which run along the sides of the body, the rest of it being bare. 3. The leather carp, which has on the back either only a few scales or none at all, and possesses a thick, soft skin which feels velvety to the touch. The two last named have a somewhat stouter and shorter but more fleshy body than the first. The leather carp, whether old or young, bears transportation and other hardships the best. Each kind is prized most in one or other district in Europe; but here the leather carp is generally esteemed most highly.

The increase of the carp is extremely rapid nnder favorable conditions of location, food and protection from enemies. In Angnst 1872 the late Mr. J. A. Coppe, out of eighty-three carp of various sizes he had shipped from Germany, succeeded in transporting alive five of the smallest, about the size of a steel pen, to his farm in Sonoma Co., California, where they were placed in a pond previonsly prepared for them. In the following May they had grown to sixteen inches in length, and the yonng fish had increased to over 3,000. Since that time the increase has been equally rapid, but overstocking has been prevented by large sales to other persons anxious to raise carp. The spawning season lasts from May until August according to the latitude, though most of it takes place in May and June. The nnmber of eggs in each fish is enormons, one weighing five pounds containing from four to five thonsand. The eggs are agglomerated, not detached, and adhere in lnmps to aquatic plants, stones or brnsh-wood, and in this position they can be readily removed from one pond to another. In stocking ponds three females should be put in for two males.

As older carp feed on the spawn, the place where this rests should be either partitioned off from them or so shallow that they cannot get to it. Other fish, too, devonr this as well as the young carp, and should, therefore, never be admitted into a carp pond. This rule should be especially enforced against the voracious pike. In addition to whatever food they may find in their habitation, a good feed for the young fish consists of one-fourth corn meal and three-fonrths flour, mixed into a paste and scattered here and there in the pond in order to force them to seek it, as the carp, probably throngh its long maintenance in a state of semi-domestication, is one of the laziest fishes that swim, when food is plentiful without the need of exertion. The carp is very easily satisfied in the way of food. It feeds on almost all sorts of aquatic plants, snch as the ordinary pond weeds, splatter docks, pickerel-weed. arrow-head, pond-lilies, duck-weed, wild rice, etc., etc., as well as npon garden vegetables, barley, wheat, corn, peas, coagnlated blood, curd, worms, larvæ of aqnatic insects, kitchen refuse, slaughter-honse offal, refuse of breweries and even excrements of cattle and pigs. Indeed there are very few kinds of food on which a carp will not thrive, though, of course, it does better on some than on others. Food should be given only early in the morning or evening so that the fish may search for food during the day.

As cold weather approaches, generally in late October or early November in northern latitndes, the fish seek the deepest waters to hibernate in groups of from 50 to 100 and more. In the muddy bottom they make a cavity called a "kettle," in which they pass the Winter, huddled together in concentric circles with heads close to each other, the posterior part of the body raised and held immovable, scarcely lifting the gills to breathe and without a particle of food. In cold climates this fast lasts from the beginning of October to the end of March, the period decreasing as the temperature grows milder on the way south. As the fish do not grow at all during this hibernation, they increase all the more rapidly the farther south their habitation, as they have then a longer time each year to feed and grow fat. When they are transported for propagation in Spring or Winter, however, they arrive at their destination worn and hnngry, and should be placed in a tank where they should be fed a little. For this purpose a good mixture is boiled barley or rye flonr made into a paste with hot water and mixed with a little loam or dry bread. Carp grow only in May, June, July and August, remaining apparently stationary throughout the rest of the year—at least in the more northern latitudes, thongh in Sicily it is found their period of growth is considerably longer.

In warm, shallow water the embryo fish breaks from its shell from the twelfth to the sixteenth day, and then its growth differs according to the temperature of the water, the amount of food and the quality of the soil—whether muddy or stony, cold water and stony ground not being favorable to its development. In three years the fish average from three to three and a quarter pounds; and if the weather has been nnnsually warm or the food very plentiful, they will weigh considerably more. The carp is known to have lived to the age of 140 years, increasing in size np to the thirty-fifth year, when it measures in length about 3½ feet by 2⅝ feet in circumference, weighing between 30 and 40 pounds, thongh some "old stagers" have been caught weighing over 75 pounds. In warm, southern climates, Professor Baird thinks there is no donbt bnt carp wonld gain a weight of two and three-qnarters to four pounds in eighteen months, while in colder climates it would reqnire two and a half years to attain this.

The carp is excellently adapted for raising in inclosed waters, such as lakelets, pools or artificial ponds, and also for stocking open waters, such as rivers, lakes, etc. A large proportion of the farms in the conntry have places which might very profitably be converted into ponds for the purpose, by the nse of an ordinary road scraper to deepen marshy ground or any natural depression which can be snpplied with water from a spring or adjacent stream. A rocky, gravelly ground is of no use; though a small pond with a sandy bottom may be rendered suitable by coating it with a thick layer of loam. Clay or loamy ground is the best for a carp pond. If it contains marl or some elements of humus, so much the better; bnt too much humns or dissolved peat is injurions. Water from bog meadows or oak wood contains too much humic acid and tannin and gives a moldy taste to the fish: so does water which it passes. The most favorable water will always be that which comes from rivers and brooks, and the snpply should be so regulated that it will always be the same hight in the pond—neither overflowing from excess of rainfall, nor sinking low from drought.

The accompanying engravings illustrate varions sorts of ponds both for carp culture and carp keeping, the former term being applied to the raising of carp for sale: the latter, to the raising of carp for the use of one's own family. In the first case at least three adjajent ponds are needed—one for the yonng fry; one for the larger or growing carp; and one for wintering the fish. On the last the success of the ventnre mainly depends: while the ponds for the yonng fry and the growing carp may be shallow, the wintering pond should be from eight to twelve feet deep and should have some flowing water even during the coldest weather. What more space permits us to say, however, must be confined to an explanation of the cuts which will explain the chief requirements in the constrnction of the ponds.

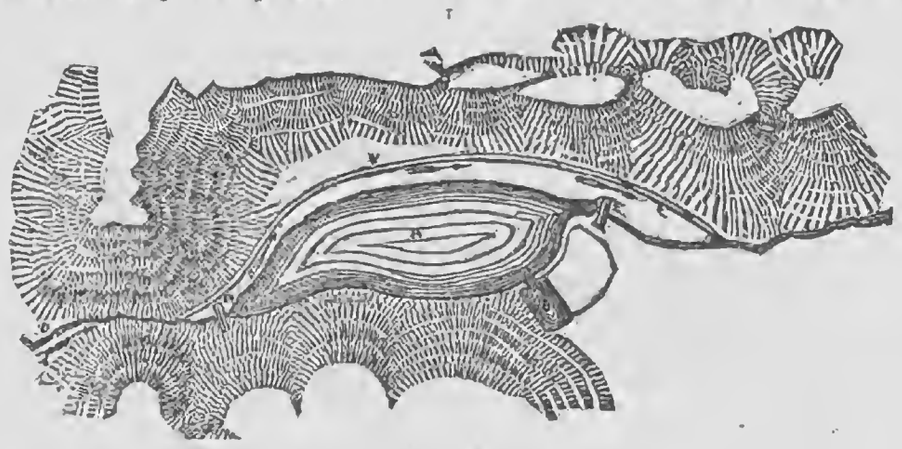


FIG. 421.

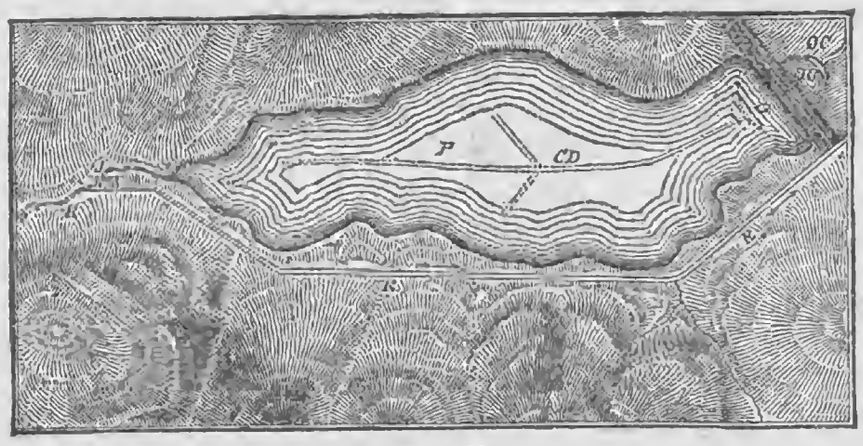

FIG. 422.

Fig. 421 A. is an ordinary farm pond for *carp keeping*. B. is a shallow cut connected with it designed as a hatching pond where the yonng fry will be safe nntil old enough to be transferred to the pond. C. is the supply stream; G. the gate that regulates the supply;

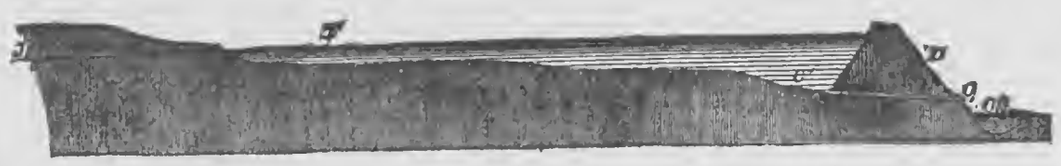

FIG. 423.

be snpplied with water from a spring or adjacent stream. A rocky, gravelly ground is of no use; though a small pond with a sandy bottom may be rendered suitable by coating it with a thick layer of loam. Clay or loamy ground is the best for a carp pond. If it contains marl or some elements of humus, so much the better; bnt too much humns or dissolved peat is injurions. Water from bog meadows or oak wood contains too much humic acid and tannin and gives a moldy taste to the fish: so does water collected from rainfalls. Too mnch carbonate or snlphate of lime is also injnrions, and water from mineral springs shonld never be admitted, while that from ordinary springs should be condncted to the pond through narrow, shallow ditches so as to become warmed up and hold in solution some of the soil over which it passes. E. that which regnlates the discharge; F. F. the stream condncted *around* the pond instead of allowing it to pass through it—a mnch better plan.

FIG. 423.—Pond *P* is a natural body of water formed by a dam, *D*, abont seven to eight feet high, crossing a valley and thus collecting the water of a rnn flowing there. Before *D* is a deepening, *C*, the collector, for gathering the fish previous to scooping them ont. In the dam *D* there is an outlet leading to another deepening—the so-called outlet collector *O C*.

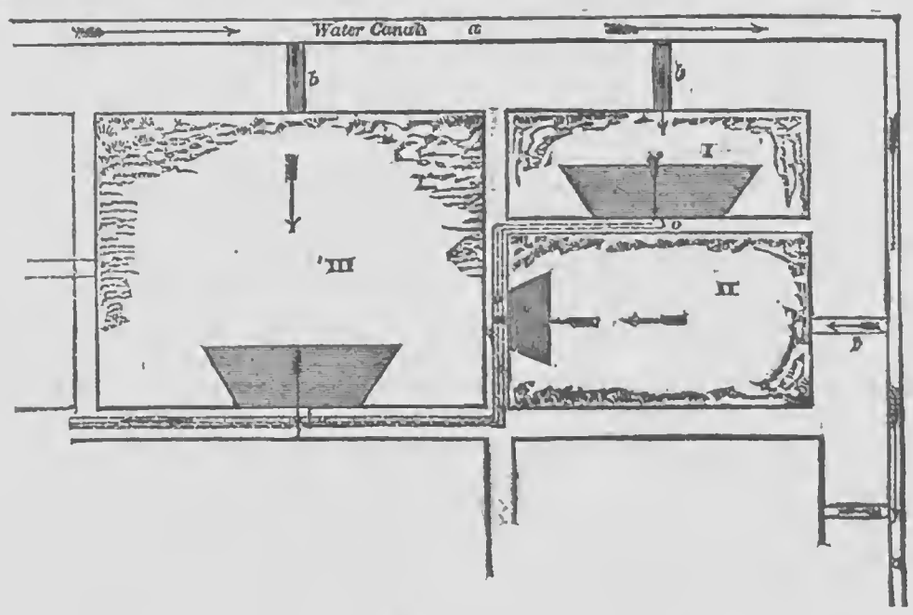

FIG. 424.

The purpose of this collector is to keep back fishes that may have passed the ontlet when opened. It is provided with a screen or netting, *C D*. Upon the bottom of pond *P*, is the collector-ditch, which conducts the fishes to *C* when the water is let out, and thus prevents their being caught in the mnd. *R* is the run of water which, to prevent overflow, has to be conducted arnnd the pond in a separate ditch, leaving an inlet at *I*, protected by a sluice with screens.

Fig. 423. F, snrface of the pond; C, collector; D, dam; O, outlet through a tile drain to be blocked up except when the pond is to be drained in order to catch the fish: OK, outlet collector; J, inlet. Here, too, the stream is conducted arnnd the pond.

Fig. 424 shows a grouping of three ponds for carp culture, all snpplied by one stream; I, breeding-pond for spawning fishes and spawn; II, pond for small fry; III, pond for large fish; *a*, supply of water; *b*, inlet; *c*, collector for gathering fish; *o*, ontlet.

In all farm carp ponds there shonld be a depression, preferably in the middle, large enongh to permit all the fish to hibernate in it, and deep enough to prevent the water in it from freeziug to the bottom in the coldest winter nights, thns causing the death of the fish. How deep this shonld be will depend on the exposnre of the pond, its surroundings and latitnde.

Pomological.

PEAR BLIGHT.

It is a common idea that when a pear tree is strnck with the blight, it never recovers. The disease is regarded very mnch as consnmption in the case of a hnman being—sometimes slow bnt always snre death. This idea has no foundation in fact. I can see from my window a tree that was badly affected with blight ten years ago, but which is now a healthy tree. Snch examples are plentiful. The object of this article is to try to impress npon the minds of the owners of pear trees the neccssity of keeping constant watch of the trees at this time of year. As soon as the blight appears, there should not be an hour lost before the part affected is removed. If this is done soon enough in most cases the tree will be saved. The blighted limbs should be cut off below where blight is visible. Whatever is the nature of this blight the poison appears to work downward, and consequently the germs of the disease exist below where the blight is visible; if the limb is promptly removed there is no more danger of that tree than any other. The danger consists in allowing the blighted part to remain until the poison has extended so far as to endanger the life of the tree. During the last year important observations have been made with the aid of powerful microscopes to ascertain the true character of this disease. These efforts I think have been perfectly successful. There is no longer any reasonable doubt of the trne cause of pear blight. Onr only concern here is abont the remedy. Prompt removal is the only remedy we know of at present. My advice is, let this be qnickly and thoroughly done. A. M. Williams.

Another Early Peach—Fredenburg.

It has been made evident to me by my experience of to-day that the limit of earliness, in addition to size and quality, has not yet been reached in the peach. I had heard of an early peach at Kingston in the neighboring county of Ulster and one of the local papers attempted to describe it, but this was done in such an incomplete manner that I resolved to make an examination. Mr. Fredenberg, a respectable and successful businessman of the city, received me very cordially, bnt Mrs. F., who has the principal care of their frnit and flower garden, and who planted the pit of this new variety, was unfortunately not at home. Yet I saw the peach tree and ate of the fruit, which is of the largest size for a peach ripening in this latitude on the 25th of July. I have little doubt, from its general appearance, that this new seedling is from the Alexander, the constitution of that class being so strong that it continues to reproduce from the pit. It is a most beautiful frnit, and may prove valnable for the peach region of the Hndson River. The leaf is without glands and finely serrated; blossoms large. A. A. B.

Newburgh N. Y., Ang. 4.

Miscellaneous.

VARIOUS TOPICS.

That excellent early dessert pear, the Doyenné d'Eté, has with me prodnced an immense crop of frnit this season, and ripened it in an excellent condition. I do not think this pear is as extensively cultivated as its merits entitle it to be, and why it is not more generally planted is more than I can say. The tree is of vigorons, healthy growth and is also remarkably productive. The fruit is of small

size, juicy and of a remarkably sweet, pleasant flavor. It is also very attractive in appearance, the skin being of a fine yellow color beautifully marked and shaded with red. As this variety ripens about the first of August, when fruit is not very abundant, a dozen trees should be found in every suburban garden. Indeed every farmer should have at least several trees. I think that if farmers could only be shown a plate of the fruit of this variety they would need no further inducement to give it at least a trial. The size of the fruit can be improved to a considerable extent by judicious thinning when about half grown. As before said, it ripens about the first of August, so it is a few days later than the Madeleine or Citron de Carmes, which ripens about the 25th of July. Of this variety I happen to possess one fair-sized tree from which I obtained about three pecks of very fair fruit. It is of vigorous, erect growth, bearing medium-sized, obovate fruit which gradually tapers towards the stalk. When properly ripened, the fruit is juicy and of a pale yellowish-green color. It is not a very long keeping variety, and should be picked, and ripened in the house. This is a pear but little grown and is only desirable on account of its being so early. Some persons think it of value, but I do not prize it very highly. In other localities it may, however, be found of more value.

In reply to "Leon" who inquires, on page 513, for information concerning the difference between Deutzia scabra and D. crenata, I do not claim my plant to be true scabra, but it is certainly different from D. crenata in its more erect growth and its much narrower, rougher leaves. It has been here for many years and I regret I do not know from whom it was obtained. I shall have either to remove or destroy it this Fall, as it is in the way of other shrubs. I am aware that D scabra is a scarce shrub, but for ornamental decoration of our lawns, D crenata will prove to be of as much value as D scabra.

Will "Agrostis" who wrote the article on R sa rugosa, page 481 of the RURAL for July 28 please be so good as to send me a postal card through the RURAL Office and let me know the name of the person who has the large bush of this rose. I am interested in its history, as I have a large plant that was raised from seed brought from Japan by the Commodore Perry Expedition I think that it is an error as to its being grown some 70 years ago; but I may be mistaken; however I should be pleased to hear from "Agrostis."

The Morality of Wine Production.

So far as our experience has gone, it appears that our fertile hills, with excellent natural drainage and a genial climate, are admirably adapted to grape growing for wine making. The grave question that confronts conscientious people is, "If wine making should be developed into a great industry, would its tendencies be evil by inducing intemperance." Prof. George Husmann says, (American Grape Growing and Wine Making, p 235). "I have always looked upon the general use of pure, light wine as the best temperance measure that could be adopted." That the substitution of pure wine for whiskey and brandy as a common beverage would be an improvement I have not a doubt; but this leaves untouched the question of the intrinsic evil tendencies of wine making Therefore if through the RURAL an expression should be given to the matnre conclusions of the most able persons who have studied this phase of the question, together with any statistics showing the intemperance of wine-producing countries as compared with that of others, it would turn attention to an important subject, of even more interest to agriculturists than to the rest of the community.

BOOKS, CATALOGUES, ETC.

THOMAS MEEHAN, Germantown Nurseries, Philadelphia, Pa.—Catalogue of all sorts of forest and ornamental trees—deciduous and evergreen—vines, fruits, hedge plants, ferns, plants and bulbs—also seeds of many of the above. Sent free to subscribers who apply to Mr. Meehan.

QUARTERLY REPORT of the Kansas State Board of Agriculture for the quarter ending June 30—containing reports as to condition of winter wheat, rye, farm animals, etc., together with special papers collating the practical experience of growers of broom corn, castor beans, flax and hemp throughout Kansas, etc, etc J K Hudson is the Secretary (Topeka) and he is one of those secretaries that the agricultural community of Kansas should prize.

NASH & BROTHER, 22 College Place New York City. Illustrated catalogue of the Acme Pulverizing Harrow, Clod Crusher and Leveler. Sent free. This, as we know from several years' use, is an excellent implement.

F. R. PIERSON, Tarrytown, N. Y. Pot-grown strawberries and other small fruits for Fall planting. A specialty of the Sharpless and Manchester. Gratuitously distributed. Apply to Mr. Pierson.

What Others Say

FLAX CULTURE IN KANSAS.—From the last quarterly report of the Kansas State Board of Agriculture, we take the following respecting the culture of flax in that State. We wish that some of our many Kansas subscribers would write us their experience as to this important crop. The soil here (Monrovia Co) is a deep, black loam, containing a large percentage of sand, and seems well adapted to flax culture. The ground should be well plowed, and then harrowed until thoroughly pulverized. Drilling and sowing broadcast have proved about equally successful in my experience, but as a rule I favor drilling, for many persons who cannot successfully sow broadcast can use a drill without difficulty. After sowing, I go over the ground with a heavy, wooden roller, to smooth and pack the soil, and crush any clods, as one of the secrets of success with flax is to have the soil in proper tilth. The proper quantity of seed is about three pecks per acre, or perhaps a trifle less. When the bolls assume a brown color, it is ready to cut, notwithstanding the leaves and stalks may still be green; at that stage of ripeness it will shatter and waste less than when ripe. I cut with an improved Buckeye table-rake machine, but any other good self-raker will answer as well. Left on the ground as dropped by the machine, it will in four or five days of good weather be cured enough to thrash at once or to stack. The curing can be very much expedited by turning the gavels over, two or three days after cutting; this I have found desirable. My crops average about 11 bushels per acre, though in exceptional cases the yield has been 16 or 18 bushels. Have usually marketed, in October or November, for 98 cents to $1 05 per bushel. The straw I carefully stack at thrashing-time, and in Winter cattle and horses eat it greedily, in preference to any kind of hay, which I think it equals in value. The yield of straw per acre will not exceed one-half ton. In preparing for the ensuing crop I fall-plow the ground. A flax crop leaves the land in excellent condition for Fall wheat, or if fall-plowed is in readiness for corn in the Spring, either making a very desirable rotation. The cost of preparing the ground and sowing flax is about the same as for wheat; the cost of seed this Spring was about $1 per acre, or considerably less than wheat; the cost of harvesting is about 75 cents, or perhaps less than half the expense of wheat; to thrash flax costs eight to ten cents per bushel, and wheat four cents, which will equalize the difference in cost of seed. The entire total expense of handling a crop of flax is 30 to 40 per cent. less per acre than wheat. It has demonstrated that flax is one of the most profitable productions of this part of the State, and it is no longer an experiment.

CASTOR BEAN CULTURE.—From the same source we take the following as to castor bean culture. I have raised castor beans in Cowley four years; they will do well on any soil suitable for wheat. Prepare the ground as for corn, and if light soil, make rows four feet apart; if rich soil, five feet apart. Aim to have one stalk in a hill, requiring about one quart of seed per acre. Prefer the large gray variety. As soon as ripening begins I commence harvesting, and go over the field once a week. Have a narrow one-horse cart to gather in. Have a dirt floor to snap them on, and clean them with fanning-mill having a bean riddle. On light sod land I obtain seven to ten bushels; on light old land, 12 to 15 bushels, and on rich bottom land as high as 35 bushels per acre. Prices have averaged a little more than $1 per bushel. Raising castor beans enriches the soil and leaves it in most excellent condition for a corn crop. My stock has always had access to my beans, without loss so far. The stalks I drag down with a harrow, and they can be readily plowed under. The cost of production per acre is about the same as that of corn.

BROOM CULTURE.—As to the cultivation of Broom Corn another correspondent says:—I have raised Broom Corn in this State, Chase County, seven years, and found it a profitable crop. Any soil that will raise corn will produce a good crop of brush. Prepare the ground as for corn, and have it clean. Plant with drill, one-quarter of a bushel of seed per acre. I use the Improved Evergreen variety. Begin to table and cut as soon as the bloom commences to fall. To make a table, break two rows diagonally across each other, about three feet from the ground; cut the stalks four to six inches from brush, as fast as they are broken, and throw in bunches on the table, upon which four rows may be placed. One man can break as fast as three can cut. When a load of brush is cut the hauling should begin and no time be lost in cleaning and putting under shed to dry. It may be cut wet or dry if cleaned and properly scaffolded. Broom Corn should never be fully ripe when cut, except for seed. Any kind of a good two-horse power, with a cylinder, makes a good seeder. On fair land, with good cultivation, from 500 to 700 pounds of brush can be raised per acre. It is not the largest brush that is the most salable, consequently it should not be planted too wide in the row. My corn is all made up for home trade. The stalks are of no more value than those of the sunflowers. Tabling, cutting, seeding and drying should be done at one time.

BETTER CARE FOR STOCK THAN FAMILY.—There is truth in the following from the New York Sun: We might name, says the writer, some of the richest farmers in the richest agricultural regions of this country who provide magnificent barns, stables, sheds, and pastures for their animals, but at the same time keep their wives and children in mean and uncomfortable houses, with few conveniences for doing their work easily and properly. Shade trees are left or planted in the pastures for their stock to recline under, but there is not one near the house, while as for flowers and ornamental plants, a whiff from some fragrant old lilac or syringa is about all the garden perfume which reaches the inside of thousands of country homes.

FLOWERS IN FARM-HOUSES.—It is simply a low, vulgar taste or relic of barbarism, the article states in another part, that excludes the the flower garden from too many country homes, and we are further compelled to say that in a majority of instances it is the men of the family, and not the women, who are the barbarians. Go where we will in the United States, the flower pots in the window, the vine over the door or porch, the little bed of Sweet Williams or humble verbena in the front yard are almost infallible signs that there is a woman about, with taste and love for the beautiful in nature; and, although circumstances may not be favorable for developing her ideas in such matters, still the taste and desire are there, and she is a better woman for entertaining them.

HEREFORDS IN THE UNITED STATES.—Speaking of the demand for Herefords in this country, T. C Jones, writing to the London Live Stock Journal, says that it is to be observed, in the first place, that it is of recent origin, and it cannot be predicted what the future of the business will be, or whether the Hereford calves will be so well adapted to the hardships and privations of our wild ranges as is now anticipated. The Hereford breed, like other approved breeds of British cattle, has been much improved of late years, and will not endure the hardships it was accustomed to undergo in some quarters fifty or a hundred years ago; and it is not likely it will prove more profitable than crosses of the Short-horn breed under a system which allows a large percentage of the unimproved cattle of the plains to perish from hunger and the severity of the cold every Winter. It is, moreover, believed by a majority of intelligent observers that this ranch-method of producing beef—barbarous alike in its influence upon man and beast, will prove an ephemeral business. The grass in these wild and unenclosed districts is scanty, and really nutritious but a few months in the year, so that vast ranges are required—it is said, from three to five acres to graze a single sheep. The most of the varieties being annuals, the re-seeding necessary is each year of course diminished by heavy stocking; we, therefore have reports of increasing scarcity of grass in all the older districts. It is, in fact, the general opinion of men best informed in regard to the system of beef production, that it has already reached its maximum.

FLOWERING TREES.—Mr. W. C. Barry, of the Mount Hope Nurseries, Rochester, N. Y., in his essay read before the American Association of Nurserymen (Dayton, Ohio, June 17), refers to some trees which are desirable on account of their attractive flowers as well as for their foliage. First he names the Yellow Wood, which undoubtedly is the finest flowering tree we have. Its long, white racemes of pure white flowers hang gracefully about the tree and form a picture, the admirable points of which it is difficult to describe.

The Chinese Magnolias are so well known that he refers to them only in a general way. The Judas Tree may be associated with them in groups with fine results.

The large Double-flowering Cherry, White-flowering Dogwood, Double Scarlet and Double White Thorns, White Fringe, and the lindens, are all admirable trees, and merit prominent places in ornamental grounds.

The Double-flowering Horse-chestnut is justly admired for its elegant form and magnificent inflorescence. The absence of fruit, by which much litter is avoided, is an important argument in favor of its employment.

The Red-flowering Horse-chestnut is surpassed by few ornamental trees.

Koelreuteria paniculata, with its golden yellow flowers, and Catalpa syringæfolia, producing great clusters of white and purple flowers, cannot be too highly prized, as they blossom at a season when flowers are very scarce.

The double-flowering peaches, which flower immediately after the Prunus triloba and Dwarf Double-flowering Almond are very desirable. One variety produces double rose flowers, another double white, and another double red. At the flowering season every branch of these trees is thickly studded with blooms, which are remarkable for their size, beauty, and the length of time they remain fresh. The three are a trio of flowering trees which deserve to be extensively planted.

The Scarlet Maple yields a profusion of flowers early in Spring, before the leaves appear. It is very showy and ornamental.

It is very strange, Mr. Barry remarks, that gentlemen who have spent thousands upon a house would be willing to sacrifice beautiful grounds by careless planting. The same attention and care which are bestowed upon the house should be devoted to the garden, in order that the house and its surroundings may present one harmonious whole. Another common error is that of planting trees which attain large size, in small lots. A tall elm or Norway Spruce, or other large tree, is very much out of place on a small lawn.

SINCE the introduction of the lawn mower the lawn has come to be regarded as the great feature of a garden. When it is well kept there is nothing more beautiful or pleasing than a broad, open space of turf, and in the planting and arranging of trees it should be our endeavor to keep the lawn as open as possible. This can be accomplished by arranging the trees and shrubs in borders or belts around the margin, with a fine specimen tree occasionally standing alone in a prominent position, where its beauties can be seen to the best advantage.

THE ONION MAGGOT.—A writer says, in Vick's Magazine, that a neighbor and he each secured an ounce of Danvers Yellow Onion, and prepared the ground and sowed the seed in the same manner, with one exception—the neighbor covered the bed with a good supply of coal ashes. The crop in both cases came up and looked well until the plants were about six inches high, when the onions without ashes became infested with the onion maggot, and in a short time wholly disappeared. The neighbor never lost an onion. The gardens were adjoining, the beds being less than 100 feet apart.

SHALLOW CULTURE OF CORN.—We are pleased to see that recent experiments made by Mr. J. J. Thomas, the horticultural editor of the Albany Cultivator and Country Gentleman, as to how far the roots of the corn plant extend at various stages of its growth, may be offered in support of our advocacy of shallow cultivation and the injudiciousness of hilling up to any considerable extent. He says that in Summer, before the corn plants were six inches high, they were found to have horizontal roots in some instances a foot in length, making a circle of fibers two feet in diameter, or four times the hight of the plants. When the corn had reached 12 or 15 inches the roots had met between the three-feet rows, and while yet the plants had not attained more than one-tenth of their final weight or bulk. Long before the ears form, the entire ground between the rows is occupied with long and slender fibers.

A HORSE POISONED BY EATING OLEANDER.—By reference to the RURAL NEW-YORKER of 1877 it will be seen that we warned our readers against the oleander as being deadly poisonous, and though beautiful in flower and leaf as a house plant, yet it ought never to be permitted to grow where children may touch it. The following is going the rounds of the press without credit:—Prof. James Law writes: "A case that occurred recently under my notice may be recorded as a warning of the dangerous qualities of a favorite house plant. A fine, healthy mare ate a single tuft of leaves from a branch of an oleander temporarily set by the door; then went on a journey of six miles, appearing playful and well, but on returning refused her feed. Next morning she still refused to eat, looked dull and haggard, and had partially lost control of her hind limbs. The mare died before assistance could be obtained, and on opening the body the dark-red congested stomach showed the action of an acrid poison, and inquiry brought the account of the cropping of the oleander, of the injurious qualities of which the owner was entirely ignorant. As this ignorance is very widespread it may be well to say that all parts of the plant are deadly. A very small quantity of the leaves is fatal to the horse, as we have just seen. The flowers have produced death in those who carelessly picked and ate them. The branches, divested of their bark and used as skewers, have poisoned the meat roasted on them, and killed seven of the twelve people who partook of it.

MR. VICK reminds his readers that the "White Worm," or any other worm, in pots, may be destroyed by sticking three or four common matches down into the soil, also one or two up into the drain opening. The phosphorus on the match is certain death to animal life, and a powerful fertilizer for plants. . . . . A farmer relating his experience in the Husbandman, says that when he took possession of the farm he now has, there were many very large apple trees on it, and as they had no value as an orchard he cleaned them off. The brush and other waste were piled about the stumps and burned to prevent sprouts from starting. That was ten years ago or more, but from that day to this the crops raised about those stumps are better than on other portions of the field—the effect of the ashes he supposes. We have more than once observed the same effects from similiar causes and have heard several farmers say the same thing. . . . . It is pleasant to find the carnation, and its near allies, the pink and the picotee, says the London Chronicle, keeping their hold on the sometimes fickle taste of the public. For variety, purity and delicacy of color, symmetry of form, freedom of bloom, and in many cases rich fragrance, there are not many garden flowers that surpass them; and then they are in a sense everybody's flowers. But we think that this delightful class of flowers has never been fairly appreciated here in America, and we hope the RURAL's last distribution will greatly aid to change this. We should feel obliged if our readers would send us any specimens from the RURAL seed, which they deem specially handsome. . . . . "Not here?" said the man from the County Court, "where's he gone to?" "I can't say: he's dead." . . . . . De wire grass lubs a lazy nigger. . . . . Twelve er clock nebber is in a hurry. . . . . Nebber depend too much on de blackberry blossoms—Aphorisms in Scribner. . . . . It is the young city clerk who draws a week's salary in advance, and remains at a country resort over Sunday, who acts as if he owned the whole establishment and all its surroundings. . . . . Louisville Courier-Journal:—"Public school play-grounds and the streets would demoralize little angels, much less little boys." . . . . . "Is there *anything* fit to eat?" asks the N. Y. Herald. . . . . We can't all think alike. The horse thinks one thing and the man who rides him thinks another. The rider thinks it is easy to get over the road in that way, but the horse differs from him. . . . . Lavater said, what it will do us no harm to ponder upon, that he who purposely cheats his friend would cheat his God if he could. . . . . There is many a man who threatens to cut off his son with a shilling who would have to borrow the money in order to accomplish the threat. . . . . It is very easy to believe that we are in every way equal to those who are above us and very hard to believe that those below us are in any way equal to us. . . . . A practical farmer says that he always applies manure as a top-dressing for a wheat crop, and derives double the benefit from it used in that way. The growing season for wheat in the Fall being a short one, it is advisable to apply the manure in such a way that its effect will be immediate. It should be finely pulverized, says the N. Y. Herald. . . . . Mr. Purdy, in his Fruit Recorder, reminds his readers that this is the time to layer grapes to get good roots for setting next Spring. Bend down the joints of new growth into a trench and fasten them with little crotched sticks. . . . . One cane of six to eight feet in length will make three or four layers, by laying in the soil near the old plant and then out and over a small stone and then in again, and so on to end of cane.

Everywhere.

RURAL SPECIAL REPORTS.

Maryland.

FLOYD, Garrett Co., Aug. 8.—The R. B. Sorghum came up first-rate. It now has from 15 to 26 branches from each seed. The Washington Oats have done splendidly. They grew five feet high and the heads are 14 inches long. The flower seeds came up finely and are now the most beautiful I ever saw. I had bad luck with the White Elephant Potato—the bugs ate it up so completely that I shall hardly be able to save seed. The asparagus seeds I shall try next year. I hadn't a fair chance with the seeds this year, for I had just begun to clear up a farm right in the woods and the land did not yield as well as it will in the course of a few years. Still I have corn 18 feet high that is earing first-rate. All crops are tolerably good in this section. A. R.

Michigan.

HOWELL'S, Livingstone Co., August 15.—On April 23 I planted one White Elephant Potato cut into eleven pieces; it yielded half a bushel. One Early Rose cut into eleven pieces, yielded not quite a quarter of a peck. Two Snowflakes cut into eleven pieces, gave 1¼ peck. This is the first time Snowflake ever yielded more than Early Rose with me. Two tubers of Brownell's Beauty cut into eleven pieces yielded nothing—sets rotted. One Late Rose cut into eleven pieces yielded 1¼ peck. All were planted in a row, one foot apart, and received the same care, being kept free from weeds. If the W. E is as good to eat as it is to yield, it will be just the thing wanted. The W. Oats are very large—some of them six feet three inches. The R. B. Sorghum by July 10, had all grown four feet high. Then I began to cut it for feed; where cut first it is now three feet high. T P. SR.

TROWBRIDGE, Allegan Co., Aug. 7.—Of the Branching Sorghum nearly every seed came up and the plants are about four feet high, with 28 stalks in some hills. The soil is a clay loam, having a clover sod plowed under with no manure. My White Elephant weighed four ounces. I cut it into 12 pieces and planted them as you directed. We had to fight the bugs to save them; but feel well repaid. We dug a hill this morning and got three pounds and one ounce of nice, large tubers. We would not take what the RURAL cost for them alone. We did not do so well by the Washington Oats as we would like on account of sickness. They were not sowed till late, but they grew 22 large heads from one seed and five or six from almost every one; but, being late, they rusted. Our asparagus did well and looks nice. S. O. A.

New York.

RUTLAND CENTER, Jefferson Co., Aug. 10—I have 17 hills of the White Elephant Potato planted on June 5, and as they are all doing well and there are no bugs, I expect a large yield. The Washington Oats were sown in drills on the same date; the ears are well filled; but the oats are very rusty. R. B Sorghum has been doing well for the last two weeks. Hay is very good, and so are small grains. Corn, however, will not be much of a crop this year. C. L. F. K.

VERNON Oneida Co., Aug. 12—I dug to-day the White Elephant Potatoes grown from the seed received from the RURAL Free Seed Distribution last Spring. I had 49¼ pounds in actual weight. I consider this a very good yield, and they are large and fine though this is not considered a very good season for potatoes by people here on account of the want of rain. I can't say how large they would have been with plenty of water, but am pleased with the results. L. A. G.

Ohio.

SCOTT, Marion Co., Aug. 10.—In this county there is the poorest prospect for crops possible. Spring was late; the last week of March had snow from two to three feet deep, which went off slowly and made plowing late. Corn came up badly and had to be replanted. It grew slowly owing to the cold weather. Early in July we had the hottest of weather, which rolled up the corn like cigars. This lasted for two weeks; then for a week we had flooding rains, which ran the ground together hard before dry enough to plow. Harvest then came on; hence half a corn crop. Wheat was "likely" in the early Spring, but the fly, with other causes, cut it to half a crop, with inferior grain. Potatoes were first scalded, then burnt up by the hot weather; late crop, poor; early, good. At this time the weather is cool. Hay is about all in the stack. W. J. V.

Oregon.

MONUMENT, Grant Co., Aug. 12.—The agricultural resources of the country are very limited. It is chiefly a stock country and very rough—not adapted to farming. Fruit trees and small fruits do well where tried. Most vegetables do well, but the nights are rather too cold for corn. A. K.

Tennessee.

LINCOLN, Lincoln Co., Aug. 10.—We are suffering severely from drought; have had no rain of account in six weeks. Corn will be nearly a failure; cotton a scant half crop. A great deal of the millet that was sown has failed to come up on account of the drought, and what has come up will be very light. Oats were a good crop, but wheat was not so much better than last year as it promised just before harvest. W S.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

"Preserving" Crabs, etc.

F., Delaware, Wis., asks the best method of utilizing the Siberian crabs which bear fair crops of fruit this year while there is a great scarcity of choice eating apples, cherries, tame plums and blackberries. Native crabs, however, also give fair crops and so do wild plums and wild grapes, and our friend inquires whether all these will not make good jelly and how can they be best put up for next Winter.

ANS.—Of course it hardly need be remarked that Winter crabs should be carefully put away for use at maturing; and that several kinds, like Hyslop, and perhaps some of the newer ones, may be easily kept for a considerable period in the fresh state. Siberian crabs make a superior jelly: and this is so easily manufactured that almost every housewife will be familiar with the process. This would seem to afford the most ready means of utilizing much of the crop for use in the family; while our cities and villages supply an almost unlimited demand for any surplus that may be produced, if neatly and conveniently put up. For this purpose the fruit should be used when fully mature—not over-ripe, nor yet unripe, if the best results are to be attained. A few simple and cheap appliances will greatly expedite and economize the process, if it is to be conducted on an extensive scale.

Another and a very satisfactory mode of utilizing a surplus of this fruit, is in the manufacture of marmalade, which is done by removing the calices, cooking it thoroughly and forcing it through a sieve to separate the seeds, cores, stems and skin from the pulp, which is then prepared with sugar enough to prevent fermentation and put up in any convenient manner for keeping till wanted. The refuse of the crop will yield a very superior cider, whether for use as a beverage or for conversion into vinegar. The small size of nearly all the crabs constitutes a serious objection to their use for drying. There is yet another process to which this fruit is well adapted—that of canning—which, if properly done, leaves it with more of its natural flavor as well as beauty of appearance than can be retained by any other process. We fancy, moreover, that the verdict of an immense majority of the housewives of the land, has long since determined that with the modern glass, self-sealing can the summum bonum is reached, so far as the preservation of perishable fruits for home use is concerned. For this purpose the fruit should not be pared; only the calyx should be removed. The stems, which are always long and slender, may be left as a convenience, not to the purveyor only, but also to the partaker.

Breeding for Beef.

A. H. C., Beatrice, Neb., wishing to breed for beef stock, asks, 1, whether a pure-bred Hereford bull calf which its dam dropped before she was two years old, would be a suitable sire for beef stock—both have good pedigrees; 2, the breeding value of a bull calf out of a pure-bred Durham cow by a pure-bred Durham bull; the cow is a deep milker, but she looks very homely and raw-boned, and has no pedigree; 3 would it be advisable to breed heifers for beef stock as early as nine or ten months, as Mr. Stewart advises breeding them for dairy cows.

ANS.—1. Such a Hereford bull as above described would doubtless make an excellent stock animal. The precocity of the dam would be an advantage rather than a detriment. 2. The Durham (Short-horn) calf would not be a desirable animal to use for breeding for beef. The character of the dam is objectionable; it is quite probable that she may be a good dairy cow, as a good milker is apt to be raw-boned and the reverse of a beef animal in appearance. A large bull is by no means desirable for breeding purposes simply because it is large. The bull which founded the best families of Short-horns, the renowned Hubback, was a small bull. It is quality and not size that is required in a stock bull; size can always be gained by feeding. Your Hereford bull might be made of good size by good and judicious feeding, notwithstanding he is the first calf of a young heifer. 3 Mr Stewart recommends breeding dairy cows only at the age of nine or ten months, and does not refer to beef animals. He gives a good reason for it, viz., that the cows come into profit sooner. With grazing animals the case is different. Size is necessary, and the heifer should be at least two years old before she is bred. A beef animal, properly fed, will reach a good size and become mature at two years.

Plowing Under Clover.

J. B. T. W., St. Charles, Ill., asks when should he plow under a field of clover that was seeded in the Spring of '80 and from which he has taken one crop of hay. The soil is clay, with a little sand and a gravel subsoil. To obtain the best results for a crop of corn, should it be plowed with a breaking or a stubble plow. Should it be too dry to plow in the Fall, what would be the next best thing to do with it?

ANS.—As a rule, it is better to plow a clover sod upon clay soils in the Fall, and upon light soils in the Spring, for the reason that the Winter weather has a beneficial effect upon fall-plowed heavy soil, but a contrary effect upon light soil. The plowing should be done as late as possible in both cases. This is because corn succeeds best upon a freshly plowed clover sod and upon fresh, moist, mellow soil. In this special case it would doubtless be best to plow the ground in October, when the Fall rains have softened the soil, and leave the surface rough until Spring, when it may be worked fine with a cultivator and prepared for planting without a second plowing. A stubble plow which will turn the furrows on edge and lap them should be used.

To Purify Sorghum Molasses, etc.

J. B. F., no address. 1, asks what is the best method of purifying sorghum molasses; 2, what kind of fish is best for a small pond.

ANS.—If it has been made from cane growing on bottom land where no limestone abounds, or has a bitter taste from not being properly defecated, put it into a pan and dilute it with water until it stands 12° Baumé Bring it to 160° Fahr. and add sufficient milk of lime to destroy any acid taste. The heat may be raised to 212° Fahr., perhaps with benefit Then allow it to cool and settle one hour; draw off and cook down to a thick sirup. If sorghum molasses contains other impurities, then it must be purified by passing through a bone charcoal filter. Always bear in mind that iron pans or evaporators and too much lime tend to produce dark-colored molasses. Where cane grows on limestone soil, lime is never needed at all. 2. European Carp. See article on it elsewhere in this issue.

Miscellaneous.

J. E. S., Wellville, Va., asks, 1, whether there is any grass that will grow in an oak and hickory grove, so as to make a good sod—soil light, sandy; 2, what sort of millet is most forward for feeding in the Spring; when should it be sown; and would it be well to sow grass seed with it. 3, He has some land on which he wishes to sow wheat, seeding it to grass at the same time, and desiring to plant pear and apple trees on it, he asks what should be the distance between the trees and whether they should be set out in Fall or Spring.

ANS.—Quack and Orchard Grass are the best that we can suggest. 2 Hungarian Grass. May 10th, we sowed ours. Yes; grass seed might advantageously be sowed with it. The Hungarian requires but 60 days to mature sufficiently for cutting. 3 Plant the apple trees 30 feet apart each way; the pears not less than 20. For your climate we should prefer Fall.

W H A., Westfield, Mass., asks, 1, does it improve sweet corn to top it; 2, what is the best liquid manure for celery—would hen manure do.

ANS.—1, The ears of a given stalk might be improved by cutting off the tassel, so long as there were plenty of pollen from other tassels to pollenate the silk. 2 Yes, admirable—a gill of pure hen manure to a gallon of water. Perhaps no liquid manure is better than barnyard—a teacupful or so to a gallon. The apples are not yet received.

S R C, Balesville Miss, says he sends a specimen of a bean and leaf to see if it is the Catalpa bignonioides, *var.* speciosa, which Western railroads are reported to be setting out extensively for ties, one set being reported to outlast three of white oak.

ANS.—The specimen does not seem to have come to hand, though possibly it will be found among our wheat specimens. The wood of the Catalpa speciosa has been proven very durable. Later. It is C. bignonioides. Cannot say as to speciosa.

A K M, McKenzie Tenn, asks what would be a good hedge plant for that section.

ANS.—The Privet should do well with you. These grow more readily from cuttings and young plants may be bought of any nurseryman for a small sum per thousand—probably $5 00. The Japan Quince is a fine shrub for hedges and may be bought for $5 00 per hundred. Look in the catalogues for Cydonia or Pyrus Japonica.

E N. B., Bedford, N. Y., says: "I would like to hear the experience of some one who has used oat or wheat chaff for packing ice or for lining an ice house. In the latter capacity would it be *more* or *less* likely to rot than sawdust?"

Charles Couch Schoharie, N. Y. asks where can be purchase some good Duroc or Jersey Red pigs—pure-breds with registered pedigree, from four to six months old.

Mrs. R. J., Utica, Ill., asks whether the Great London Tea Company of Boston, which advertises in the RURAL is trustworthy.

ANS.—Quite so.

J H. Marshall Cordova, Ill, says he wants 200 calves for feeders.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, AUG. 27, 1881

A FARMER'S HOLIDAY.—The annual "harvest home" celebration or farmers' pic-nic is an event eagerly anticipated by the farmers of lower New York, and Rockland Lake is the chosen place for the yearly holiday. Last Wednesday some 10,000 or more "merry-makers" assembled there to enjoy a good old-fashioned pic-nic, and, as we have no reason to doubt, it was a gala day for them. However, we do not mention this simply as a fact, but for the moral. If there is one class of people who deserve, and can enjoy, such a day of recreation, it is the farmer, yet no class thinks so little about a day's or a week's rest as they. Now that harvest, in most parts of the country, is over, why cannot the farmers in every town unite in a day's recreation and resolve to have a little respite from continual toil? Our holidays are too few, and the farmer's "off" days in the Summer are scarce, yet he can increase them if he will.

THE BOSTON EXHIBITION.—Boston's Mechanical Fair opened in that city on the 17th inst. under favorable auspices. It is the first annual exhibition of the New England Manufacturers' and Mechanics' Institute. Governor Long of Massachusetts presided at the opening exercises and the oration was delivered by Commissioner Loring. Beginning with an interesting outline of the changed condition of life resulting from modern invention and science, and glancing at the usefulness of State and National Expositions, he passed on to a consideration of the leading industries, of this country. The exhibition is intended to fully represent New England's arts and industries and we have no doubt but that it will be a grand success. The buildings cover about ten acres of ground, and will be open from now until November; thus ample time is given for many thousands to be present from all parts of the land. We congratulate Boston on her enterprise.

A MARVELOUS CHANGE.—The Bureau of Statistics has just stated that during the month of July 1881 there arrived at the principal ports of the United States 56,000 immigrants, against 49,850 during the corresponding period in 1880. Statistics show that of all the immigrants who arrive in this country seven-tenths land at Castle Garden in this city; thus, 39,200 of the new-comers must have passed through this huge caravansary. One of its departments is a Labor Bureau, whose object is to provide for the laboring classes among the strangers work in any part of the country where their services may be needed. In spite of the enormous influx of late, the Bureau finds the supply of this class less than the demand. Requisitions for help are pouring in from the wheat and corn fields of the Northwest and West, from the cotton fields of the South, from the railroad-building works of the Southwest, from the factories of New England, the mines of Pennsylvania and the varied industries of the other Middle States. Singly, in tens, in hundreds and once or twice in thousands the strangers are sent off to their various fields of labor to make a livelihood for themselves and add to the wealth of the country. It was only the other day that hundreds of immigrants after a vain search for work here, returned embittered and disconsolate "home"—home whence distress and starvation had driven them. How marvelous a change in a few years! And then in what exultant trumpet-tones does it not speak of the mighty push and energy of our multitudinous industries!

PLANT BLACK WALNUT.

THE Boston Furniture Exchange, at a meeting the other day, announced an advance of from 10 to 15 per cent. in the price of black walnut furniture. The advance was based on information that the great demand for furniture of this kind since the war had made such great inroads on the black walnut forests of Indiana, our main source of supply, that the supply there had begun to fail. Everywhere prices for this timber are rising. From $75 to $80 a thousand in 1874 the price has already gone up to from $90 to $125 a thousand, according to size and quality. Next to oak and hickory, black walnut used to be the the commonest tree in the State of Illinois, but the State of Illinois is now almost destitute of black walnut, and attention is being directed to other sources of supply, especially to Kentucky, Tennessee and Mississippi. A black walnut tree will grow to sawing size sooner than a pine; and to-day in our markets it is quoted at three times the price of pine. In view, then, of the ease with which it can be propagated, its rapid growth, the high value of its timber and the certainty of a constant and profitable demand, why is it not more extensively planted? In this as in other cases, we are living on our timber capital instead of on the interest of it.

INTERNATIONAL SYMPATHY.

ONE thing even the most careless observer of events will scarcely have failed to notice, and that is the sympathy for, and interest in, our stricken President, as manifested by foreign governments and peoples. Almost every civilized nation has more than once cabled its messages of condolence and sympathy, and the intense anxiety with which the least item of news from Washington is awaited in foreign lands shows plainly that these expressions of sympathy are not simply cold and formal, but sincere. Especially is this true of our Mother Country, England, which through its admirable Queen, has many times expressed the greatest concern for our President; indeed, if report be true, the whole populace are on the *qui vive* for the latest cablegrams. But in the message which Queen Victoria sent to Mrs. Garfield, when recently the President suffered a serious relapse, there was a warmth of womanly feeling, an intense anxiety, a keen sympathy for a sister in affliction, such as have not been expressed by any other ruler in Europe. Mrs. Garfield's unusual fortitude, which has won for her the highest encomiums of the American people, is scarcely less appreciated abroad, and the sufferings of the President and this fortitude of his wife are subjects of comment in other countries than our own. These marks of respect from other peoples Americans will not easily forget.

AMERICAN OLEOMARGARINE OIL IN HOLLAND.

HOLLAND is the largest European importer of American oleomargarine oil. The product is there churned with about 20 per cent of fresh milk and some coloring matter and after it has been chilled into "butter," or butterine, it is exported chiefly to Great Britain, either under its rightful name or in the guise of genuine Dutch butter. It began to be imported in large quanties in 1874, and so profitable to all parties connected with it did the handling of the stuff prove that in 1878 there were 20 butterine factories, which had increased to fully 100 in 1880, according to the report just made by our Consul at Amsterdam. In that year estimates of the quantity imported vary from 75,000 to 120,000 tierces, or from 11,000 to 15,000 tons. For the first time almost all concerned in the business then suffered heavy losses. Prices of the product varied greatly every month of the twelve, from 110 francs per 100 kilograms in January to 65 francs per 100 kilograms in March, sinking in November from 106 to 88 francs per 100 kilograms. During the fierce competition that then reigned a great deal of inferior stuff was thrown upon the market, and the butterine made from this, coming into direct competition with the poor article made from the low-grade, home-made oleo of France, Austria and Russia, inflicted heavy losses on all who handled it. Hitherto it had been the general practice with Dutch dealers in American oleo to buy and sell the article on the faith of inspection certificates from American inspectors; but as our exporters of the concoction in the heat of the struggle frequently palmed off on their customers an article much inferior to that called for by the certificates, it is likely that in future all consignments will be sold on arrival, at public sale, an opportunity being afforded intending buyers to inspect as many tierces of each lot as they may desire before purchasing. American greed seems to have over-reached itself here.

COMBATTING RAILROAD ABUSES.

THE Anti-Monopoly League is an organization lately founded, whose efforts are at present directed mainly against the abuses of railway transportation. Last Thursday a conference of this body and of other organizations in sympathy with it objects, was held at Utica, New York. The pinciples enunciated must meet with the hearty support of all good citizens. Pithily they were, the duty of advocating, supporting and defending the rights of the many against the privileges of the few; that corporations, the creation of the State, shall be controlled by the State; that labor and capital are allies, not enemies, and that both should have even-handed justice. Among the expressed objects of the organization that meet our unqualified approval are, briefly, the enactment of laws compelling transportation companies to base charges upon cost and risk of service, instead of on the theory, "what the traffic will bear;" also of laws to prevent discrimination in freight charges against any citizen or place, as well as of laws making it the duty of public law officers to defend a citizen's rights against injustice by powerful combinations. We also heartily advocate laws to prevent the further "watering" of stock and other devices by which a fictitious value for public highways is created; stringent laws against bribery, including the prohibition of free passes to legislators or to influence legislation, and laws providing for the restriction within proper limits, of corporate powers and privileges generally. While not willing to oppose, we are not prepared to support without qualification some of the other enunciated objects of the body, such as the enactment of laws to prevent railroad combination, which in our opinion should be restricted, not entirely prevented; and the appointment of a Board of Railroad Commissioners, a measure towards which we are well disposed, but whose paramount advantage is still a matter of fair discussion.

In view of the approaching Fall election of those who will have to deal legislatively with transportation questions in the various States, and also in consideration of the gross abuses of the privileges accorded to railroad companies as well as of the danger to the public interests from the monopolizing tendencies of these gigantic corporations, and the difficulty of reaching a just decision as to the best form of legislation in regard to them, we shall henceforth give more attention and space than heretofore to the discussion of the important question of railroad transportation.

FAIR TRADE AND FREE TRADE.

IN 1846 the British Parliament, under the leadership of Sir Robert Peel, and through the tireless agitation of Richard Cobden, supported by the widespread and energetic Anti-Corn-Law League, passed an act repealing the duties on importations of cereals. The measure was bitterly opposed by the farmers of the United Kingdom with whose products it permitted foreign goods to be brought into free competition; and for this reason the farmers of the United Kingdom have ever since been outspoken in their antagonism to it. It was also bitterly opposed by the Conservative Party because that party found its main support in rural districts where its leaders were mighty land-owners; its leaders have continued to be mighty land-owners, and the party has continued to find its main support in rural districts, and therefore though the Conservative Party has from policy generally masked its disapprobation of the repeal of the corn-laws; yet whenever a favorable opportunity has arisen to strike a damaging blow at the principle on which the repeal was made, the Conservative Party has never hesitated to strike that blow.

Quick upon the repeal of the duties on imported cereals, the duties on importations of a great number of other articles, especially those on all raw materials, were also removed, and England straightway became the apostle of Free Trade among the Nations—the earnest, ubiquitous advocate of the removal of import duties on all foreign wares by all governments. The country was a vast workshop in which goods were made by the best machinery, the most skillful labor and the largest capital in the world. The raw materials of her manufactured products were her only importations of any account beyond the food for her toiling millions. By removing the import duties on both of these she cheapened the bread of the multitude as well as the goods they turned out, and by advocating Free Trade abroad she was merely canvassing for markets everywhere for her cheapened wares. Other countries having continued deaf to her persuasions and having so vastly improved their own manufactures that not only is England losing what markets she has in them, but finding them sharp competitors in other markets which she has hitherto deemed exclusively her own, she is now changing her cry of Free Trade to Fair Trade.

So long as Free Trade gave the multitude cheap bread and promised an unlimited foreign demand for their goods, the multitude hurrahed for Free Trade, but having failed in its promise, the multitude is likely to abandon it, and with equal enthusiasm shout Fair Trade, which makes the same promise. The country is seeking ample markets for her goods, and is willing to preach any doctrine the voluntary or compulsory adoption of which by other nations is likely to give her the boon she craves. Reciprocity is the burthen of the new cry—that all foreign goods shall be admitted duty free only from those countries which shall admit British goods on the same terms. It is proposed to admit duty free the raw materials of Britain's manufactures, but not those of her population, for, as a sop to the farmers, a very moderate duty is to be levied on all articles of food from foreign countries. This principle is likely to grow in popular favor and to have much weight henceforth in political action. Already the agricultural community, the manufacturers and the Conservative Party may be put down as its supporters, and on the plea of protection for British agricultural and manufacturing industries thousands of the working classes, hitherto mainly Liberals, will probably soon yell lustily Fair Trade instead of Free Trade.

BREVITIES.

GROWING grain is personal property, and an attachment upon it will hold good as against a subsequent mortgage, according to a recent decision of the Supreme Court of California.

THOSE who have so kindly favored the RURAL with specimens of their wheat would greatly oblige us if they would state the yield when it has proven large, and also to what special cause they think it is due.

No property pays so well for improving as a flock of sheep and none can be so well improved by careful breeding. But a shepherd should exercise the greatest care in changing his rams. When one has procured good stock he should hesitate to destroy it by introducing animals that will not match. Matching is necessary to successful mating, especially with sheep which are so easily impressed for good or ill by breeding.

SECRETARY W. I. CHAMBERLAIN telegraphs us from Columbus, Ohio, under date, Aug., 21, "The August estimate of the Ohio Board of Agriculture, compared with 1880, is as follows: wheat, 72 per cent., or 38,000,000 bushels; against 52,500,000 bushels; corn, 70 per cent., or 74,000,000 bushels; against 105,000,000 bushels; oats 107 per cent., or 22,500,000 bushels; against 21,000,000 bushels. The wheat estimate is based on actual measurements of the yield per acre from 1,000 thrashing machines for three week's thrashing in all parts of the State."

Compare this with our estimate of the outcome of the crops in our Crop Special as long ago as June 25—a remarkable coincidence, isn't it?

Is the relation of supply and demand, tempered by speculation, the only means of regulating the price of grain? Nations that have advanced farthest in political economy seem to think so. Russia is not in the front rank of these, so Russia is about to try to regulate the price of grain by governmental interference; or, to put it in more official language, "the Ministry of the Interior is considering measures for preventing the productive power of the people from being improperly turned to account by speculators." It is intended to establish throughout the Empire official control over all the Russian grain markets, and over the price of grain for home consumption and exportation.

IN the case of Thomas vs. Moody, tried the other day before the Supreme Court of California, the facts were these:—Moody instructed an irresponsible firm to buy wool for him, expressly agreeing to furnish the money to pay for it. When the wool was delivered to him he sold it, and, after deducting his commission for selling it, placed the proceeds to the account of his purchasing agents who were indebted to him. Upon demand being made on the agents for the price of the wool, they stated the facts to the sellers who at once brought an action for the price of the wool against the principal, Moody. When they sold the wool they were ignorant of the relations between Moody and his agents. The Court below had given judgment in favor of the defendent; but this was reversed by the Supreme Court which gave judgment for the price of the wool, $13,268.20. In a scathing opinion the judge indignantly exclaimed. "Whence comes the right of the defendant to make the property of the plaintiffs, innocent parties, pay the debt of his agents?"

IN the case of Dresbach vs. the California Pacific Railroad Company, decided on July 2, the railroad had taken a lot of grain sacks to be carried from San Francisco to Jacinto, and they were lost. Dresbach sued for their value and the company set up as a defence that as its line ended at Knight's Landing, a point short of Jacinto, it was not liable for damages. The Court, however, said that as the evidence showed the sacks had been received at Jacinto by the company's agents and had been lost through their negligence, the company must be held liable for their value.

Miscellaneous.

SOUTHERN MINNESOTA.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

HAVING two or three days to spare, we drove across the country, from Estherville, Iowa, to Sherburn, Minn., and were enabled to get a very accurate idea of the interests we can after all but so feebly portray. Many features of the landscape which greeted us were well calculated to inspire admiration and a desire to proclaim the marvelous beauty of the picture, and the wondrous wealth it adorned; undulating prairies, dotted here and there with natural or artificial groves of timber, beautiful lakes of clear, limpid water, with gravel bottoms and banks well defined; farm houses, and barns in the edge of large fields of waving grain, and all evincing industry and thrift; grazing herds numbering each from tens to hundreds; district school-houses within convenient reach of the youngsters; and in the dim distance the telegraph poles indicating the line of the Minnesota Southern R. R. now a busy division of the C. M. and St. P. Ry. which has contributed so much to develop and advance this section. Corn looks thrifty, and is doing well, though backward on account of the late, wet Spring and drought. Wheat, (of which there is only a limited amount sown), as well as oats and other small grain are very promising for a full average yield, should no mishaps intervene. There has been considerable breaking done this season, which has mostly been sown to flax, upon the sod; this too is looking fine and, by the by, deserves more than a passing notice as this method of flax culture gives remunerative returns the same season the virgin soil is turned to the sunlight; about three pecks are sown to the acre, which gives an average yield of seven to eight bushels, worth from 90 cents to one dollar per bushel. This, of course, could not be done upon stump-ribbed and rocky-faced farms, where extensive fertilizing is the *sine qua non* for a crop, but Martin County has a deep, rich soil, possibly a little deficient in sand, yet with enough to aid in growth and drainage; and these lands, covered with a luxuriant growth of nutritious grasses can be bought from $4 to $8 per acre. As might be inferred, the most lucrative branch of husbandry here is stock-raising and dairying, which are increasing fully fifty per cent. per annum in the numbers as well as quality of the herds and flocks. Several of the best Short-horn strains have been introduced for the raising of grades; and full-blood Cotswolds are at the head of the flocks; while Berkshire and Poland-China hogs are the favorite cross. Farms partially improved can be bought in this county from $5 to $20, according to location, improvements and surroundings.

There are four creeks of considerable size coursing through the county, and 66 meandering lakes within its limit, all abounding in fish, which are being augmented by the Fish Commissioner of the State. Wells of good water average about 35 feet in depth. Natural timber is found along the streams and around the east, center and west chain of lakes, more abundantly in the southern tier of townships; while artificial groves of timber are almost as numerous as the developed farms of the county; groves ten years old, containing five acres or over furnish fuel for the family fireside.

Let us give you a brief statement of a single farm we visited, as an eye-opener: about two miles southwest from Sherburn is the farm of Messrs. Cargill and Van Valkenburg, of La Crosse, Wis., containing 6,600 acres of which 4,000 are under the plow. There are two good residences and two large barns, with a cattle shed 30x1,000 feet inclosed by a tight board fence, two stock wells, run by wind-mills, for Winter use, there being a good supply of water from the lakes in the Summer. There are 675 head of cattle, fully one-third Short-horn grades; 1,050 sheep, grading from full-blood Cotswold bucks, and about 300 head of Berkshire and Poland-China hogs; and the firm is yet in its infancy. The above firm farm the entire interest without renting any portion, C. E. Wenzel of Sherburn being their agent, who also buys grain, wood, etc. at the station, while H. E. Anderson is their superintendent on the farm. We heard there was a new creamery building about four miles north of Sherburn, but were unable to get detailed information. It cannot help doing well, and several others would prove profitable both to the farmers and their projectors, for the grazing is ample; the grasses are sweet and succulent; the water is pure; the climate salubrious, healthful, free from malarial taint, and the numerous groves furnish Summer shade and Winter shelter from wind. Stock and dairy investments will pay here 30 per cent. net profit per annum. Nor should we overlook the great interest felt in raising good horses, including many roadsters, but principally the solid, tractable, serviceable Norman.

The population of Martin County, in June, 1880, was 5,921, and since then there has been a material increase. The county is well supplied with market facilities, and connections with "all the world and the rest of mankind," by the Southern Minnesota Division of the Chicago, Milwaukee & St. Paul Railway, passing through east and west. Jno. M. Egan is Division Superintendent. This is a part of one of the most extensive railroad systems on the continent, under the general management of S. S. Merrill, of Milwaukee.

This county has no railway indebtedness, and while the present aggregate tax averages only about three cents, this will soon be diminished, as many lands heretofore inaccessible will soon be subject to taxation, comprising the railroad and State lands, thereby increasing taxable values and reducing the per cent. of the tax. Here are a rich soil, healthy climate, abundance of pure water, natural and artificial groves of timber, railway advantages, educational, religious and social privileges. Moreover, the geniality and enterprise of the citizens must be added as a no less attractive feature in its desirability as a resort for hunting and fishing. So many, indeed, are the sporting advantages of this region, that it is a kind of sportsmen's paradise, where the fruition of the angler's or hunter's hopes is assured to satiety. There is talk of connecting the chain of lakes north and south in this county, which is feasible at an expense of from $3,000 to $5,000, which would open the way for a steamer over a beautiful route fifteen miles in length.

FAIRMONT, the county seat, is prettily located on an undulating site, an elevation rising to the south, fringed with timber to the south and southwest, under the shadows of which lies one of the beautiful lakes of the chain. The town has three church edifices, a graded school of three departments with three teachers; Masonic and Odd Fellow organizations, two live newspapers, the Martin County Sentinel, an eight-column folio in its eighth volume, by Frank A. Davy; and The People's Advocate, by Mr. V. B. Scribner, a seven-column folio in its first year. The last census gave the place 541 population within the corporate limits while some of the best residences and a liberal percentage of the population are located just outside of the enumeration. Pleasure-seekers, for hunting and fishing, from as far as our Eastern and Southern cities, make this a place of resort, and securing the comforts of the Occidental Hotel, they hunt, fish, recreate and are happy. Situated in a good agricultural center, business is well sustained, and possesses every element for growth. Among these is a flour and feed mill (two buhrs to flour and one to feed) run by wind power, having a 60-foot wheel, which in a twenty-mile breeze is equal to 40 horse-power. This belongs to P. Wallaston from near Liverpool, England, who in addition to extensive mercantile interests is also farming 380 acres, and raising stock adjoining the town; his wheat last year averaged 17½ bushels per acre. Mr. Wallaston; C. H. Bullard; (Land, Loan and Insurance Agent) A. L. Ward; (of the Martin County Bank), and H. M. Blaisdell, (Attorney and Real Estate Agent) will accept our thanks as representatives of the THE RURAL, for their numerous courtesies. Inclose a stamp for return postage, and either of them will cheerfully contribute his time to answer any letters of inquiry regarding the town or county.

SHERBURN is a nice prairie town next west on the railroad, on an elevation which gives an extensive and picturesque view of the surrounding country, and with a population of only 113 by actual count, it is the largest, healthiest, brightest infant of its age we have seen. A church edifice, good--school-house, costing $2,000, efficient teacher, steady improvement, stores, lumber yards, warehouse and streets filled with teams laden with grain, wool and other farm produce even at this dull season of the year, bespeak a fine present and a promising future. A trifle over a mile north of here is Fox Lake, one of the "beauty" spots of Southern Minnesota, with a gravel bottom and sandy beach, skirted with a fine natural timber, and embossed with a couple of green-clad islands, and abounding in fish. This beautiful body of water, about one mile wide and five or six long, could be made the most popular place in this section. To do this, a good lodge, convenient and comfortable, with satisfactory beds and board, should be erected on the bank of the lake for which there is an elegant location. Here conveniences should be supplied for hunting and fishing—in season—and there should be conveyance to run regularly to and from the trains, for the exclusive accommodation of the guests. Here is a chance for some man to make himself both happy and useful, and make money beside, by developing this project.

"Thank you gentlemen!" is what we said in private, and would repeat in public, to Messrs. C. E. Wenzel, and W. M. Masters; (proprietor of the City Hotel) for their kind attentions and assistance in our work. Any correspondence addressed to them, would receive prompt attention.

THE THREE F'S.—To-day, Monday, August 22, the new Land Act goes into force in Ireland. The Lords' amendments somewhat emasculated the measure originally proposed and valiantly defended for seven months by Gladstone, yet it now gives to Irish farmers more than they have ever had of the three F's—fair rents, fixed tenure and freedom of sales.

Fay's Prolific Currant.

IN reply to the remarks of Mr. Lyon on Fay's Prolific Currant in a late RURAL, it may not be improper to say that no one acquainted with the late Mr. Fay would wonder at his holding this variety for the purpose of testing it in different generations alongside of all the popular varieties. In this connection let me ask—is not the practice of rushing new varieties of fruit plants on the market.—i. e. selling them first and testing them afterwards—sometimes overdone? Of the two, is it not better to be rather too slow than a little too fast? As our good friend, Mr. Fay, has now departed from us we hardly think anyone will question his wisdom in doing just as he thought right and best in the matter. His enthusiasm on the subject of fruit growing was almost without bounds. In this community as a citizen, neighbor or friend, none stood before him, and in our Fruit Growers' Association we all feel that there is a gap which will never be filled. His success in originating was great. His new peaches alone (better and earlier than any others known in this locality) would have netted him a fortune had they not been destroyed by the yellows. G. S. J.

Fredonia, N. Y.

Literary Miscellany.

WEEDS.

ALONG the roadside and up the hills:
Peering demurely into the rills:
Lifting their faces up to the sky;
Throwing their kisses to each passer-by;
Trailing their gowns all over the grasses;
Waving their hands to a bird as it passes;
Calling the butterflies—laughing and gay,
Ragged and rollicking all the long day.

How the winds love them! How the bees linger!
How the birds woo them, each happy young singer!
How the sun kisses them, eager and warm!
How the grass shelters them safely from harm!
Who is so jolly, who is so free,
Of all the bright blossoms that grow on the lea?
Purple and azure, golden and red,
Some with big bonnets and some with bare head;

Some with gold stars on their foreheads so sweet—
Some with great mantles straight down to their feet;
Some like a drift of May snow, pure and white,
Some that are dark as the middle of night;
Some with shy eyes that are hidden 'neath lashes,
Some with the largest and gayest of sashes;
Some with lips sober and some with arch smiles—
All with the bonniest, gladdest of wiles.

Amber and rosy, snowy and blue,
Some that are false and some that are true;
Yellow and crimson, sapphire and pink—
All are as fresh as the dews that they drink.
Along all the roadsides, down by the brooks,
Hiding away in magical nooks
Down in the meadows, always aglow—
Dearest of all the things that grow.

—FANNY DRISCOLL, in Boston Commonwealth.

COUSIN FRED.

CHAPTER II.

DECISION.

Cousin Fred slept but little that night: not only was he miserable on his own account, but most anxious on Lucy's. He held a secret that he felt it would be terribly wrong for him to pass unnoticed.

His cousin was not quite eighteen. Supposing some scoundrel, afraid openly to show his face, had secured her affections, and harm were to come to her, Fred Beaufort felt he should never forgive himself.

Yet he still shrank from informing his uncle—at least, until he knew something more about the man she met. Mr. Brand was stern, not to say hard, of disposition; and Fred Beaufort felt capable of doing anything rather than get Lucy into trouble, for he well knew her position at Silverville. So again he returned to the old question—what was he to do?

He couldn't possibly tell Lucy that he had been spying on her actions, request then her confidence. Of all persons—and he sighed—he would be the last she would give it to.

"I know, he finally determined, "As her cousin, and next to her, after uncle Brand, I have a right—nay, it is a duty—to shield her from harm. I will see if I cannot find out who is the person she meets. I'll come upon them as if unexpectedly. She then will be forced to confide in me; and, as Heaven hears me! if the man is worthy of her love, I'll stand her friend without one thought of myself."

And no more loyal and chivalrous heart beat than Fred Beaufort's.

The next day Linda was out of temper. She had risen amiable enough, but cousin Fred, for a wonder, was thoughtful, not to say pre-occupied and dull—an offence, when in her fascinating presence, which she held punishable by her law. Hence she was out of temper; and to spite him, when visitors called, flirted desperately with a certain captain of the Guards who was one of them.

Poor Linda! If she had but guessed how thankful her cousin was to be released, as it were, from duties she rather exacted than he voluntarily paid, and able to watch Lucy! Her manner, like his own, was changed. She was quieter, more retiring, while he noticed frequently, when she fancied she was not observed, a pained, anxious look steal over her pretty face. Once, raising her eyes, she had encountered his. A rush of color had come to her cheek; then, after a moment, she had changed her place.

"No one would less prefer to meddle in her affairs than me," he thought; "yet it must be."

When the girls had left the dining-room that evening, instead of resuming his seat, Fred Beaufort fetched his hat, and telling his uncle he had a call to make, quitted the house by the window, as the previous evening.

During the day he had formed his plans. About half a mile down the river was a bridge. Proceeding to this, he crossed to the other side, and made his way back to the spot where twice he had seen Lucy attach her boat.

The question then was, would she come this evening? Almost as he put the mental query he heard the oars. Three minutes later he perceived through the bushes Lucy, in the gray garb, land and come on, swiftly passing him. He followed cautiously at a safe distance, fearing discovery. Not for worlds would he have Lucy see him!

Just then his cousin arrived at where the bushes were clearer. He saw her move quickly forward. A dark figure advanced as quickly to meet her. A second, and they were clasped in each other's arms. Fred Beaufort dropped back a step, with difficulty checking the astonished cry that rose to his lips. It was a woman!

A woman—yes! But though his heart began to beat with a great sense of relief that amounted to joy, he rapidly asked himself what woman? Who could she be? What woman need Lucy thus meet clandestinely?

As yet the question was not to be answered. The two had moved on to the more open space, where he dared not follow.

The conversation, which seemed animated, lasted not more than a quarter of an hour, when, turning, they came slowly towards the bank. While they were within his hearing Fred Beaufort heard these words:

"Do not seek to persuade me. It is useless; I am resolved."

The voice was Lucy's—the accents low and passionate.

"Do not act hastily," replied the other. "Reflect—think, Lucy, what you renounce."

"Nothing," broke in the girl, "but what I shall esteem greater gain. You cannot tell how I hate Silverville! How I long, long to be away—away with one whose love I know is true. Ah! better love than all! What is poverty to that? I shall be here again at midnight. If you do not meet me, I shall go alone."

The woman made some inaudible response, then they were beyond hearing. What did it all mean? Surely the mystery increased.

Soon there was the sound of the woman returning.

Letting her get to a safe distance, Fred Beaufort followed her. She proceeded to the town; there by the light he saw her face. It was that of a middle-aged woman, and had once been very handsome, but now was pale and haggard, as from illness or privation. She made her way to a house in a retired street. As she reached it, a woman came up from the opposite direction.

"Ah! Mrs. Melville," she said, as Fred Beaufort passed. "Here you are, ma'am; I was so frightened, I was, lest I couldn't get my bit of shopping done, and be home before you; and here we are together."

Mrs. Melville, whatever had she to do with Lucy, or Lucy with her? Then, with a start Fred Beaufort remembered that Lucy had said she would leave Silverville that very night, and hurriedly he retraced his steps. Great Heaven! what was he to do? Surely he must inform Uncle Brand now—matters were growing desperate. Still he hesitated. How could he tell it? What could he say? Yet one thing was certain—Lucy must not be permitted to go.

On entering the drawing room he found Linda alone, her temper by no means improved by having enjoyed her own company for nearly two hours.

"Where is uncle?" asked Fred Beaufort.

"Gone to Mr. Fairbro's," was the short reply, as the beauty returned to the book she was not reading.

"And Lucy?"

"Has a headache, or pretends she has, and has gone to her room; not that her society or anybody else's has been much loss to-day."

"What has put you out, Linda?"

"Put out!" responded the beauty. "I am not put out; but I suppose one is not expected to be very gay when one has been alone all the evening. I fancy Lucy has given me her headache. I shall go to bed too; there is nothing to entice one to sit up when papa is out. Good night."

With an assumption of indifference she moved to the door. Perhaps she imagined her cousin would detain her, but he did not.

"Good night, Linda," he said quietly. "I am sorry you have had so dull an evening. I trust sleep will remove your headache."

"Thanks," she replied, coldly, as she passed from the room.

Never had Fred Beaufort been so glad to get rid of his handsome cousin before.

"Linda ought to be the one to seek Lucy's confidence,," he thought, "but I could not entrust such as she, so purely selfish, with Lucy's secret. To me she seems to regard Lucy little more than as an upper servant or lady-help. Well, my dilemma yet remains—Uncle Brand's out at Farebro's, and may not return until two or three; for when those two get talking politics, there's no separating them. I see, whatever is done must be done by myself."

He first thought he would send a message to Lucy, asking to see him. But that might appear singular, as she had given out that she was indisposed, and had gone to bed. No, he must wait, as he knew she was doing—for midnight.

The household were generally all in their rooms at a quarter past eleven; and Mr. Brand's absence made no difference, for he always let himself in the back way, leading from the stables, and went to his room, where everything that he might require was placed ready.

Thus as that hour approached, Fred Beaufort went to his own chamber; but as soon as all was still, he descended again to the dining-room. He had no light; but the hall through which Lucy must pass was flooded by moonbeams coming through the large oriel window.

The clock struck—midnight! Would she come? Had her courage failed her? No! There was a step on the stairs—so light, that it would not have been heard but for the stillness.

Then in the moonlight he saw her quickly crossing the hall. In a moment he was by her side, whispering her name.

"Lucy!"

With a startled cry the girl turned round, and cowered from him.

"Lucy," he said, gently, "where are you going? Oh! Lucy, has there been no one kind to you in this house, that you can go like this?"

"You do not know—you do not know, cousin Fred," came her trembling answer. "Oh! it is not that, no one has been unkind—but I must go—I must! You must not stay me!"

"Yes, Lucy, I must!" he responded, gravely. "What danger may you not be running into? Do you fancy for a moment that I could quietly stand by—I—your cousin—and—friend—and see you quit the house at such an hour? You—so young, and without a friend save this house contains!"

"You are wrong," she replied, in a low tone, but which was quickly recovering firmness, "I have a very dear friend!"

"One, Lucy, you may imagine so, but who can be no friend to you if they permit you to take such a step as this!"

"I do it without their permission—of my own free will! Cousin Fred you must not—shall not stay me! You have no right!"

"Yes; that of a cousin who loves you, Lucy! Who would have no harm come to you!" he answered, placing his hand on her arm. "Surely that is something."

At his touch a violent trembling seized the girl; tears started to her eyes. He did not know how sweet it would have been to yield to his cousinly authority in all cases but this.

"I repeat, cousin Fred," she murmured, softly, "I must go! No harm will come to me, be assured! I may not tell you more—it's better perhaps, not—but believe that!"

She made a movement from him, but he took [illegible].

"...y, you may not!" he said, firmly; "if you resist my request, I must summon those whose authority——"

"Cousin Fred," she interrupted, with quiet decision, "no authority in this house can stay me! If I would yield to any, it would be to yours—but I cannot! There is one who has greater need of me than any here—and to that one I go!"

"Then, Lucy, I go with you! I will see this person myself, unless you tell me who it is, and why you go!"

The girl paused; then said:

"Cousin Fred, if I tell you, will you then let me go? If I tell you that I have a right to go—that power, no law, can prevent me!"

"Tell me!" he responded.

"Then, I go—to nurse, to cherish, and support—my mother!"

"Your mother!" cried Fred Beaufort, starting back. "She is dead, Lucy!"

"So uncle Brand made us believe, but it is not true! I have seen her! She is poor—she is ill—that is why I am going to her. My mother surely has first claim to my love and to my help!"

"Your mother!"

The voice that spoke came out of the darkness. It was that of Mr Brand, and in a moment, white and stern, he had advanced into the moonlight. For a second Lucy drew back in alarm, then quietly, firmly, she stood before him.

"You have seen her?" he proceeded: "she has dared to break her word, and see you!"

"Uncle, she is ill; I fear, dying! A craving came upon her to see me—her only child!"

"Enough," broke in Mr. Brand; "she has broken her word, and has a right to bear the penalty. She knew well what it was; your banishment from my family. But you are old enough now to judge for yourself. You must renounce her—or us. Choose!"

"Uncle, I have chosen. I am going to her; she is waiting for me now," was the calm reply.

"Go, then, and never put foot beneath this roof nor address word to me again!" exclaimed Mr. Brand.

And Lucy went; Fred Beaufort accompanied her through the moonlit grounds, amazed, pained, yet conscious of a feeling akin to happiness at his heart.

CHAPTER III.

BETTER LOVE THAN ALL.

Had not Mr. Brand been so indignantly angry no doubt he would have seen the advisability, even for appearance sake, of requesting Lucy to quit his house at a more reasonable hour. As it happened he did not, and great was the amazement of the household next morning to find her gone.

He announced that a relation of hers was ill, and she had been called away late in haste.

"A relation of Lucy's, papa?" had ejaculated Linda. "Why, who could that be?"

"A relation on her mother's side," was the curt response. "The less you inquire the better."

"If that's the case, papa, dear," remarked Linda, "I should not dream of making inquiries."

"You are right."

Fred Beaufort said nothing, and his cousin believed he was no better informed than herself. They had both known that their uncle—handsome gay Harry Brand—had married foolishly, and had died shortly after, but that was all they knew, save that the wife had soon followed the husband. This, rather, was what they had been told. Fred Beaufort, however, now knew this information had been false.

After what had occurred the previous evening he fancied that his uncle would give him some explanation; but, as Mr. Brand betrayed no such intention, his nephew did not seek the confidence. His good spirits had returned, also Linda's temper, and to the latter the day passed delightedly. She hardly missed Lucy.

The next morning, however, among his letters Fred Beaufort said was one requesting his immediate return in reference to business regarding his position. Of course he must go.

Of course. So after luncheon he made his adieux in his old, happy way, and was driven to the sta- leaving disappointment behind.

[illegible] had fully made up her mind he would have proposed to her before he left; and she was irritated and annoyed, for cousin Fred's future promised to be a brilliant one. Mr. Brand had also hoped that the cousinship had grown into warmer feelings. Still, it was not too late, unless some one else won his heart.

When Fred Beaufort reached his destination taking a slip of paper from his pocket, he read it. Then, he hailed a cabman, and drove down to Mrs. Melville's.

"You're please to walk up," called the grubby maid of all-work over the balusters.

The young man, complying, was ushered into a dingy sitting-room, furnished after the fashion of cheap lodging-houses. By the window, pale and wan, sat Mrs. Melville; while coming forward to meet him was Lucy, her sweet beauty "making sunshine in the shady place."

"Oh! cousin Fred," she said, "this is kind!"

"Kind, Lucy! Why, did I not say I would call as soon as I came to town? If I have hurried my coming," he went on, in his bright, genial way, "it was because I wanted to learn all about it, for uncle Brand didn't seem likely to tell me."

"Ah! Mr. Beaufort, look round at this miserable room," said the elder lady," and think what this dear child has renounced for me!"

"Mamma you must not talk so!"

"No, indeed, aunt. Love is better than all, you know"—he felt Lucy look quickly at him, but he kept his countenance—"and, by-the-way, I am your nephew Fred. I forgot I had not been introduced, so we will have no more of Mr. Beaufort, Now, aunt will you tell me all about this family secret of the Brands?"

"You are very good," smiled the lady: "I would tell you anything, though in the end you may hold your uncle was right."

"I don't think that possible," glancing at Lucy seated at her mother's feet, holding her wasted hand.

"Then I will make the recital as brief as I am able. When young, I was like Lucy, and not older than she, when my father, who was a scholar and a gentleman, but poor, died, leaving me utterly destitute. I strove to make a livelihood in the usual branches ladies follow, but I was friendless, unknown! Failure met me everywhere. Illness—that of despair—seized me, and I was almost starving, when a kind landlady told me she knew she could get me a place in the showrooms of a milliner. My father had been a gentleman; my pride rose a little; but I was without bread. I accepted the engagement. It was while there, that I met Henry Brand; he loved—he married me. For some months we kept our marriage secret, but your uncle Brand discovered it, acquainted his father, who, in his wrath, disinherited my husband. Six months later Harry was drowned by accident, and his father, stung possibly by remorse, died from the shock, his will unaltered.

"Then your Uncle Brand found me out, and offered, if I would change my name and never own connection with his family, Lucy should be brought up like a lady, and he would endow her well. Only I must promise never to see her; never to let her know of my existence. It was a hard request; but when I knew the suffering I had endured, and might again, I shuddered at the idea of my darling suffering thus. I knew the sorrow would be only mine. She was too young to miss me, and would be reared a lady, as Henry Brand's daughter should. I let her go, though it nearly broke my heart!"

"Dear mother," murmered Lucy, kissing fondly the white slender hand. "Oh, I owe uncle Brand nothing. How dared he part mother and child?"

"Hush, hush, darling; your cousin——"

"Perfectly agrees with Lucy, my dear aunt," said Fred Beaufort. "It was an unmanly and unnatural act. But go on."

"There is little more to tell, I called myself Mrs. Melville, and once more worked for my living. I might have done pretty well, but having no heart, I had no energy. My life was a blank. My only pleasure was to try to picture my Lucy grown, and form little pictures about her. Then my health began to fail, and were it not a sin, I could have said I was glad."

Again Lucy kissed the slender fingers.

"As I grew worse, however, a craving came that I must see Lucy before I died, and I started for Silverville. I waylaid her; I managed to get into conversation. I thought I was strong, but I was weak. I betrayed who I was—and—and—you know the rest. Heaven forgive me if I did wrong!"

"Wrong! Oh, mamma, mamma!" cried Lucy throwing herself on her bosom, "that will not be Heaven's decree nor mine. I am here to nurse you, and soon you will be strong again."

Mrs Henry Brand smiled faintly, then said:

"We are very inhospitable, Lucy. Your cousin needs some refreshment. Go and see to the tea, my love."

Fred Beaufort would have demurred, but his aunt made him a quick, imploring sign, and no sooner were they alone than she said:

"Mr. Beaufort, you seem Lucy's friend—oh, pray be one to her when I am gone. I dare not tell her, but I have not a month to live!"

"Her friend, aunt!" he answered, earnestly. "Ah, if she would let me be that, and more! If Lucy will not be my wife, I shall never marry!"

"Is this true?" cried the sick lady, her eyes brightening.

"Indeed yes. But Lucy does not, I fear, care—"

"Not care! Ask her," and she pointed to the inner room.

His heart beating, Fred Beaufort took the hint. He entered, and found Lucy preparing tea.

"Dear cousin," he said, "aunt is very ill, and is anxious about your future. Now, for such invalids the best medicine is a happy mind. I want to make her happy while she is with us; so I'll say now what I have wanted to say so often, only I thought you never cared for me."

"Not cared for you, cousin Fred?" said Lucy.

"Then if you do, I want you to be my dear, dear wife."

"I your wife! Oh, Fred," gasped Lucy, "no—no—no. Think. What am I? Nobody, and penniless; and you——"

"Are of your opinion," he smiled, drawing her, blushing, bewildered, to him. "Better love than all. Yes, I'll make a confession, but not now, Lucy, for I have something else to say. We shall be married before I go abroad, so that I shall have a right to take care of aunt, who will then be my mother as well as yours."

A week after Linda Brand read with bitterest feelings of mortification the announcement of the marriage of Frederic Beaufort to his cousin Lucy, daughter of the late Henry Brand. She tore the paper in her rage, and that evening accepted Captain Ellis—"Better love than all" not being her motto."

ALL SORTS OF ITEMS.

The Philadelphia Ledger says that Wong Tze Fung, an elderly Chinaman, recently saw a live turtle lying uncomfortably on its back in front of a restaurant, and having purchased it for fifteen dollars, had it conveyed to a wharf and thrown overboard. He is a man after Mr. Bergh's own heart.

Socrates said that there are two sciences which every man ought to learn- first, the science of speech, and second, the more difficult one of silence.

Finding fault with everything is not a good way to make home happy.

A curious discovery is reported from Spain. While engaged in working the lead mines in the Province of Segovia, seventy miles northwest of Madrid, the miners found an entrance into an immense cavern in which they found upon an argillaceous deposit, and in the midst of stalagmites, 500 skeletons of men and women. Ten well-shaped and perfect skulls have been obtained, besides chipped stone and quartz implements and fragments of rude pottery.

Profanity never did any man the least good. No man is richer, happier, or wiser for it. It recommends no one to society; it is disgusting to refined people, and abominable to the good.

Dew is more abundant on cloudy nights, since the heat which is radiated by the earth does not return to it.

Harsh counsels have no effect: they are like hammers, which are always repulsed by the anvil.

Some of the largest mirrors ever manufactured were recently made for the Grand Opera House at Paris. They measured 45 by 52 feet, their weight being from 1,200 to 1,600 pounds each.

Life is divided into three terms: that which was, which is, and which will be. Let us learn from the past to profit by the present, and from the present to live better for the future.

Dean Stanley's last words: "I have labored amidst many frailties and much weakness to make Westminster Abbey the grand center of religious and national life in a truly liberal spirit."

The potato is quite an important and useful item in France. Much of the so-called cognac imported into England from France is distilled from the potato, while in Poland, the manufacture of spirits from this esculent is an extensive trade.

Dr. Franklin recommends a young man, in the choice of a wife to select from a bunch, giving as a reason that, where there are many daughters, they improve each other, and from emulation acquire more accomplishments, and know more, and do more, than a single child spoiled by paternal fondness.

During a recent earthquake at Stockton, Cal., a most curious circumstance which occurred was the stoppage of all of the pendulum clocks hanging against eastern walls, showing that the vibration was from North to South. Clocks hanging against other walls were not effected.

The noble silent men scattered here and there whom no morning newspaper makes mention of! They are the salt of the earth. A country that has none or few of these is in a bad way; a forest that has no roots, all turned into leaves and boughs, which must wither and be no forest.—Carlyle.

Dr. Maclaren, of Edinburgh, Scotland, states that the types of insanity have changed with modern times. For instance, acute delirious mania is now comparatively rare, but mental enfeeblement attended with paralysis is becoming more and more common, and is the result of the overwork and worry of the struggle for existence at the present day.

A nobleman of the Court of France, taking leave of Louis XIV., who was sending him as ambassador to another sovereign, the monarch said to him: "The chief direction I have to give to you is to pursue a course of conduct entirely different from that of your predecessor." "Sire," replied the new ambassador, "I trust that I shall act so that your majesty will not have to give similar instructions to my successor."

The earliest notice of the use of cotton in manufacture is by Herodotus, four centuries and a half before the Christian era. In his day the cotton shrub, in some of its larger varieties probably, was utilized by the natives of Southern Asia. He speaks of a certain plant of India, bearing, instead of fruit, fleeces more delicate and beautiful than those of sheep, and of which the people of that country made their garments. Alexander's generals also brought back similar accounts of the cotton tree and its woundrous products; and Theophrastus describes its culture from exact information.

The fashion of writing on black-bordered paper is about a hundred and thirty years old, and comes to us from Italy. In "Mann and Manners at the Court of Florence, 1740 1786," Mann writes to Walpole, on January 28th, 1745, on paper with a narrow mourning border, as follows: "I believe you never saw anything like it before; here everybody uses it but myself. I begged a sheet for this occasion only, and another to keep as a curiosity. Madame Royale was very unpolite to die just at the beginning of Carnival, to deprive us of all our diversions." Madame Royale was the mother of the Grand Duke of Tuscany.

Adornments for African potentates are an item of some little importance in the Birmingham jewelry trade, which embraces both real and sham jewelry. A firm of what are known as "floral jewelers" has just completed a crown for King Eyo, of Greek Town, Africa. It is a copy of that of William the Conqueror. The cap is of blue velvet, the binding of ermine, and the circle and spikes are of semi-dead gold, decorated with thirty-two real stones, consisting of amethyst, topaz, crystal and emerald. Two scepters have also been supplied—one of gold and the other of silver—for Duke Ephraim Fyamoa IX., of Duke Town, Old Calabar. These ensigns of royalty are five feet, six inches long, one being surmounted by a Maltese cross another by a dove. They are made to unscrew at the end for the insertion of a peacock's feather, which is used in some portion of the state ceremonies of Old Calabar.

MAGAZINES FOR AUGUST.

St. Nicholas.—Contents: Frontispiece. "A Brown-study"; A Brown study. Poem; From Sandy Hook to the Light ship; Milkweed Playthings; Under a Fly Wheel; The Tuneful Old Woman. Jingle. (Illustrated(; Camps. A Game; A Russian Harvest Scene. Picture; Slumber Song; The True Adventures of an Angora Cat; How Miss Jenkins "Got out of it"; The Elf and the Spider. A Fable in Verse; Phaeton Rogers. Chapters XVII and XVIII; Mark the Dwarf; Proud Prince Cham. Poem; Cathie's Story; Flat Boating for Boys; Builders by the Sea. Verses; "A Boy on the Place;" A Strange Foundling; Little Maid Margery. Verses; In Nature's Wonderlands. Chapter X; How we Belled the Rat and What Came of it; The Treasure Box of English Literature; Saltillo Boys Chapters IX. X, XI., and XII; Dame Toad. Verses; For Very Little Folk; Jack in the Pulpit; The Letter Box; The Riddle Box.

Milk-Weed Playthings.—Almost everybody, at some time or other, has made the acquaintance of the milkweed or silkweed, as I have heard it called.

A reason for each of these names is very apparent. If you break a stem, a sticky substance like milk runs from it, which will stain your clothes. You must have seen them many a time. The silk radiates in every direction from the central seed, making a gauzy, filmy sphere, with a small dark center. The seeds cluster about the opening of the pod, until the wind picks them out and carries them abroad, but if you pick some of the pods when green, and put them in a vase where they are not disturbed, the pod will open part way, like an oyster shell, and the fine silken threads, folded and packed so closely in the center, will fly apart and get out, in some way, so that after a while the pod will be covered with a cloud of white. This is very beautiful, and, if it stands in a corner out of the way of sudden breezes, it will be likely to remain so all Winter. You now see why it is called silk-weed. My sister and I yearly collected several of these silk-weeds for our play-house by the stone-wall, where we kept our bits of broken china, and transformed the pods into domestic animals. Often, a pod would be well shaped for a chicken, requiring only feathers to be stuck into the pointed tail, and the stem to be broken off short at the other end and sharpened to represent the bill. Two sticks put in served for legs, so that it would rest on these and on the point of the tail. We not only transformed these pods into poultry but also into quadrupeds of all sorts. Put in four legs, a pair of horns, and a tail, and you have your cow, and one, too, which really gives milk! Leave off the horns, take a a bit of your own hair to use for a tail, and you have a horse.—Emma M. Davis, in St. Nicholas.

Scribner's Monthly.—Contents: The Sailor's Wife; The Isle of Peace; The Daughter of Henry Sage Rittenhouse—I; "No Man's Land; By the Sea in Normandy; To My Dog "Blanco;" Ice-Yachting on the Hudson: Poetry in America, first article; Our Circle; Songs of Nature; Robert Fulton's Experiments in Submarine Gunnery; The People's Problem—II., A People's Government; Peter the Great as Ruler and Reformer—X.; Queen Titania—I; The River Inn; A Rainy Day with Uncle Remus—III.; The Village Convict; Topics of the Time; Communications; Home and Society Culture and Progress; The World's Work; Bric-a Brac.

Purchasable Health.—It is often said, when a rich man dies, that all the money in the world cannot purchase the prolongation of life. It is often said, too, when a rich man's health breaks down, that money will not purchase health. As general propositions, however, both these statements are unsound. When expended at the right time and in the right way, money will purchase health and the prolongation of life. Money will not purchase peaches out of season, but money will purchase peaches when they are in the market. Money will not purchase health out of season, but health is to be had for money, under the proper conditions. When a machine is actually worn-out, it is beyond the reach of repairs. Nothing will do but complete renewal. So, when a man is worn-out, money will not renew him, but there are always times in his life when, by the proper expenditure of money and of time, which is its equivalent, he can buy health and the prolongation of life.

A man crowds his powers through a series of years of excessive labor, and, some day, he drops with paralysis, and from that day forward he becomes a powerless child, to be led kindly and carefully to the grave. The increase of this disease is undoubtedly the result of the increase of unwisely conducted labor. Money can do nothing for it when it befalls a man, but it can do everything to prevent it. "Nervous prostration" has become a too familiar phrase in these latter years. Money cannot restore a shattered nervous system, but, properly expended, at the proper time, it will prevent it, which is a great deal better.

There are two plans of life, by either of which money will buy health and prolong a comfortable existence. The first is, the setting aside of a part of every day for recreation. So far as this can be done it ought to be done, but there seem to be some peculiarities in our American life that forbid it. Competition in business is cruelly sharp, and most men feel obliged to devote themselves to it, when they are in it at all, from morning until night. The

sleeping hours are the only ones which give them release from active care. Now business, followed in this way, from year's end to year's end, is just as certain to ruin health and shorten life as the recurrence of seed-time and harvest is sure. The alternative of daily recreation is a yearly period of rest. There are always slack seasons in business, and these every business man should avail himself of, for rest and recreation. It is in these seasons that there is health in the market, to be bought for money.—Scribner for August.

THE PHRENOLOGICAL JOURNAL.—Contents: Jay Gould; The Phrenological Commentator; Studies in Comparative Prenology; The Puritan Child; Teachers in the Summer School of Christian Philosophy; The Old Orchard; The Cause of Somnambulism; Young Folks of Cherry Avenue; The Injurious Effects of Tobacco; Inebriety in Offspring; A New Bathing Machine; Spoiling vs. Cooking in Diet: Notes in Science and Agriculture; Editorial Items; Answers to Correspondents; Poetry—Personal—Wisdom and Mirth—Library—Publishers' Department.

THE INJURIOUS EFFECTS OF TOBACCO.—The practice of tobacco-using is evidently rapidly increasing. The introduction of the use of cigarettes has greatly extended its use among the young. A larger proportion of the rising generation is likely to be the consumers of the weed than the present generation. If this practice is to continue to increase at the rate it has for the past few years, we shall soon nearly all use tobacco. In such an event, the effect upon the race can scarcely be otherwise than disastrous. The injurious effects of tobacco upon those who use it, and upon their offspring, are sufficiently grave to deserve the serious attention of all those who have contracted the pernicious habit, or who contemplate contracting it. Are the artificial pleasures which the use of tobacco affords worth the cost which they exact? Would not natural and more continuous pleasures spontaneously arising from a healthful condition of body and mind, be the preferable portion? Every one must answer for himself.—Henry Reynolds, M. D., in Phrenological Journal for August.

APPLETONS' JOURNAL.—Contents:—Saints and Sinners; French Family Life and Manners; Authors for Hire; Badeau's Military History of General Grant; Arab Humor. II.; A Talk about Odes; The Wit and Humor of Lord Beaconsfield; Jefferson Davis and the Confederacy; Editor's Table; Notes for Readers.

ARAB HUMOR.—The Arabs, especially under the caliphate, were much given to wine-bibbing, in spite of the dictum of the Koran, which says: "They will ask thee about wine, and gambling, say, in them both is sin and profit unto men; but the sin of them is greater than the profit of the same." Subsequently Mohammed condemned these vices in much stronger terms, declaring them to be abominations which true believers must avoid. There are no fewer than a hundred names for wine in the Arabic language, to say nothing of figurative terms such as "the maiden," "the bride," the antidote," "the captivator," "the pole star" "the ripe," "the sweet-savored," "the beloved," "sweetness," "joy" "Babylonian" (*sell*, enchantress,) "the companion of the sleepless," "the consoler," "the friend," "the babbler," "the soporific," "the key," "the heart of the tun," "quicksilver," "the mother of vices," "the unlawful," "sin," and the like. Alluding to the last term, a poet says:

"They told me that my drink was *sin*,
But I could ne'er believe it.
The only sin I see therein
Is when I have to leave it.

[Appletons' for Aug.]

GODEY'S LADY'S BOOK.—Contents: Colored Fashion Plates; Steel Plates; A Midsummer Drama; Shorter Stories, Poems and Sketches; Recipes, puzzles, games, and Fashion and Work Departments; Diagram pattern.

WE think our readers will agree that our August number is the best midsummer issue of the Lady's Book that has been made in many years. Both in its illustrations and letter press we have striven to make it a valuable companion to each member of the home circle.—Note in Lady's Book for Aug.

The Taxidermist's Manual, or the Art of Collecting, Preparing and Preserving Objects of Natural History. By THOMAS BROWN, F. L. S. New York: G. P. Putnam's Sons.

This book was written more particularly for the purpose of imparting information for collecting and preserving objects of Natural History. It embraces other matter pertaining to this particular field of knowledge and will be found to treat of its subject with much exactness without the prosiness apparent in other productions of like nature.

The strictly scientific researcher finds entertainment in the most tedious treatises on 'ologies, but the amateur does not grasp with the same spirit.

THE life story of the late Viscountess Beaconsfield was, it is said, as strange as that of her husband. It appears that she was the daughter of a retired army captain, named Evans, and in her youth was employed at a millinery establishment at Exeter, first living in Mint Lane, and for a longer period in the old house, which still stands next to the Acland Arms, St. Sidwells. Having casually made the acquaintance of Mr. Lewis, a North Devon gentleman, her attractions fascinated him, and she became his wife. He was considerably her senior, and before long died. She was then living in London, having inherited her husband's fortune, and the fascinating widow was wooed and won by Benjamin Disraeli.

ROSA BONHEUR has nearly completed "A Lion and her Progeny," a picture which is destined for the gallery of M. Gambart, at Nice.

For Women.

CONDUCTED BY MISS RAY CLARK.

IS LABOR A CURSE?

IN a late RURAL "O. W. D." frees her mind on the above question and advances some opinions which, if true, would make this world a sorry place and us most unfortunate mortals. Think of the toiling millions at the plow, in the shop, at the counter, in law, medicine and the ministry, aye, even in housekeeping, and consider that all these, according to "O. W. D.'s" doctrine, are victims of a curse which darkens home and makes life itself a burden. Unfortunate we, who by the sweat of our brow must earn our bread; happy they who have no work to do!

But is this the truth, as ascertained by experience? It seems improbable that one can feel the labor he enjoys to be a curse. Experience teaches us that in labor there is happiness; but no curse brings happiness. Experience teaches us (if we have been so unfortunate as to be its pupils in such a case) that idleness brings with it anything but joy. Yet your correspondent would have us believe that it is less a curse than labor. Let her for a single week enjoy the bliss of "doing nothing," but sit with folded hands from morn' till night; then for another week let her be employed with household duties, or perform any work which may have fallen to her lot, and tell us which seems most a curse—which brings the worst affliction.

But "O. W. D." admits that "nothing should be taught sooner than that this is a working world, and that labor, physical or mental, is a necessity." That is true, but strangely inconsistent with her previous statement that "labor is a curse, as it was intended to be." Labor, as most of us know, is a necessity; but we hesitate to pronounce a curse a necessity. Intemperance is a curse, but not a necessity. The world would be quite as well without it. It is not absolutely requisite and indispensable to our happiness.

By whom was labor intended to be a curse? From the quotation we infer that it is God. But in the interpretation of the Scripture we are not to derive a universal principle from a single passage, but are rather to inquire what is the general teaching of the Bible on that particular point. Is the general tenor of these teachings in praise or in condemnation of labor? Is it not that labor is a blessing? We hardly believe it to be intended as a curse.

However, I can only think that "O. W. D." has been some time unfortunately perplexed, and may be, so driven by work, day in and day out, as to make her so heartily disgusted with it as to pronounce it a curse. Indeed she has probably had too much to do, judging from her statement that her experience is that men, as a rule, are lazier than women. As we have no statistics on this point, we shall probably have to admit it, and this we would sooner do than believe labor to be a curse and intended as such. J. W.

SPEAK YOUR MIND.

I HOPE no one will be deterred from speaking her mind for fear she will be thought to give personal history every time she comments on some domestic short-coming. I think we are quite as likely to write from the very opposite.

A work on the "Comforts of Human Life" was written in prison under the most distressing circumstances. The "Miseries of Human Life" on the contrary was written in a drawing-room where the author was surrounded by all the luxuries of life.

So the fun-makers of the world are often the gravest or dullest of men in every day life, and Burton, who wrote "The Anatomy of Melancholy," was a very facetious man in conversation.

So, RURAL friends, just say what you please about domestic life in any of its phases, where you think an improvement may be made, and no one will suspect that there is "a guilty husband" behind the scene, or a cross mother-in-law by the chimney corner. An observing person does much in her intercourse with others that she feels calls loudly for redress. She thinks perhaps if she writes it out it may meet the eye of those to whom it may prove a word in season, and so do good in the world. Oftentimes the faults which are most annoying are the result of thoughtlessness rather than premeditated wickedness. If the owners could be brought to "see themselves as others see us," they might be induced to change their methods. Many, too, may find themselves in the border-land and take warning in season. Fault-finding, for the mere pleasure of it, is never profitable, but eye-openers are often very useful.

Indeed we ought all of us to hold ourselves open to conviction and ready for improvement to any extent. Better still when we feel that a course is the right one for us, we ought to try and follow it.

I, for one, learn much from the hints and suggestions that come to us from time to time in our chatting corner. Example goes a long way. When some good woman tells us how she manages, what a spur it gives to others to undertake a similar enterprise. People can lead each other on into good as well as bad ways. I never read over the thoughts from "Every day House" without finding something to my advantage in them, and so of many other articles. OLIVE.

ADVICE TO THE GIRLS.

WHEN a man chooses the profession of law he does not expect to be a musician and a journalist also; he knows that if he would succeed he must devote himself to the one chosen calling. When a woman marries she realizes that in order to reach lofty hights in wife and motherhood, she must sacrifice lesser aims. She must be willing to lay aside the delightful occupations which have made her girlhood pleasant; she must know that from the hour when her baby is laid in the cradle, dressed with loving forethought, to that darker hour when the mature man lies down in his last sleep, that she will give full meaning to the words, Constant care" That her mind once unfettered will be at liberty no more, but is bound by ties stronger than life or death to those who have come to her from out of the great unknown. Wait a while, girls; think it all over before you promise to become wives—to take these duties and burdens upon you. Sweet and satisfying as are the obligations of wife and mother, they are not to be taken lightly. A husband must not be looked upon as a sort of perpetual beau, and children as extremely uncertain and improbable adjuncts. Unless, like Wilhelm Meister, your apprenticeship ended, you reach out of yourself and ask for larger duties, for a wider field of labor, you had better stay at home with father and mother, dignifying the relation of daughter, filling the old established home with a mild radiance which would seem but a dim light in a new one.—New York Post.

LETTER WRITING.

I WAS quite interested in the account of Madge's ten postal cards, which appeared a few weeks ago, as there seemed to be a moral connected with it. Let us remember our absent friends by correspondence, particularly when as grown children we leave the parental roof to make homes of our own.

I knew an affectionate mother who had for many years been busy providing for the wants of a large family so that letter writing and penmanship almost became one of the lost arts. But when her children began to leave her, some of them to settle in distant States, she took time daily to practice with her pen. It was hard work at first for her muscles had become stiffened with hard labor, but she persevered. She used to copy pieces of poetry from the newspapers as an exercise. She said to me one day: "I must hear from the children and this is the best way for me to do it and I do not mind if it does come awkwardly." She gradually succeeded in writing easily and well. One of her daughters showed me some of the scraps that had been written as an exercise, which she had treasured up as a touching evidence of a mother's love. So let us remember the old folks, who in the silence of the old home look often and sometimes long for letters from absent children who are not unloving but unthinking. B. C. D.

CORRESPONDENT'S CORNER.

IN RURAL July 30, "Moss Dale" tells about covering slate frames with flannel; I do not exactly understand how it is done. Will some one please tell me through the RURAL?

A CONSTANT READER.

Keep the kidneys healthy and unobstructed with Hop Bitters and you need not fear sickness. —*Adv.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

THE GARROTE MOUSE TRAP.

ABOUT the year 1820, while our family, in what is now the town of Prospect, Conn., were eating dinner there came a knock at the door of the dining-room and kitchen, all in one, the answer to which was "*Walk.*" This was then and there the customary answer to a knock and it was not uncommon in big families like ours that this welcome was given by half a dozen at the same instant.

In came Mr Farrall, a neighbor whom we all knew, and said to father, "Don't you want to help build a saw mill on a dry stream?"

In the middle of a piece of some thirty acres, used mostly for pasture, was a swale in which grew bullrushes, cat-tail flags and bull frogs and out of which in Spring and wet weather ran a small, muddy stream. Here was where Mr. F. wanted to build a saw-mill. Father declined to invest, but offered to sell the mill site. A bargain was struck, price $30, and the mill went up and there was where the Garrote Mouse Trap was invented and made and scattered all through the Northern States and how much further I know not. It is certain, however, that no dwelling house is completely furnished without it and no hardware store is well stocked that lacks it, and it is to-day just the same as neighbor F. made it; no man ever had sufficient ingenuity to attempt an improvement. Whether the inventor ever got a patent I have not learned, but I am sure that thousands are granted for devices not half as worthy of it.

Years after I left that country I was told of the following incident. An old man, a neighbor of Farrall's, not wise in trap lore, on his return from market at New Haven, fell into company with a young man with a big load of two-inch pine plank. This being quite an uncommon commodity excited the old man's curiosity, and as then and there everybody had a right to know what others were doing, asked what he was going to do with such lumber. "Going to make mouse traps of it," was the reply. For fear he had misunderstood, the question and answer were repeated.

The old man was indignant and gave the young man a severe reprimand for his lack of respect to age. Every one can see that the trap is made from a pine plank. VIELLARD.

Muskegon, Mich.

EXPERIENCE NOTES.

Pickled Grapes.

LATE last Fall I was presented with a large basket of Catawba grapes. Having more than the family wished to eat, I filled several wide mouthed glass bottles with perfect fruit *on the stems*. Bunches that were too large to go in the bottles I cut into small clusters, rejecting any that were soft or shriveled. A teaspoonful of white mustard seed was put into each bottle and hot, not boiling, sweetened, cider vinegar poured in until filled to the brim. A teacupful of white sugar to two quarts of not very strong vinegar was the quantity of sweetening used. The bottles were sealed with several thicknesses of paper and kept in a cool place. These pickles were so appreciated by the members of my own family and friends eating of them, that I shall preserve several pounds of grapes this season in like manner.

Picking Chickens.

After Mary had picked a pair of Spring chickens the other day she apologized for their ragged skin by saying that in Ireland she always wet the chickens first with *cold* water before pouring over hot. This she said toughened the skin and made it less liable to tear; but as I had scalded the chickens she had picked them as best she could, Since then she has tried her method with far better results.

Fly Brushes.

Tired of cutting and fastening paper onto sticks for fly brushes, I looked about for a substitute, when I thought of corn stalks. Happy thought! A half dozen barren stalks three feet long were quickly cut and brought to the house. I put them in the sun for an hour to dry and toughen the leaves before using. Now, no more strips of paper to be picked up or blistered fingers from cutting.

Winter Bouquets.

Quite by chance I discovered that tassels of corn when cut while a greenish-white and before they are entirely out of the sheath, make when dried, a desirable addition to grasses and "everlastings" for Winter bouquets. Suspend the tassels downward until dried. MARY B.

DOMESTIC RECIPES.

Huckleberry Cake.

Two and a half cups of sugar, one cup of butter, five eggs, yelks and whites beaten separately, a cup of milk, a teaspoonful each of nutmeg and cinnamon, two cups of berries, four cups of sifted flour, and two teaspoonfuls of baking-powder sifted with the flour. Cream the butter, add the sugar, then the beaten yelks, the flour and whipped whites alternately, and lastly the berries rolled in flour. Bake in small loaves in a moderate oven.

Baked Tomatoes.

Remove the skins with a sharp knife and cut into thin slices. Butter a pudding-pan, put a layer of fine bread crumbs on the bottom, cover with the sliced tomatoes, season with pepper, salt and bits of butter, and cover with crumbs. So continue until within an inch of the top, having crumbs for the last layer. Cover and bake three-quarters of an hour; then remove cover and brown.

Lima-Bean Soup.

Three quarts of soup-liquor, a quart of Lima beans, an onion, a handful of parsley, pepper and salt. Boil until the beans break. Put through a colander, return to the pot, and serve with bits of fried bread. E. I. V.

Liver and Bacon.

Two pounds of calf's liver, three-quarters of a pound of streaked bacon, one onion, juice of a lemon, pepper, salt and a tablespoonful of flour. Wash the liver, wipe dry and cut into pieces an inch wide and three inches long. Cut the bacon into thin strips and fry; take out and keep hot while the liver is frying. Mince the onion, pepper, salt, and dredge the liver in flour and fry with the onion in the bacon fat. When done take out and arrange the bacon and liver upon a platter. Strain the fat and return to the pan with a cupful of hot water. Thicken with the spoonful of flour, and when it boils up strain in the lemon juice. Pour at once over the liver and serve. KATE B.

Sweet Pickled Peaches.

PARE freestone peaches, place in a jar and pour over them boiling hot sirup made in the proportion of one quart of best cider vinegar to three pints of white sugar. The next day turn off the sirup, heat and pour over the fruit as before. Repeat this each day until the fruit is the same color to the center and the sirup like thin molasses. The last day strew bits of cinnamon and a few cloves over the fruit before pouring over the hot sirup.

Spanish Pickles.

FOUR medium heads of cabbage, twelve good-sized cucumbers, one peck of green tomatoes, three ounces of white mustard seed, ounce of turmeric, six tablespoonfuls of made mustard, three pounds of brown sugar, vinegar to mix well. Let the cucumbers stand in brine three or four days, chop onions, tomatoes and cabbage the day before making and sprinkle with salt. When ready to make take cucumbers out of brine, peel and cut into thin slices. Drain the other vegetables, put all into a kettle with sugar, mustard, turemric, seed, and cider vinegar to cover. Simmer slowly one half hour and then bottle. ECONOMY.

Why be sick and ailing when Hop Bitters will surely cure you.—*Adv.*

A Pleasant Quiet Home in the country, near N. Y. City is in need of a respectable girl to take care of a two-year old child, and to render herself generally useful in the lighter work of the house. Honesty, gentle manners and an appreciation of a pleasant, quiet home indispensable. A companionable person of some education preferred. Address
Box 3318, New York P. O.

News of the Week.

HOME NEWS.

MONDAY, August 22, 1881.

During the week past the bulletins and newspapers have been scanned for the latest news from the President, with quite as much eagerness and anxiety as when he was first shot. On Sunday night the 14th he suffered another relapse, owing to the extreme weakness of his stomach and its consequent inability to retain food. His pulse rose rapidly to 130°, which, with vomiting and nausea, made even his attendants fearful as to the result. He was so low on Monday night that all hopes of his recovery were, by some of his attendants, given up, and the general impression upon the public who waited in suspense for the bulletins, was that his recovery was impossible. However, the slight nourishment he was able to take aided him much in passing this—another one of those terribly critical points in his case. The physicians did not attribute the relapse to the wound, which was doing exceedingly well they thought, but the whole trouble originated with stomachic weakness. On Thursday the 18th, another complication was added to the President's case in the inflammation of the parotid gland, the principal salivary gland situated beside the front and lower portion of the ear. The swelling which was very painful, was caused, it is thought, by putrescent matter in the blood, which, if true, is a very discouraging symptom.

LATER, Monday. 8. A. M.—Up to Saturday morning there was considerable cause for encouragement concerning the President, but on Saturday night he did not rest well and the swollen gland caused considerable annoyance, the accumulations of phlegm producing much discomfort. At noon, on Sunday, vomiting again took place, caused, it was thought, by the effort to eject the phlegm. He vomited twice during the afternoon and as a result was much weakened. Dr. Bliss does not contemplate any serious result from the swollen gland, and is as confident as ever of the President's ultimate recovery. Mrs. Garfield still keeps up great courage and has faith he will survive the terrible ordeal. At midnight of Sunday the annoyance from the gland was reported much less, and there was no further trouble from the stomach.

LATEST—11.30 A. M.—The President has not vomited since yesterday afternoon and this morning has twice asked for and received a small quantity of liquid nourishment. He slept well during the night and this morning his condition is considered a little more favorable.

The Mrs. Garfield fund now amounts to over $155,000 subscribed.

The American Association for the Advancement of Science is in session at Cincinnati, Ohio. Many of the leading scientists of the country are present.

Leo Hartmann, the Russian Nihilist, who lately left the United States for Canada through fear of extradition, has returned and has declared his intentions of becoming a citizen of the United States and on the 18th received a certificate to that effect from the Clerk of the Superior Court in this city.

Secretary Blaine has extended an invitation to the descendants of Baron Steuben in Germany, to attend the centennial anniversary of the surrender of Lord Cornwallis at Yorktown. Baron Steuben was an eminent German soldier who tendered his aid in the war of American Independence and joined Washington at Valley Forge in 1778. The descendants of Lafayette have also been invited.

The Castle Garden officials report the continuance of an urgent demand for help, and say Rhode Island, New Jersey and Connecticut are absolutely begging for weavers in silk, cotton and woolen goods. Skilled hands command high wages. Children will be taken and taught the trade of weaving. Farmers, molders, railroad workman, and for that matter, men and women in all branches of industry, are wanted

The members of the Cornell Univ. crew have returned to London, having abandoned the idea of rowing a race at Frankfort, and will embark for home in the National line steamer Spain, which sails from Liverpool on the 24th inst. for New York. They accuse their stroke, Shrinkel, of having sold the last race they lost against the Vienna crew.

A feature of the Atlanta Cotton Exhibition will be the making of a suit of clothes from raw cotton in twenty-four hours. The cotton will be picked, ginned, spun, dyed, woven and made into a suit of clothes for Senator Brown inside of one day.

John H. Horton, of the Syracuse Journal, John J. Flanagan, of the Utica Herald, and Dewitt G. Ray, of the Utica Observer, saw Greenfield hung. It was Ray's fifteenth, Flanagan's twenty-third, and Horton's twenty-fifth hanging. What a lot of ghouls!

President White of Cornell University, telegraphs from Berlin that he has secured Dr. Edward Augustus Freeman, the distinguished English historian, as a non-resident Professor for Cornell University. Dr. Freeman is conceded to be the ablest and most eminent historical writer now using the English language. His masterpiece is the "History of the Norman Conquest," in five volumes. He is the author of some 20 historical works accepted as authorities.

The sudden change in the temperature has been felt keenly at some of the "shore" resorts. The Providence Press of Tuesday says: "The Summer residents on the Massachusetts and Maine coasts think that Winter has come to-day. Over coats and coal stoves are at a premium."

Three children in one family died on Wednesday last in President, Penn., under peculiar circumstances. Two of them while playing in the yard, were bitten by snakes. Their mother, going to their assistance, left a kettle of boiling water on the floor, and the third child fell into it.

Dr. S. A. Boynton, writing August 12, tells how the president is nursed: In regard to nursing, we have things well arranged now. Mrs. Edson takes him one night until 3 A. M., and General Swaim follows her and remains with him until Mrs. Edson's return some time during the day, and then she and I take turns staying with him until 3 A. M., then Colonel Rockwell follows me and remains until 7 A. M., when I again take him, and so it goes day after day and night after night.

The Commissioner of Pensions is considering the advisability of recommending congress to pass an act pensioning the Union soldiers who were in the rebel prisons any length of time. The commissioner holds that the constitutions of many men were wrecked and more injury done their usefulness in thousands of cases by starvation in prison pens than by service in fields or wounds received in battle. The commissioner is investigating what such an act would cost the government annually.

Professor A. R. Leeds, of the Stevens Institute of Technology, has been analyzing the aqueduct waters of many cities. The order of purity was found to be: 1, Brooklyn; 2, Philadelphia; 3, Baltimore; 4, Washington; 5, New York; 6, Hoboken Jersey City, and Newark; 7, Oswego; 8, Wilmington; 9, Boston.

After legacies to his widow and relatives, Matthew Vassar's will makes the following among other bequests; To Vassar College; for scholarships and educational funds, $50,000; for Vassar College professorship, $80,000; Vassar Brothers' Home for Aged Men, $15,000; Vassar Brothers' Hospital, for grounds and buildings, $75,000; furniture and fixtures for the same, $10,000; the Poughkeepsie Young Men's Christain Association $3000.

Lord Lorne, Governor General of Canada, and suite, are traveling through the great Northwest. They camp among waving fields of grain, and hold frequent "pow-wows" with the Indians. We advise the Governor to keep an eye on his scalp.

Guiteau, the assassin, attacked one of his keepers in jail on the 17th inst., and inflicted some wounds with a sharp piece of steel which he had obtained in some mysterious way. The struggle lasted some five minutes or more. It was not an attempt to escape but simply one of Guiteau's "insane" freaks.

Money Saved.

A gentleman in Louisiana, who sent for Compound Oxygen for his daughter, writes: "She is in better health now than ever before. I consider her completely restored." He then adds: "I purpose keeping constantly on hand your Compound. *I have saved in actual cash not less than fifty or one hundred dollars since I commenced its use last August. No purchase of medicine, no call of physician. I consider its use a matter of economy.* Our Treatise on Compound Oxygen, its nature, action and results, sent free. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

AGRICULTURAL NEWS.

EX-SENATOR Dorsey, the grand jury at Santa Fe has just found, holds a large portion of his New Mexican estate of 12,000 or 15,000 acres on a title which runs back to a large number of fraudulent entries. The land is highly valuable for its control of the water-supply of a large region, and was taken up, in part at least, under the desert land acts. These limit each person's entry to one square mile, too small an extent to be held with profit by any one person in the case of true desert lands, and larger tracts are taken up in almost every instance by collusive entries, sometimes wholly fraudulent, and nearly always outside of the spirit of the law, even if within its letter. In Dorsey's case, his character leads to the worst conclusion.....The last N. J. Legislature went wild on sugar bounties and voted a bounty of a cent a pound on beet-sugar and $1 a ton on the sorghum cane from which sugar is made. As a fertile acre will yield from 15 to 20 tons of cane, the bounty is likely to cost the State a pretty penny before it can be repealed.....It is conceded that India can grow better tea than China. Since 1860, when the imports of Indian tea to England first reached 1,000,000 pounds, the growth of the trade has been rapid and continuous. At the end of the first decade, in 1870, the quantity imported was 13,000,000 pounds, while last year, at the close of the second decade, the imports were 45,000,000 pounds, of the estimate value of $15,000,000. The area of land now under the plant is over 200,000 acres, representing an investment of British capital to the extent of $75,000,000, and giving employment to a population of over a quarter of a million souls. The crop of tea this year is not likely to be less than 50,000,000 pounds..... From all parts of British Columbia good crops and bountiful harvests are reported. Vancouver's Island has been particularly favored, little or no unseasonable weather having occurred. The largest crop ever raised on the island will be harvested this season.....A commissioners' sale of 100,000 acres of land lying in Harlan and Bell counties, Ky., is advertised to occur at Mt. Pleasant, Harlan county, Ky., September 5th.

A man in Sonoma County, Cal., has sold over $700 worth of carp this year from a pond covering less than an acre of ground, and has 20,000 fish of various sizes remaining.....A correspondent of the San Antonio (Texas) Press, who recently visited the Rev. W. H. H. Murray's Texas farm, says he has on his place half a dozen horses worth $60,000. It has been generally believed that orchard fruits will not thrive in Texas soil, but Mr. Murray has succeeded in raising apples, pears and peaches in abundance..... Ireland will have, if reports are true, an excellent harvest this year. An unusually large area of the Island is under cultivation, and the outlook has not been so favorable for good crops since 1872. The tillage in Leinster comprises a million and a half of acres and the barley there is fine, while the hay crop is the most abundant on record. Hay is also a large crop in Ulster, and much of it will probably find its way across St. George's Channel, to supplement the falling off in the English production.....The Shetland wool trade owes its existence entirely to Sir John Sinclair (father of Catharine the novelist) about the most useful man Scotland produced in the last century. He founded a "Society for the Improvement of British Wool," and in one year collected 800 sheep of all sorts of breeds from different countries, to see which would best answer wool purposes..... Exports of wheat from California for the year ending July 30, 1881, reached a total of 18,367,767 centals, valued at $19,023,615, showing an excess in quantity, when compared with the same period of 1879-80, of 2,842,353 centals, with an increase in value of $3,027,110. The exports of barley amounted to 1,289,498 centals, of the value of $1,534,475, an increase of 655,859 centals, of the value of $748,434. Then there were 662,023 barrels of flour shipped for the period given, an increase of 169,338 barrels, the respective values being $2,911,006 and $299,956. Of the wheat exports 8,661,093 centals were shipped and were delivered in Europe; of flour, 151,179 barrels, and of corn, 17,945 centals. In the course of the twelve months 358 vessels were dispatched from San Francisco with grain cargoes, the foreign making 234 and the American 124, and of the former number 185 carried the British flag.

Mr. Clare Sewell Rand, a high practical agricultural authority in England, told the Chamber of Agriculture of England's leading agricultural county, Norfolk, lately, that even if all local taxation were abolished, they could not live. All taxes had increased during the last thirty years, although the price of grain was lower. Unless rents are reduced a separation must take place between landlord and tenant. This distress, he averred, was the outcome of free trade, which other countries had not adopted. He thought that England would be absorbed by America, or perhaps become the harbor of the world, and Englishmen become, like the Dutch, mere hucksters.....

BREADSTUFFS.

THE AGRICULTURAL DEPARTMENT REPORT of the condition of the Corn, Oats, Rye and Clover crops on July 1, 1881, is as follows. The report on wheat we gave in advance in the RURAL for August 13.

* Compared with last year.

William Dunbar is a swindler. Last Friday he was arrested at Watertown, N. Y., charged with using the United States mails to carry out a scheme of fraud. Lately he has been flooding the country with letters soliciting one-dollar advertisements for Dunbar's National Hotel and Pleasure Resort Directory and Dunbar's National Stock-breeders' Directory and Register, neither of which publications exists.

The program of the National Fair Trade League which will shortly commence an active campaign against free trade in England has been issued. The League demands that there be no renewal of commercial treaties, unless terminable at a year's notice; that imports of raw materials for home industries be free from every quarter; that adequate duties be levied on the manufactures of foreign States refusing to receive British manufactures in fair exchange, and that the same be removed in case any nation agrees to take the British manufactures free of duty; that a very moderate duty be levied on articles of food from foreign countries, the same being admitted free from the colonies and dependences which are prepared to take British manufactures in a reasonably free interchange.

The last lengthy paragraph is aimed directly against this country on account of its protectionist policy; and urges that all efforts should be employed to foster the agricultural and other industries of the British colonies and dependencies by sending them emigrants and buying their products rather than aid in building up rivals by dealing chiefly with the United States.

$40 Rifle for Only $15.

The Evans 26-shot Sporting Rifle, advertised by E. G. Ridout & Co., 10 Barclay St., is a great bargain. We are positively assured that the retail price of these Rifles was $40 each; any one can get the same Rifle now, by sending to the above-named firm only $15. They offer to refund the money sent if the Rifle is not as represented. Read their large advertisement in this issue.

Suffer no More.

If the bowels are torpid, if piles torment, if the back is full of pain, get a package of Kidney-Wort and be cured without more suffering. It can be bought of all druggists in either dry or liquid form.—Republican.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

Write to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets relative to the curative properties of her Vegetable Compound in all female complaints.

The vigor of youth for the aged and infirm in Hop Bitters.

Premature Loss of the Hair.

May be entirely prevented by the use of BURNETT'S COCOAINE.

HOUSEKEEPERS should insist upon obtaining **Burnett's Flavoring Extracts**, they are the best.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, August 20.

Chicago.—Grains were all active, at times excited, and generally strong and higher, but very unsettled under encouraging Eastern and cable advices. The fluctuations were heavy and frequent. WHEAT—No. 2 Chicago Spring, $1.34, cash and August; $1.24½@$1.24½, September; $1.25½@$1 26, October; $1.26½, November; $1.24@$1.24½ all the year; sales quiet at $1.34 cash and August; @$1.23½@$1.26½, September; $1.24@1.27½, October; $1.24½@$1.29, November; $1.22½@$1.25½, all the year; No. 3 Chicago Spring, $1.10@$1.14; Rejected, 82c. Corn, 63½c., cash and August; 63½c.@63½, September; 65½c., October; 65½c., November; 63½c., all the year; sales 62½@64½c., cash and August; 62½c.@65½c., September; 64c.@67½c., October; 61½@64½c., all the year; Rejected, 60c. OATS 39½c., cash; 39@39½c., August; 39½c., September; 40½c., October; 40½@41c., November; 38½c., all the year; sales at 39c.@40c., August; 38½c.@40½c., September; 39½c.@41½c., October. RYE strong at $1.01½. BARLEY strong at 97c.@97½c., September. PORK strong and higher, but unsettled, at $18.25, cash; $18.10@$18.15, September; $18.35@$18.40, October; $17.80, all the year. Lard strong, but closed weak and lower at $11.55, cash; $11.55@$11.67½, September; $11.67½@11.70, October. Bulk-meats moderately active and higher. Shoulders, $7; Short Rib $9.55; Short Clear, $9.70. SEEDS.—Timothy strong at $2.30@2.65, in store; $2.47½@$2.50, August; $2.40@$2.45, September. Clover strong at $4.50@$5.20. Flax strong at $1.32. BUTTER firm; packing advanced ½c. EGGS quiet at 15@15½c. for strictly fresh. CHEESE steady, with a good demand, but nominally unchanged. HOGS—Market active and stronger; mixed packing $5.85@$6.35; choice heavy, $6.50@$6.90; light, $5.40@$6.75; culls and grassers, $3.75@$6.20. CATTLE—Prime in sharp demand; poor very dull; exports, $6.20@$6.50; good to choice shipping, $5.60@$6.10; common to fair, $4.50@$5 25. native butchers', $2.50@$4 20; stockers and feeders, $3@$3.90; range cattle active and firm; Texans, $3@$4; canning mainly at $3.20@$3.50. SHEEP—Market dull and weak; common to medium, $3.50@$3.75; good to choice, $4.20@$4.60.

Cincinnati.—WHEAT declined 1c. since yesterday; No. 2 Red Winter, $1 38@1 39. CORN unsettled and irregular; buyers and sellers apart; No. 2 Mixed, 68c. OATS dull; No. 2 Mixed, 43c. RYE in good demand and prices a shade higher at $1 13. PORK nominally; unchanged; held at $20. Lard dull and neglected; unchanged. Bulkmeats quiet; Shoulders, $7 35; Clear Rib, $9 80. Bacon in good demand at full prices; Shoulders, 7¾c; Clear Rib, $10 35; Clear Sides, $11. BROOM CORN is not very active, but there is a steady order demand from manufacturers and prices are well sustained. Choice hurl is selling at 7½@8c, medium do. at 6½@7c, carpet brush at 7@7½c, prime green stalk braid at 6@6½, red tipped at 5½@6c, and crooked brush 3½@4½c ₱ lb. HEMP—There is little demand, but with a light supply prices are well sustained. Rough Kentucky sells at $130 per ton from store. Single dressed sells at 8@8½c and double do. at 9@10c ₱ lb, from store.

St. Louis Mo., Aug. 20.—WHEAT very excited and unsettled; opened higher, broke badly, but partially recovered at the close; No. 2 Red Fall, $1 34, cash; $1 36, September; $1 39½, October; $1 42, November; $1 43¾, December; $1 34, all the year; No. 3 do., $1 27, No. 4 do., $1 18½. CORN the same in tone as Wheat, but decline greater at 63½c., cash; 64c., September; 66½c., October; 67½c., November; 67½c., December; 63½c., all the year. OATS 37c., cash; 39½c., September; 41½c., October; 47½c., November; 44c., December; RYE higher at $1 10 bid. PROVISIONS—Job trade only. HOGS quiet; Yorkers and Baltimores, $6 30@$6 55; packing, $6 10@$6 50; choice to fancy heavy, $6 60@$6 85. CATTLE—Supply light; native butchers' Steers, $5 50@$4; Cows and Heifers, $2 50@$3 75; grass Texans, $2 50@$4, latter for choice; native shipping tops wanted at firm prices. SHEEP scarce and in urgent demand; fair to fancy, $3 25@$4 50. BUTTER—Creamery at 23@25c, for ordinary to 26@27c. for choice; Dairy, choice at 20@21c, in lots to 20@23c. for selections, prime 16@18c, low to fair 11c, to 15c. Ladle-packed and country make in pails nominal at 10c. to 16c. HEMP—Common Un-

dressed plenty and dull at $70 to $90, good to choice in light supply—quotable at $95 to $110; Dressed $115 to $165; Shorts $115 to $125; Hackled Tow $50 to $55. EGGS—Fresh scarce, and in light local demand, at 5@9 c. to 11c. candled. GRASS SEEDS—Timothy in demand and firmer. Prime New quotable at $2 50@$2 70; 103 sks fair (not clean) sold at $2 40. Other seeds neglected. CASTOR BEANS—None offered; prime in car lots, would probably bring $1 55. HEMP SEED—Nominal, at $1 10@$1 15—recleaned held higher. FLAXSEED—Easier at $1 20, pure test.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug. 20, 1881.

BEANS AND PEAS.—A good home and export demand for medium and marrow has advanced prices. Mediums are so scarce that local buyers have been forced to use some marrows; this fact helps white kidneys. Pea almost out of the market. Red kidneys doing a shade better. New crop white will be wanted early this year, but that is no reason for hurried or imperfect curing. Green peas quiet at $1.40@1.45 for Wis. in bbls.

Marrow beans, prime, $2.45@2,50; other, $2.35@2.42½; medium, choice, $2.35; other, $2.40@2.45; pea, $2.60@2.90; white kidney, $2.30@2.47½; red kidney, prime, $1.65@1.67½; fair to good, $1.40@1.55; black or turtle soup, $1.25@1.35.

Receipts for week, 27,781 bush.
Exports do. 1,085 bbls.

BUTTER.—The Market has had an unusually active term for August and the strong rates for last week have been more than supported. The demand is chiefly for fine State stock, and, in the absence of creamery, selected half tubs have obtained a good deal of trade. Exporters have taken quite a number of lots but not at the later range of rates. At the close the local call is not quite so sharp: when butter nears 30c. wholesale, there is always more or less curtailment in use. Still receipts are light—a favorable feature for sellers—and no great break will occur before supplies enlarge. Western is selling well: fine fresh dairy and ladle-packed June is steadily sought for by the medium class of buyers. Common styles of Western are neglected. Fall receipts from the West will, it is thought, show considerable falling off compared with former years, and speculative holders of all stock are encouraged by the possibility.

Creamery, choice Western, 26@27c; do. State and Pa. 27½@28c; prime, 24@25c; poor to fair, 20@23c.; sweet cream 25@26c.; State pails and half tubs, choice 25@25½c; good to prime 23@24c; fair to good 22@23c.; Welsh tubs, fair to choice, 22@26c.; State dairy, poor to fair, 20@22c; firkins, 22½@24½c.; Western imitation creamery 17@23c.; dairy, fresh, 20@22c.; other 14@18c.; factory, Iowa, June, 18@19c.; other 14@17c.; very poor 11½@13c.

Receipts for the week 31,329 pkgs.
Exports do. 6,686 do.
Refrigerator room 90s. per ton to England.

CHEESE.—There has been a fairly sharp demand and prices have responded with a daily advance to their present point. Nothing of account is left over, but liberal supplies are due next week, and as many prominent shippers are away prices close with tameness.

State fact'y, fine, colored, 11½@11¾c. do. white, 11@11¼c; good to prime, 10½@11c; fair to good 9¾@10¼c; poor to fair 9@9¼c; Ohio, cheddar, fine 10@10½c; other 9¼@9¾c.; flat, fine 10c; other 7½@9¾c.; partly skimmed, 4@7c.; full skimmed 2½@3c.

Receipts for week, 109,368 boxes.
Exports for week, 85,954 boxes.

Steam to Liverpool, 30@35s.

COTTON.—The market has ruled weak and uninteresting and there are no points which have any special bearing upon the market for the moment. There is an increase of cotton in sight and that fact gives assurance to dealers in spot stock. Liverpool seems to be following the New York market.

Quotations are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—There is no trade to note in apples and holders are unwilling to depart from their late views to bring out trade. Peaches are scarce even with the additions of new that come forward. Small fruits are quoted on the rates that might be realized for moderate supplies of new crop.

Apples, evaporated rings, choice 12c.; prime 11@11¾c.; fair to good 10¾@11c; Southern in bbls. 4¾@5¼c.; do. in bags, 4¼@5¼c; State fine cut 6¾@6¾c.; quarters choice, 6@6¾c.; small lots 5¾@6c; Ohio and Mich. 6@6¼c.; Western, fair to good, 5¼@5¾c; evaporated peaches peeled 33@35c.; N. C. do. 19@25c., Ga. do. 17@23c.; State 17@19c.; old poor to prime 12@18c.; Tenn. halves 7¼@7¾c.; unpeeled ₩ qt. 7@7½c. Plums State, black, 15@17c. Blackberries, 11@11¾c. Cherries, 21@21½c. Raspberries, prime 37@38c. Whortleberries, prime 12½c.

Receipts for the week, all kinds, 860 pkgs.
Exports dried apples, 123 pkgs.

EGGS—Receipts for week, 7,355 bbls.; do. last week 6,484 do. Business begins to run satisfactorily; that is, the bulky portion of the supply of Western have regained their customary demand and prices are quoted with strength for all fine marks. With a scarcity of State and fancy near points, Canadian are firm for best class of trade.

Near points 21c., State and Pa. 20@20½c; Canadian 19@19½c.; Western, 19c.; poor lots 17@18c.

FLOUR.—During the later high ruling phases of wheat flour went up to present rates, and all useful brands are quoted firm at the new rates. A good trade has kept up, especially for the trade brands, as buyers feared that stock might go out of reasonable reach in the grain excitement. Exporters have bought very liberally, the shipments being quite equal to the receipts.

No. 2, ₩ bbl., $3.75@4.50; State and Western superfine, $4.75@5.40; city mills extra, $6.85@7.25; Spring wheat do. $5.50@5.85; Spring XX and XXX, $6.00@6.25; patents, $7.00@8 50; Ohio round hoop shipping, $6.00@6.40; trade brands, $6.50@7.25; St. Louis extra, $6.25@6.60; do. double extra, $6.75@7.15; do. family, $7@7.50; South'n ext. shipping, $6 40@6.85; do. XX and family, $7@7.50. Rye, superfine, $5.50@. Corn-meal, Brandywine, $3.85@4; Western, $3.05@3.75.

Receipts for week, flour 96,650 bbls.; corn-meal do. 6,500.
Exports for week, flour, 95,000 bbls.; corn-meal do. 5,925.

FRESH FRUITS.—Apples scarce and firmer, Pears plenty and prices low, especially for green Bartletts. Peaches have wide range but no trade in making outside rates for fine pickings. Prices for choice as high now as during the week. Plums scarce. Grapes plenty but slow. Melons lower: cool weather always checks melon trade.

Apples, Nyack Pippin ₩ bbl. $2@2 25; Orange do. double-head $1.50@1.75; single head $1.25@1.50; Codling $1.50@1.75; Red Astrachan $2 50@3; Windfalls 75c @$1. Pears, Bartlett J'y single heads $2.50@3.50; up-river ₩ bbl. $3@4; Clapp's Favorite $3@3.50; Flemish Beauty, up-river, $2.50@3.50; Jargonelle $1.50@2; Tyson $2.50@3.50; cooking $1.50@2; Grapes, Martha, Va. case of 18 2-lb. bxs, $4@4.50; Del. do, $4.50@5.00; Ives do. $2.50@3; Concord, do. $3@3.50; do, N. Watermelons, Norfolk prime ₩ 100 $12@16; Md. selected $15@20, culls $5@10; Jersey Negro-head $12@16. Nutmeg melons, Jenny Lind Jersey ₩ bbl. $.50@2; Keyports $1@2.50; Huckensack $3.50@4; Peanuts Va. hand-picked ₩ lb. 5½@6¼c.; do. fancy 5¼@5¾c.; do. extra prime, 5½@5¾c.; do. good to prime, 4¾@5¼c.; shelled, 3¾@4½c. Pecan nuts, ₩ lb 7@9c.

A sample of Summer oranges has been shown in New York. Some Indian River growers intend to introduce them into this city if possible and they would be a desirable addition to the fruit list. Foreign oranges that are sweet are apt to be thick-skinned and of very bitter juice.

GRAIN.—The week has been marked as one of intense speculative and spot activity. On 'change there has not been a single quiet period, and dealers have utilized all of session time allowed from morning till night, and many operations transpired after the close of 'change. The sales for the week of wheat foot up 13,300,000 bush., or more than 1,500,000 compared with last week; corn sold something larger than last week, adding up 6,574,000 bush. Oats have been heavily dealt in: sales for week 2,044,000 bush.; do. last week 1,185,000 bush. Wheat shows an important advance. Corn is much higher, and some parcels of S. & W. white oats have made a big jump compared with seven days ago. Rye has sold well into its stock.

Wheat, Spring $1.20@1.35; do, No. 2 $1.32@1.34; do. No. 3, $1.25@1.37; red Winter No. 2, $1.44@1.45½; red Winter $1.35@1.43; white Western and State $1.35@1.41. Rye, 90c. Oats, white No. 1, 52c.; white No. 50c.; white No. 3, 47c; mixed No. 1, 47½c; do. No. 2 46½@47c; do. No. 3 44@46c. Corn, Western mixed 65@75c.; do No. 2, 71@75c.; do. yellow, 73@75c.; do. white 72@78c; Southern white 75@78c.; do. yellow 75@76c.

Receipts for week, wheat, bush., 801,612,; corn, do 763,100, oats do, 1,025,438; rye, do. 4,196; malt, do. 45,600; rice pkgs. 729.

Exports for week, wheat, bush 1,645,581; corn, do. 1,267,630; oats, do. 43,159. rice, pkgs. 879.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports and on rail, on lakes, on canals and on Mississippi River:

	1881. Aug. 13. bush.	1880. Aug. 15. bush.	1879. Aug. 17. bush.
Wheat	17 405,069	14,179 091	16,026,837
Corn	16,045,101	17,363,832	12,140,032
Oats	7,259,348	1,330,783	1,605,031
Barley	104,784	169,757	306,311
Rye	298,748	432,718	493,906
Total	41,113 630	33,505,181	30,572,117

HAY AND STRAW.—Hay has weakened under heavy receipts and stock has begun to accumulate. Old straw scarce and firm; new dull.

Prime retailing timothy hay, 85c. ₩ 100 lbs.; medium do. 60@70c, do.; shipping grades 50c. do.; clover mixed 50@55c.; pure 40@45c. Straw, long rye old 85@90c; do. new 65@70c.; short rye old 65@70c.; oat and wheat 40@45c.

Exports of hay for week 2,980 bales, some of which are for Great Britain.

HOPS.—Brewers, the chief buyers at the moment, are taking very light quantities and prices are about nominal; not much animation expected until new are pickable. A few fancy new hops have brought 25@30c.

Crop of '80, choice, 20@22c; good to prime, 16@18c; fair to good, 14@16c; poor to fair, 11@14c; Eastern, 16@17c.; '79's, fair to prime, 12@15c.; '78 5@8c.

Receipts for week, 571 bales.
Exports for week, 122 bales.

RICE.—The demand is active for domestic, with an advance of fully ¼c on high grades. We quote—

Carolina and Louisiana, common to fair 4¾@5¼c; good to prime 5¾@6¾c.; choice 6¾@7¼c.

SALT—Quotations are—

Ashton's $2.50; Higgins's $2.40; Holmes's extra sifted $2.40; Deakin's $1.25; Evans's $1.20; Washington's $1.20; Marshall's $1.25; Verden's $1.20; Worthington's $1.20; Mediterranean 25c.

SEED—Clover seed is quiet; quoted at 7¼@8c. Linseed is dull; quoted at $1.85. Timothy has a small demand; quoted at $2.30@2.90. Flax-seed is firm and in demand; quoted at $1.28½@1.30 to arrive.

SUGAR—Refined is quoted

Cut loaf 10¾c.; crushed 10¾c.; powdered 10¼c.; granulated 9¾c.; mould A 9¾@9¾c.; confectioners' A 9¾@9¾c.; standard A 9¾c.; off A 8¾@9¼c; white extra C 8¼@8¾c; yellow extra "C" 7¾@8¼c.; C 7¾@7¾c; yellows 6¾@7¼c.

TOBACCO.—Western crop reports are discouraging, and the market for all leaf and seed is tending higher. Some holders have withdrawn their stock from present sale. The demand for consumption is brisk. Hhds are still selling to fill further continental orders.

POULTRY AND GAME.—It has been another favorable week for dressed stock of all kinds, but at the close prices are not running so closely to the extreme. Turkeys scarce and wanted. Spring ducks are a good feature when game is scarce as it is apt to be at this season.

Turkeys, Phila. prime ₩ lb 20@21c.; State & Western d. p. 19@20c.; scalded 18@19c. Chickens, Phila. prime 23c; Bucks Co, 22@23; N. J. 20@22; State & W'n sp'g 18@21c, Fowls, Phila. d. p. 16@17c. Bucks Co. 15@17c; N. J. d. p. 16@16½c; do. scalded 15@16c.; State and Western d.-p. prime 15@16c.; do. scalded 14@15; do. coarse —@——c. Ducks—Spring, Phila. ₩ lb. 18@20c; J'y & Bucks Co. 18@20c. State 13@14c; old. 12@14c. Squabs, white ₩ doz. $2@2.12; do. dark, $1.50@1.75.

Receipts of cooped stock have run light and the week shows good prices. Fowls and turkeys have done the best, but chickens have ruled very steady

Chickens, J'y ₩ lb 17@18c. State & Pa. 15@17c.; Western 15@16c; Southern 15c. Fowls, Jersey, State and Pa. 14@15c; western 13½@14c; southern 13c.; roosters, 6@8c.; turkeys, Jersey & Pa. 16c.; other 15@16c; ducks, Jersey, N. Y. and Pa. ₩ pair 80@87c. Western 50@65c; Southern 45@50c; geese, J'y $1.60@1.75; N. Y. & Pa. $1.25@1.37; Western $1,12@1,25; Southern $1@1,25. pigeons, 25@30c.

Woodcock are plentier but the demand uses them all at good prices.

State quoted $1.37@1.50; Western $1,25@1.37; Eng. snipe & plover $1.75@2 ₩ doz.; no more pigeons expected. Frogs legs 30@40c.

PROVISIONS.—The hog products continue to be controlled by a strong speculative element. A leading prop to the high views of operators is the accepted report of a light crop of hogs, a reduced corn crop also having its influence. Exports are of no account compared with former years.

Pork extra prime, ₩ bbl. $14@14.50; Western mess, new, $18@18 25. Lard, steam West'n ₩ 100 lbs, $11.70@11.75; prime city, $11 55. Hams, smoked city ₩ lb 12¾@13c; pickled Western and city 11½@12c; Shoulders: smoked city, 8¼@8¾; pickled, 7¾@7¾; rib bellies, pickled, 9¾@10¼ Bacon, long clear, west. 9¾@9¾c. Beef, western mess, ₩ bbl., $11@13.50; India mess tcs. $26@27.50; beef hams bbls. $11@23.

Receipts for week—Beef, bbls and tcs. 930; pork, bbls. 1,550; Cut meats, pkgs. 22,300; lard, do 9,800.

Exports—Beef, bbls and tcs. 2,575; pork, 4,050; cut meats lbs. 8,601,612; lard, do, 3,659,772.

VEGETABLES.—There is a strong market for prime potatoes: Albany and Troy are sending some, but they do not sell at full prices as L. I. absorbs the demand on account of fine quality; the range is $1.65@2 ₩ bbl. bulk. Garden stuff is active, as there is no surplus of fine produce; prices generally firm—an unusual thing at this season.

Green corn, prime 75c@$1 25; other 40@50c; wax beans L. I. ₩ bag $1.50@2; string beans $1.50@2; Lima beans; potato, $1.25@1,50; flat 75c@$1; cucumbers, ₩ 100 75c@$1.25; do pickles, $2; egg plant ₩ doz. 50@75c; do. Phila. ₩ bbl. $1.50@1.75; Tomatoes L. I. ₩ bush. 20@35c; squash marrow ₩ bbl. $1.25; do. white 75c@$1; do. yellow, $1.25@1,50; cabbages, ₩ 100, $3@5. beets 100 bchs $1.50@2; onions, white ₩ bbl. $3@3 50; yellow $2.50@3; red $2; Chester $1@1,50; carrots ₩ 100 bchs $1@1,50; turnips Russia ₩ bbl, 75@$1; okra ₩ 100 15c.

LIVE STOCK MARKETS.

NEW YORK, Saturday Aug. 20, 1881.

BEEVES.—Receipts for the week 13,769 head; do last week 12,585 do. The offerings have been largely made up of common and medium steers and, prices in the bulk are easier than on Wednesday last. A few car-loads were left over, but it was thought at the close they would be placed before fresh receipts arrived heavily. Texans sold at 7@8¾c, to dress 55 lb, less 50c. per head; Colorados 7½@8¾c. to dress 55 lb; poor to prime ranged 8¼c, to dress 55 lbs. to 12c, to dress 57 lbs.

MILCH COWS.—Supplies small; prices range $35@60 per head; sales mostly at $35@45.

VEAL CALVES.—All calves have run in light supply this week and prices are firm for every grade, even grassers. Up-river calves have found a place at 12@13.

Live N. J. prime to choice, 8¼@8½c; do, State, 8@8¼c.; poor to good 6@7¼c.; Mt. Hollys, 7@8c.; buttermilk, &c.; grassers 4@5c.

SHEEP AND LAMBS.—Receipts for the week 32,066 head; do. last week 32,761 do. Trade has run light but fair, the demand running on best stock. Sheep ranged 4¾@5½c, common to prime, Southern lambs 5¾@5½c; N. J. 6¾c. State 6¼@7¼c.

SWINE.—Receipts for the week 15,542 head; do. last week 18 838 do. Live quoted $6 75@7 ₩ 100 lb; steady. N. J. pork, medium to light, 9@9½c; city dressed, heavy to light, 8¾@9c.

DIED:

KANE—At Erie, Pa., Aug. 13th, of cholera infantum, EMMA ELSIE, only child of WM. H. and FANNIE REED KANE, aged 15 months.

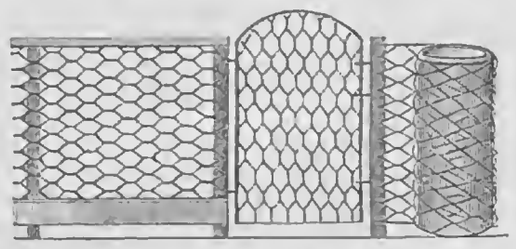
PROFESSOR HORSFORD'S PHOSPHATIC BAKING POWDER

Made from Professor Horsford's Acid Phosphate.
Recommended by leading physicians.
Makes lighter biscuit, cakes, etc., and is healthier than ordinary Baking Powder.
In cans. Sold at a reasonable price.
The Horsford Almanac and Cook Book sent free.
Rumford Chemical Works, Providence, R. I.



The Sedgwick Steel Wire Fence

Is the only general purpose wire fence in use. Being a strong net-work without barbs, it will turn dogs, pigs, poultry as well as the most vicious stock, without danger to either fence or stock. It is just the fence for farmers, gardeners, stock-raisers, and railroads; very desirable for lawns, parks or cemeteries. As it is covered with rust-proof paint it will last a lifetime. It is superior to boards in every repect, and far better than barbed wire. We ask for it a fair trial, knowing it will WEAR itself into favor. The SEDGWICK GATES, made of wrought iron pipe and steel wire, defy all competition in neatness, lightness, strength and durability. We also make the BEST and CHEAPEST ALL IRON Automatic or SELF-OPENING GATE. Ask hardware dealers, or for price list and particulars address
Sedgwick Bros., Richmond, Ind.

The Herald of Praise.

Send on your Orders for this New Book for Choirs, Conventions and Singing Classes.

It is the work of L. O. EMERSON, of whose previous books of sacred music about half a million copies have been sold. So that the issue of a new Church Music Book by him is a notable event. Judging by previous experience, as many as a hundred thousand persons are to use this, the last and best compilation, filled from cover to cover with new, fresh, interesting, practical music and words. Specimen copies mailed for $1.00. The usual reduction for quantities.

THE IDEAL is a companion book to the HERALD OF PRAISE, and is intended for Singing Classes only, with no reference to choir singing. The contents are similar to those of the excellent HERALD, but matters are condensed, and whatever is not perfectly appropriate for Singing Classes is left out.
Specimen copies mailed for 75 cents.
The usual reduction for quantities.

With the IDEAL, which is a most real book, and the HERALD OF PRAISE, which is the best praise book, teachers and choir leaders will be fully equipped for a successful musical season.

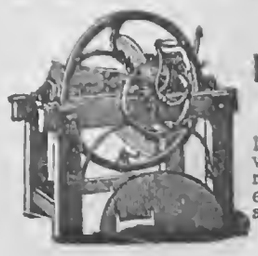
TRADE KIDNEY-WORT MARK
THE ONLY MEDICINE
IN EITHER LIQUID OR DRY FORM
That Acts at the same time on
THE LIVER, THE BOWELS, AND THE KIDNEYS.
WHY ARE WE SICK?
Because we allow these great organs to become clogged or torpid, and poisonous humors are therefore forced into the blood that should be expelled naturally.
TRADE KIDNEY-WORT MARK
WILL SURELY CURE
KIDNEY DISEASES,
LIVER COMPLAINTS,
PILES, CONSTIPATION, URINARY DISEASES, FEMALE WEAKNESSES, AND NERVOUS DISORDERS,
by causing free action of these organs and restoring their power to throw off disease.
Why suffer Bilious pains and aches?
Why tormented with Piles, Constipation?
Why frightened over disordered Kidneys?
Why endure nervous or sick headaches?
Use KIDNEY-WORT and rejoice in health.
It is put up in Dry Vegetable Form, in tin cans one package of which makes six quarts of medicine. Also in Liquid Form, very Concentrated, for those that cannot readily prepare it. Both acts with equal efficiency in either form.
GET IT OF YOUR DRUGGIST. PRICE, $1.00
WELLS, RICHARDSON & Co., Prop'r's,
(Will send the dry post-paid.) BURLINGTON, VT.

TO RENT OR FOR SALE.

My farm of 4,000 acres in Henry Co., Ill., bounded by Green River on south line, One Mile Living Creek on east side, 3½ miles, one east and west grove through middle; large grove in center; divided into many fields, all fenced with cedar posts, 3 boards and 3 wires. Two houses, new brick and old frame; 7 barns, cribs, etc.; 2,000 acres corn, timothy, clover and blue grass; 2,000 acres dry mixed pasture. Capital place for a colony or for dairy or creamery. Prefer to rent. Will take $1 per acre cash and balance of rent in improvement for our mutual benefit. Five years' lease and privilege of five years more at agreed rates. Here is a fortune for some good people that have means and can agree with each other. None others need apply. I have taken as high as $6,000 a year for pasturage from others, besides reserving for my own herds and for tillage. Also for sale, if desired, herds of cattle and horses and hogs; or I will rent the tillable half if preferred. Address
H. H. HAAFF,
Atkinson, Henry Co., Ill.



The Belle City ENSILAGE AND FEED CUTTER.
It has no equal for good, rapid work and durability. Can be run by wind power. It suits every time. Send for circular and name this paper.
DAVID LAWTON. Racine, Wis.

Reading for the Young.

LITTLE CHILDREN.

ROUND the cheerful fireside glowing,
When the wintry winds are blowing,
And the cold and dripping rain
Dashes on the window-pane,
Come the little children creeping
Where we still the logs are heaping,
And enrich the ruddy blaze
With the sunshine of their gaze.

Sweet the echoes now are ringing,
From these little children bringing
All their bright and gladsome mirth
To refresh us worn of earth;
All their pretty ways beguiling
Us from sorrow into smiling,
As awhile we bury strife
In the brightness of their life.

Gaily climbing on our knee,
Laughing, talking merrily,
Purest innocence and grace
Beaming from each roguish face;
Capture they with sunny wile
Many a soul-illumined smile,
As they play their tiny parts,
Climbing right into our hearts!

Where shall man discover treasures,
Where shall he enjoy such pleasures,
As those resting on his arm,
In their pure delightful charm?
Or those playing on his knee,
In their sweet simplicity?
They below for comfort given,
Emblems also are of heaven!

FARMING FOR BOYS AND GIRLS—NO. 32.

HENRY STEWART.

Exhaustion of the Soil.

THE business of farming may very easily be so carried on as to soon reduce the soil and its owner to poverty. If a farmer were to keep on year after year in growing wheat, corn, potatoes and hay, and selling these, and putting the money in his pocket he would soon be able to tell precisely the value of the fertility of the soil, for by and by he would not be able to produce anything because the soil would be exhausted. This is a very unwise course to pursue and yet many farmers have done this and are now working hard to bring back to their farms some of the fertility which they once possessed, but which they have taken out of them and sold.

Let us suppose a case. A man owns some cows and feeds them well so that they yield rich milk which he sells for money. With a part of this money he buys food for the cows; with another part he supports and clothes himself and the rest he puts into the bank for use when he is old and unable to work. Another man has the same number of cows, but he kills one of them every month and eats some of the meat and sells the rest of it and spends the money for clothes and other necessaries. Now which of these two men is the wise man and which is the foolish one? And if we put a farm in place of the cows, we may find thousands of farmers who have done just as we have supposed the foolish man had done with his cows. It is true that he has not precisely killed and eaten his land, but he has done what comes to the same thing he has made it useless and unproductive and has consumed the proceeds of his waste.

But the soil cannot be wholly exhausted. Before that can happen the whole of it must be carried away, which is clearly impossible. We may grow crops upon a field for a hundred, nay, a thousand years, and we shall be unable to perceive that any part of the soil has been taken away and yet every year with each crop a part of it has been dissolved and removed. So that while the soil itself remains it will still contain some of the potash, lime, phosphoric acid, soda, magnesia, etc., of which it is made up, but these will not be in such a state that they can be dissolved in water and taken up by the roots of the growing crops except in very small quantities, and these small quantities will be unable to produce such a crop as will pay the farmer for his trouble and labor. This is what we mean by exhaustion of the soil.

Some soils are really inexhaustible. Some rich clay soils may continue to grow crops for hundreds of years and some do so continue; but some poor sandy or gravelly soils are worn out so much in 20 years that they cannot be made to grow wheat or corn with profit, unless they are manured liberally. But the poorest soils will recover from their exhaustion in course of time, because there is a gradual wearing down of the small particles by the rain, and the effects of the air upon them, and the large pieces are broken up by frost and these smaller fragments in their turn become smaller every year and gradually wear down into so fine a condition that they become soluble in water. So that we see the soil cannot really become exhausted completely, for it will be able to produce something, however little that may be. This little is then the natural fertility of the soil which is produced year by year by the action of heat, moisture and air and would always remain the same if the seasons were all alike. But as there are some seasons more or less favorable than others, so this natural fertility of the soil is greater in some years and less in others. The business of the farmer is to treat this soil so that its natural fertility, however much it may have been exhausted, may be restored and increased; and this he does by cultivation.

There is an old story to the effect that an aged man about to die called his sons to him and told them that a quantity of gold was buried somewhere upon the farm, but he would not say where it was hidden; it was their business to dig for it. After the old man had died the sons dug up every foot of the land in search for the hidden gold but found none. They then sowed the land to crops, which after the thorough digging yielded very bountifully, and the young men then discovered that this was the gold which their father declared lay hidden in the soil. This old story has a useful moral. Whether it actually happened or not, we know the lesson it gives is true and that the cultivation of the soil recovers it from its exhaustion, and that by good farming we help this recovery as fast as we exhaust it by taking off crops. For, in fact, all farming is an alternate process of exhaustion and recovery. The course of safety, however, lies in helping the soil to recover before it is too much exhausted and while recovery is easy.

DAIRYING FIFTY YEARS AGO.

BY MRS. E. J. R.

THE milk teams were rolling swiftly over the country roads; some with one can, and others with the milk from many dairies. The creamery and cheese factory, which was the grand objective point of all these people, was just beyond. There the milk of nearly six hundred cows was manufactured into cheese and butter by three people, and the productions were so perfect that all the country round felt a just pride in the "White Clover" creamery.

"Not much like the way we used to work fifty years ago," said Aunt Esther, looking from the window upon the children and old men, who, as it was a busy season, drove the milk teams, thus leaving the strong hands in the harvest fields.

"Did you make butter fifty years ago, Aunt Esther? Please tell us all about it," said one and another of the group gathered around her.

Aunt Esther was a general favorite, a matron of nearly four score years, whose visits to her children and grandchildren were always most welcome, and now the prospect of a story from the trim old lady, who always did all she did so neatly and well, was welcome.

"I suppose you think Aunt Esther couldn't make gilt-edged butter, eh?" she said, smoothing her cap strings, "but I tell you, children, we had nice butter in those days if the cream was raised in wooden tubs and churned by hand."

"Tell us all about it," said a chorus of voices.

"Well, we had a dairy of about fifty cows, and it was some work to take care of it. We had small tubs to set the milk in, and these must be scoured every day, for everything must be kept sweet and clean for butter making. We had a cool cellar to raise the cream in, and churned it as soon as it was sour enough, but the greatest trouble I had was in worrysome neighbors. I washed my butter you see, which very few people did in those days, though every one does now.

"You'll be sure to spoil the butter, you'll wash all the sweetness out," said one and another who came in to give advice.

I paid no attention to them but went quietly on washing my butter. A man came up from Orange County and bought the whole of it in the late Fall at a tip-top price."

"Did you pack your butter in pails as people do now, Aunt Esther?" said one.

"No, we packed it in half barrels, and kept brine over it, and it kept nice and sweet, but deary me, children, there was a sight of hard work and worry about dairying in those days, and we couldn't get our money but once in the year. Often we had to wait till Spring for the whole of it."

"Dear me," said Mrs. Buskett. "How very tiresome it must have been, and then you must have felt anxious all the time. Now, three persons do the work of thirty or forty, and we know the goods will sell, so I don't believe the good old times were any better than these."

"No, children; a good thing is a good thing, let it be made when it will, and I ain't such an old fogy that I can't see that the world is growing wiser as it is growing older. Yet after all, I will stick to it that I made just as sweet, nice butter fifty years ago as is now made in your Creamery."

LETTERS FROM THE COUSINS.

UNCLE MARK.—I wrote a letter a long time ago to Uncle True, which he printed and now I have something to tell you, Uncle Mark, so will write again. Accompanying this letter is a box containing five wheat heads. I asked my uncle if he was intending to send some, but he said he thought he would not. I send these not thinking to gain a prize, but that the RURAL may see some of the Wick's Wheat of which we are very proud, as my uncle is the originator of it. This is not a fair sample really for wheat in this section is a very poor crop this season, and the heads are a trifle green, as I gathered them just before writing. The millers all agree in saying that it makes a better quality of flour than any other variety and will pay more for it for that purpose. The yield may not be greater but for flour it is unsurpassed and is in great demand about here for home use.

I said I had something to tell you. We received our RURAL seeds and the potato. The pinks I sowed in my cold-frame and it seemed to me that every seed grew. When it came time for transplanting I had a large bed of pinks. A lady visiting us one day went to see our flowers and wondered why we were raising celery with them. I, being rather indignant at that, informed her that what she called celery was a very choice variety of pinks, which we had received from the RURAL NEW-YORKER. She told me to taste, which I did. Surely it tasted like celery, but I would not be convinced until I called on a friend who had received seeds also, and found her pinks doing nicely. One glance at them satisfied me that mine were really celery. It would have done you good to hear that lady laugh. But now I have set my celery in trenches and perhaps next Winter, when we are enjoying it, we shall not very much regret the mistake "some one" made. You know the old saying, "there is no great loss without some small gain," though in this case I do not think the gain small, for we have a quantity of celery and also the pinks. Now, Uncle Mark, do not infer from this that I never saw any pinks, but I had so much confidence in the RURAL that I could scarcely believe my own eyes. The other seeds are doing nicely. Yours, ALTIE W. J.

King's Ferry, N. Y.

[Quite a *sell*ery affair, was it not? However, I think the mystery can be explained. Perhaps "Altie W. J." will remember that in connection with other seeds we sent a package of celery seed to each of the cousins, and it is probable that one found its way to her home by this means or it may have been an "extra" in the regular distribution.—U. M.]

DEAR UNCLE MARK.—As I have not acknowledged the receipt of the seeds you so kindly sent me I will do so now with many thanks. The seeds you sent mother all grew and look promising but I am afraid the chintz bugs will get the best of the Washington oats and the Branching Sorgum as soon as the wheat and rye are cut they travel to the cane, corn and to whatever they can find. They have been here eight years. I think we will have to starve them out by raising hay, corn and stock. I would like to tell the cousins what use I made of my first dollar. Well I bought a heifer calf which is now seven years old. She has had four calves, one of which died. We realized 54 dollars besides having a $10 steer left. The dollar that I paid for my calf was gathered in a little savings bank in small bits from a penny to a dime. I am afraid I will worry Uncle Mark's patience so I will close by asking for an agent's outfit I think we can get several subscribers for the RURAL NEW YORKER. Most every one thinks the seeds worth the price of the paper. BERTIE SHINE.

Wankon, Iowa.

DEAR UNCLE MARK.—As it has been a long time since I wrote to you, I thought I would write today. Sister and I are now going to school, and have a long and dusty road to travel. We hav'nt had any rain since the 30th of June. We have to learn pieces, but I don't like to deliver them; but mamma says if I don't learn at school I will never make a public speaker. I told her I believed the garden business was the best any way, and I would only have to learn to talk to my customers. We have the most of our vegetables on bottom land, consequently we are not suffering as much as our neighbors. The mercury stood one day at 110 deg in the shade; it is now cooler, with some appearances of rain. I wish you could see our Caladium bed it is said to be the finest in this country. I wish I could send you some of my watermelons. WILLIE DECKNER.

Atlanta, Ga.

DEAR UNCLE MARK:—I thought I would write and tell you about mamma's pinks. She sowed part of them and they grew very nicely. She has about thirty different kinds in blossom. We have a good many flowers. I guess I sent my name in too late or did not direct my letter right last Spring, as I did not receive any seeds in the Horticultural distribution to the Cousins. We like the RURAL very much. Your nephew,

Lime Hill, Pa. CLARK BRAMHALL.

[The seeds were sent all right to your present address. Am sorry you failed to receive them. U. M.]

DEAR UNCLE MARK:—I am ten years old. My grandpa takes the RURAL and I like to read the cousins letters very much. The seeds that my grandpa received did well, all but the oats, the rust spoiled them. He has 63 pinks and they are all in blossom. He cut the White Elephant potatoes into thirteen pieces, and I will tell you in my next letter how they yield. I go to school and have to walk a mile but I have a little time nights and mornings to attend to flowers in my garden.

Your niece, PHINEY STRAHL.

Polo, Ill.

DEAR UNCLE MARK; I have never written to you before, but I have been reading the Cousins' letters and thought I would like to join your club. My father's farm is two miles from the little village of Hales Eddy, and on it we keep eight cows, one of which I milk every day. The Elephant potato is growing nicely; my sister Helen keeps the bugs off of it, and she gets two cents a day for doing it. K. E. C.

Hales Eddy, N. Y.

AN INDIAN BOY'S LETTER.

BELOW is given a letter written by a Sioux lad, of fifteen years, in which he compares country and city life. Perhaps the Cousins will be interested in his queer manner of expression. It is written to his grandfather.

"Sometimes when one day very warm I am very tired I do not like to a farmer. When I am tired that is not right. Sometime when I want working I take the basket and the ladder and I climb up the trees I pick up the apples. When the basket is full I am walking I take home and again take the other basket again I go round walk and which one tree is good apples again I climb up the tree and now I came back to the new York O very beautiful big city great many people lives in the new York I see great many kind, big sea and I see great many steamboats they in the new York and again this Summer two boys going to the Philadelphia. * * * I think they like to the farmering very good that is best way the work and learning in the School room too. and you try never do not like the tired you try very hard in the farmering never tired when you work do not tired because the farmer is very best way because the farmer is earning money."

(Rural New-Yorker.)

The best people will vote for the best man every time. And we judge by the number of the St. Jacobs Oil constituency, that it is the best remedy for the rheumatism known. Prof. Tice, of St. Louis, among others, says so.—*Adv.*

Sabbath Reading.

I WONDER WHY.

WHY doth my life from year to year
A useless, aimless thing appear?
Why do my daily actions prove
The less of faith, the lack of love?
And still for graces of the mind
The more I seek the less I find,
And often to myself I sigh—
I wonder why, I wonder why.

The friends I love, the true and brave,
Are called to share an early grave,
And those the dearest to my heart
Who live, will soon alas! depart.
Why am I spared amid the strife?
What is the object of my life?
Why live I on while others die?
I cannot tell. I wonder why.

And yet there must some reason be
Why life was granted unto me,
When I my duty can fulfill
With ready hand and yielding will;
When I the daily cross can bear,
And learn the easy yoke to wear;
When I can thus myself deny
I shall not need to wonder why.

When I can feel from sin set free,
When God's own spirit dwells in me,
When I can feel a Saviour's grace
Hath found within my heart a place,
When love doth in perfection bloom,
And hope can rise beyond the tomb,
And faith can lift unwavering eye—
I shall not need to wonder why.

THE BIBLE THE BASIS.

THE Bible is the basis of the truest and best civilization. One of the reasons why is because it includes all ranks and conditions of society, from the highest down to the lowest of the low. No wonder the Lord Jesus should send back to John the Baptist in prison the following message as the climax of his answer to all his queries: "And the poor are having the gospel preached unto them." Every non-Christian civilization has simply gilded the upper crust, but carried heathenism and barbarism in its heart. The old philosopher of Greece and Rome fawned around the rich and powerful, but despised the poor; and would have felt insulted at any suggestions to use their wisdom and talents to teach and instruct them. But Christ came to "seek and to save that which was lost." It is impossible to present to the world the spectacle of a redeemed, restored, and refined humanity without due attention to its less favored and less hopeful class—the "pieces that are lost." This is just what Christianity is doing. It lays the right foundation for a stately and permanent edifice. It aims at cultivating the whole field without leaving any dangerous jungle in which beasts of prey may lodge, and from which they may sally forth to prowl and destroy.—Christian Statesman.

"FORGIVE US OUR TRESPASSES."

A STORY is told of a certain nobleman of Alexandria who complained bitterly to the bishop of that city of his enemies. While in the midst of his tale the bell sounded for prayers, and bishop and nobleman dropped on their knees—the former leading in the Lord's prayer, and the latter leaving for the time his story untold. When the bishop came to the petition, "Forgive us our trespasses," he stopped suddenly, leaving the other to go on alone. The nobleman attempted to continue, but, startled by the sound of his own unaccompanied voice, and recalled by his companion's silence to the significance of the petition, stammered, ceased praying, and rose from his knees, a hopeless man, until he afterwards found hope in a better disposition toward his neighbor. It is an easy thing to say; it is difficult, sometimes, to say it understandingly. If we stop at this petition when we are repeating the Lord's prayer until we have taken in the idea of it, how many of us will go on?—Watchman.

TRAVELING BY COMPASS.—A story is told of an old hunter in Michigan, who, when the country was new, got lost in the woods several times. He was told to buy a pocket-compass, which he did, and a friend explained to him its use. He soon got lost, and lay out as usual. When found he was asked why he did not travel by the compass. He said he did not dare to. He wished to go north, and he tried hard to make the thing point north; but 'twasn't any use. "'Twould shake, shake, right round the point south-east every time."

A great many people fail of the right directions in life for the same reason of the mishap which befell our Wolverine friend—they are afraid to take the Bible and follow just as it points.—*Sunday Magazine.*

WHENEVER the soul comes into a living contact with the fact and truth, whenever it realizes these with more than common vividness, there arises a thrill of joy, a glow of emotion. And the expression of that thrill, that glow is poetry. The nobler the objects, the nobler will be the poetry they awaken when they fall on the hearts of a true poet. —*Prin. Schairp.*

RECLINING upon soft cushioned seats in the house of God, and listening, it may be, to eloquent sermons, is not the highest Christian service. Christ's life was a busy one, and is our example, to be followed as closely as possible.

IT is one great fact that Christ came into the world to save sinners. Another important fact is that we are all sinners and in need of this salvation.

Ice water is rendered harmless and more refreshing with Hop Bitters in each draught.—*Adv.*

PERSONAL ITEMS.

Ralph Waldo Emerson expects to remain at Concord for the remainder of his days. He is too feeble to travel.

General Robert Lowery, the Democratic candidate for Governor of Mississippi, is fifty-five years of age, a lawyer and an ex-Confederate brigadier.

Ex-Governor Washburn has a mill at St. Paul that grinds three thousand barrels of flour a day. The Pillsbury mill grinds five thousand barrels.

Mrs Edson, the President's patient nurse, shows the signs of her long term of watching in the fact that she has lost ten pounds of flesh since the shooting.

Oscar Wilde has expressed his intention of joining a ladies' flower-growing company which is talked of in London, and of growing for it acres of daffodils.

Ex Senator Conkling denies, over his own signature, that he ever uttered the famous saying: "The President has forced me to commit suicide or murder. I prefer murder."

General D. H. Hill, who was one of Lee's division commanders, is now president of the Arkansas University. The school has 440 students and General Hill makes a popular executive.

Thomas A. Edison has found it necessary to establish a training school in New York for his men, in which they can be educated in the elementary principles of wiring buildings for the electric light.

Sitting Bull says that Spotted Tail's death was a fit ending for a fool. S. B. adds that S. T. surrendered when he should have stuck to the warpath. Sitting Bull is the Carlyle of the plains, the scolding philosopher of the Aborigines.

While Generals Grant, Sherman, Sheridan and Rosecrans will attend the reunion of the Army of the Cumberland at Chattanooga next month, the society will also number among its guests Generals Johnston, Gordon, Wheeler, Colquit and Wade.

George W. Cable, the novelist, has bright eyes and a slender form. These are the only characteristic things about his appearance. As neat in his dress as in his work, and unshaven, he is not one who would attract attention. His voice is clear, but not strong, and he does his smiling with his eyes. As gentle in his manners as a woman, he has a quiet humor that fringes all his conversation and occasionally asserts itself strongly enough to become sarcasm.

[Reading, (Pa.) Times and Dispatch.]

Art and Oil.

The Norfolk Virginian of January 16, 1881, refers to the remarkable cure effected by St. Jacobs Oil in the case of Prof Cromwell—known the county over for his magnificent Art Illustrations—who had suffered excruciating torments from rheumatism until he tried the Oil, whose effects he says were magical.—*Adv.*

A $40 Twenty-Six Shot Sporting Rifle for $15

AN EXTRAORDINARY BARGAIN.

THE EVANS TWENTY-SIX SHOT MAGAZINE SPORTING RIFLE.

SHOOTS 26 SHOTS IN 60 SECONDS WITHOUT REMOVING FROM THE SHOULDER.

No hammer in the way. Throwing down the guard EJECTS LOADS and COCKS. THE EVANS is without exception the most accurate, longest ranged, easiest loaded, quickest fired, best constructed, simplest and most perfect breech-loading Rifle in the World. The new model and latest Improved EVANS MAGAZINE SPORTING RIFLE is exactly as represented in above cut. It is 44 Calibre, centre fire, 28 & 30 inch barrel, engraved black walnut stock, and sighted with graduated sights up to 1200 yards, at which distance it is more accurate than any Rifle in the world. The magazine which is located in the stock as shown in Cut Number 2, Contains 26 shots, or more than double the number of any other Repeating Rifle in the world. The working parts are ALL STEEL of the finest quality, case hardened and blued and the New Patent Locking Device makes it POSITIVELY SAFE TO CARRY when loaded. THE EVANS is a great favorite with Sportsmen on account of the rapidity with which it can be fired, as well as for its accuracy at any distance from 100 TO 1200 yards. Owing to the failure of the Evans Rifle Co. we were enabled to purchase their entire stock of $30,000 worth of perfect Rifles for less than one-third the cost of manufacture, and as these beautiful and expensive Rifles cannot be made cheap enough to compete with cheaper Rifles they will not be made again. This will be your last chance to secure one at the low Price of $15 and we pledge our business reputation that they cost to manufacture double what we ask for them.

UNTILL FURTHER NOTICE we will send one new model Rifle as above described carefully boxed for only $15 and when cash accompanies the order, will send a box of reloadable Metalic Cartridges and samples of the new phœnix 3 ball cartridge, a great invention in ammunition with which three balls can be shot inside a 12-inch ring at 200 yards. SEND MONEY by P. O. order or Registered Letter at our risk, or we will send the Rifle C. O. D. (collect on delivery) with privilege of examination before paying, upon receipt of $2.00; or your express agent's written guarantee that the Rifle will be returned free if you do not take it, but we do not send the Cartridges if sent C. O. D., as this is an extra inducement to those who send Cash With Order. WHAT IS SAID OF THE EVANS! UNSOLICITED TESTIMONIALS! "The Evans has been my constant companion for two years. I have shot 60 Buffaloes at one run, and pennies from between my wife's fingers, at 40 paces."—Kit Karson, Jr. "The Evans is simply immense. I am proud of it."—Joseph Arnold, Vice-president First Nat. Bank, Lockport, N.Y. "I have used the Evans in competition with the Sharp, Winchester, and Ballard, it beats them all."—J. Frank Locke, Barnamsville, Minn. "It shoots like a house a fire! I can clean out a whole band of Indians alone with it. I shall recommend them wherever I go."—Texas Jack. "It is the Strongest Shooting Gun I ever put to my shoulder, and as for accuracy it can't be beat. I know it to be the best Rifle in the market."—J. Boyd, of Yates' Sharp Shooters. We guarantee every Rifle Perfect in every Respect.

THE EVANS SADDLE RIFLE, similar to the above, except a trifle lighter and 22 inch barrel, price $14, including swivels and straps. THE EVANS can be used as a single shot breech-loader and the magazine held in reserve if desired. Price of reloading tools for reloading shells, $4.00, former price $6.00. Evans cartridges can be reloaded many times. ORDER NOW, even if you have no use for a Rifle for some time to come. You will never get another such bargain and you can readily sell it for $30 to 40, and we hereby agree if the rifle is not exactly as represented to refund the money in every instance and pay you $5.00 for your trouble. SPECIAL OFFER.—Any one getting up a Club and sending us $90 will receive seven rifles. We refer to any Bank, Mercantile Agency, Express Company, or Newspaper Publisher in this City. ADDRESS E. C. RIDEOUT & CO., 10 Barclay St. N.Y.

Herdsman.

OUR ANIMAL PORTRAITS.

Jersey Bull, Prospect.

THE premium Jersey Bull, Prospect, (2047) was dropped November 7, 1874; color, solid orange-fawn with black points; sire, imported Baltimore Boy (837); dam imported Venus of Oakland (2838). After having taken more first and herd premiums than any bull in Maryland, Prospect is now at the head of the large Jersey herd of the Messrs. Rowe's Co-operative Stock Farm, Fredericksburg, Va. He is six years old, weighs 1,250 pounds, is uncommonly hardy and easy to keep and has no bad habits. Premiums have been awarded to him as follows:—At the Maryland State Fair, held at Westminster, October 1877, he won first premium as the best Jersey bull between two and three years old, and he was also at the head of the herd that carried off the herd premium. At the Maryland State Fair held at Pimlico, September 1878, he again took first premium and once more the herd premium was won by the herd that had him at its head. At the Baltimore County Fair, in September 1880, the herd premium was again awarded to the herd at whose head he was. These were the only occasions on which he was exhibited in Maryland, and every time he bore away the highest honors. At the Virginia State Fair, held in Richmond, in October 1880, no premium was offered for the best herd of Jerseys, but he took all the honors offered to the best of his class by winning the first premium for Jersey bulls over three years old.

Farm Topics.

NOTES FROM THE RURAL FARM.

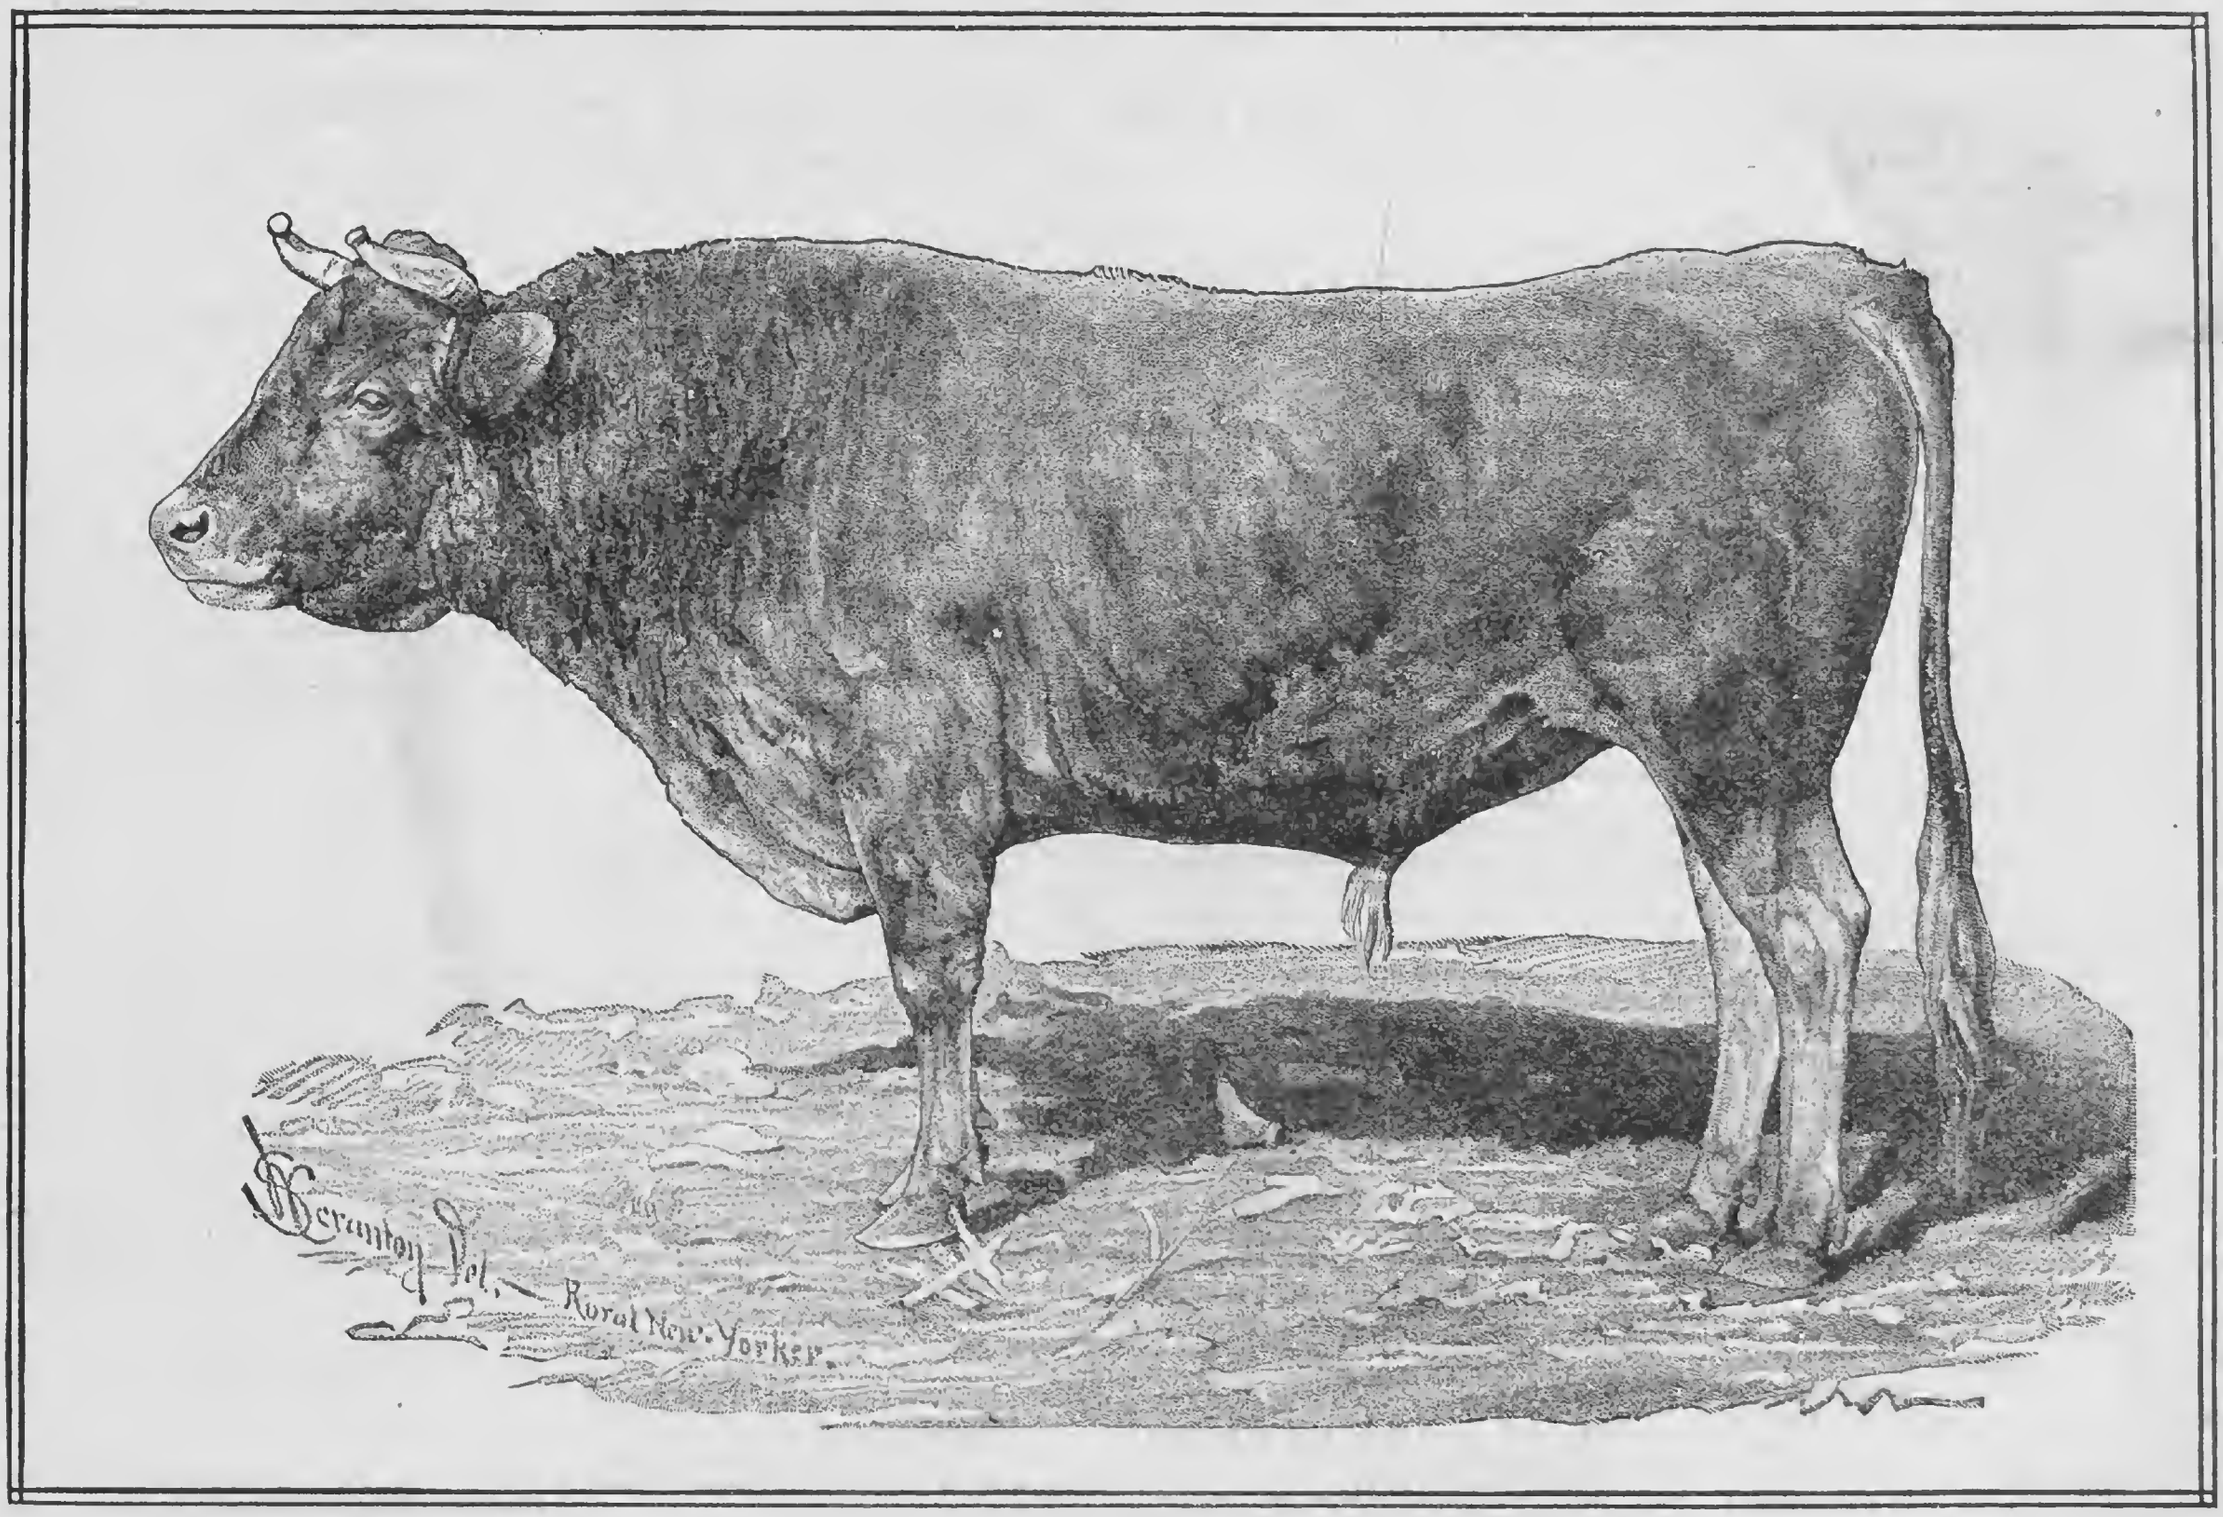
Fertilization of Corn.

AN illustration was given in the RURAL of Jan. 1st (1881), of the tassel of what is variously called the Wild Corn of America, Rocky Mountain Corn, Cow Corn, Corn in Pods, etc. This is by many looked upon as the wild corn from which our cultivated varieties have sprung. August 10, our plants were in bloom, the silk being receptive at the same time that the pollen was ripe. This is not the case with a majority of the stalks of our field corn of the present day, as the tassel generally sheds its pollen before (proterandrous) the silk appears, or, less commonly, *after* it appears (proterogynous). We have found that in the earlier stalks of field corn the tassels and silk often mature at the same time; while later the tassels are generally ripe first. In the different kinds of sweet corn, however, both silk and pollen are, as a rule, mature at the same time. Supposing that all kinds of corn now cultivated had their origin in the "Podded" or "Wild Corn of America," it would appear that sweet corn has changed less respecting the relative maturity of the stigmas and anthers than field corn. It would prove a very interesting experiment to ascertain which seed would prove the more productive, viz., that fertilized by the pollen of its own or another stalk.

Bermuda Grass at the Rural Farm.

Many of our Northern readers have heard of Bermuda Grass, no doubt. It is severally estimated in the South as a curse and a blessing—as a curse where it gets possession of tillable land; as a blessing when it covers lands where scarcely any other herbage will grow. In many parts of Texas, Louisiana and other Southern States it is chiefly depended on for pasture for immense herds of cattle. It delights in a sandy soil, and has been planted as far north as Tennessee, North Carolina and Virginia upon sandy hills. It is in the extreme South the only yard grass, and it makes a sod so tough that it is almost impossible to force a plow through it.

Early in the Summer we received a sod of this Bermuda Grass (Cynodon dactylon), about a foot in length by three inches in width, from Tennessee. It remained in the office until thoroughly dry and apparently dead. It was then taken to this farm and planted in a very dry muck-and-sand soil. In a few days it showed signs of life, and in a few weeks was a mass of green of a bright sea-green color. It soon began to send out its short-jointed, wiry shoots in all directions, which we observed grew, on an average, an inch and a half in twenty-four hours, rooting at each joint as they proceeded along the surface of the ground, easily making their way under stones, pieces of wood and the like, which had been placed to ascertain in how far these would obstruct or in what way change the growth. Thus, from so small a sod a little plot seven feet in diameter had formed by August 25. We receive many questions regarding Bermuda Grass every year, as to its hardiness, where seeds may be obtained, etc. We do not know that it has been ascertained how far north it is hardy, and this is one of our objects in planting it here. We shall protect a part with salt hay, and leave the rest exposed. It has bloomed freely during the entire Summer, and though all other grass was dry and parched, this retained its fresh, pale-green color throughout the drought which was exceptionally long and severe. Its flowers are borne in spikes of from three to five, two inches in length, similar to those of the common Crab Grass—Panicum sanguinale. But it rarely seeds in this country. It is propagated by dropping;



JERSEY BULL, "PROSPECT."--From a Photograph.--Fig. 425.

The Rural New-Yorker is now conceded to be the leading agricultural and horticultural journal of this country. Its Experiment Farm and Grounds of 82 acres are worked in the interests of subscribers, and its Free Plant and Seed Distributions have introduced many of the best farm and garden plants in cultivation. The price is two dollars per year—really a Four-Dollar Paper for half price.

cuttings two inches—more or less—in length in furrows several feet apart. We find that cattle and horses display peculiar fondness for this grass. Mr. Killebrew, in his excellent work "The Grasses of Tennessee," states that "it is used to bind the levees on the banks of the Mississippi and of railroads." Again he says "no other grass will yield such an amount of valuable hay; surpass it in nutritive qualities; support on an acre of pasture such an amount of stock, or so effectively stop and fill up a wash or gully." "But, on the other hand, its *extirpation*, when once well established, is almost impossible." We shall present engravings of this grass in due time, showing its manner of growth, its rigid shoots, and its fine leaves.

Oats.

Of the ten different kinds of oats tried at the Rural Farm the past season Pringle's cross between the Excelsior and Chinese Hulless were the first to ripen. They were headed out June 24, and cut July 15. These oats do not yield very heavily with us, and we fail to see wherein they differ materially from the Chinese Hulless. One pound of seed was drilled on one-fortieth of an acre. The yield was twenty-four quarts of hulless oats, or at the rate of thirty bushels per acre.

The Russian White Oats, so extensively advertised during the early part of the year, were the latest of all and not ready to harvest until July 29. This sort resembles the Black Tartarian Oat, being of a dark color and producing one-sided panicles. From the beginning these oats were behind the Washington growing on one side and a kind of English oat on the other. But while at harvest they yielded, we think, rather less than the others, it may be said in their praise that though the straw is not so thick as that of the other kinds mentioned, they stood up, until they were cut, the best of any. The straw grew to the hight of four feet, the panicles averaging about sixty spikelets. The crop has not yet been measured.

The Washington Oats seem to be merely a selection of the English White Oat. The straw is heavier and taller by half a foot than that of the Russian White, and the field was cut July 20. The panicles averaged seventy-five spikelets.

We received from the Department of Agriculture a package of White Australian Oats—sixteen quarts, which weighed 52 pounds to the bushel, by far the heaviest oats we had ever seen. These were drilled in on a measured plot, one half of which was manured with chemical fertilizer, the other half not at all. On the first the oats grew to the hight of six feet; on the second, about five feet. The straw was very heavy; the panicles when fully headed out were a beautiful sight. All lodged as soon as the oats began to fill, and at harvest were one entangled mass of straw and half-ripened grain.

Mold's Ennobled Oats yielded the heaviest of any in measure though in weight they are light, weighing but 28 pounds per bushel. They ripen with the Russian White. These grew to the hight of five feet and six inches, and yet did not fall, though growing beside the White Australian. The straw is remarkably large and strong, the one-sided panicles often bearing 125 spikelets. Upon one-fortieth of an acre, fertilized with seven and a-half pounds of concentrated fertilizer, the yield was, plump measure, two and a-half bushels, or over one hundred bushels to the acre—the heaviest yield of oats we have ever obtained on this farm. Upon one-twentieth of an acre, *not* manured, the yield was but two and a-half bushels, or *half* as much as on the manured plot.

Upon other measured plots several kinds of oats were sown without manure, which were sent to us for trial by RURAL subscribers. Notable among them were Mammoth Russian Rust-proof and Red Rust-proof, which seem to be nearly alike. The oats are very large, though the panicles bear fewer spikelets than the others mentioned. As there was no rust upon any of our oats the past season, we had no opportunity to try their rust-proof powers.

The Mammoth Russian yielded upon one-fortieth of an acre one bushel and a half—twenty-eight pounds to the bushel. The Red Rust-proof yielded twenty-eight quarts. Of the former two pounds of seed were drilled in; of the latter, one-half pound only.

Bearded and Beardless Wheats.

We believe it is a disputed question whether beardless kinds of wheat do not, or may not, occasionally bear beards, and whether bearded kinds do not sometimes bear beardless heads. It is our impression that well established varieties of wheat rarely, if ever, change in this respect. We should never look for a bearded Clawson or a beardless Black-bearded Centennial. Crosses, however, of recent date may change from the one to the other. We can show bearded and beardless heads from the same seed and every gradation between them.

Our Tests With Green Peas

the present season, as has been stated, show that the English Telephone should take rank among the very choicest peas in cultivation as an intermediate variety. The pods are very large, well filled, and the peas are sweet, tender and delicious, while the vines are abundantly productive. This is said in England to be the same as the Telegraph Pea—still, having tested both kinds, we prefer the Telephone. Day's Early Sunrise is a wrinkled intermediate pea of fair quality. The peas are large, though the pods are only of medium size. We planted one-twentieth of an acre to this pea without manure, and they were given very little cultivation. When the vines were collected, it was difficult to find them, so overgrown with weeds were they. The yield, however, was five pecks of seeds. The vines grow from three to four feet high, and their productive qualities should insure for this pea an extended trial another season.

Progress of Rural Wheats.

In last year's Fair Number of this journal, an account was given of the remarkable change wrought in a Spring wheat four years ago by sowing, in the Fall, seeds so shriveled that it was supposed they would not germinate. In fact, the object of the experiment was to ascertain to what extent wheat might be shriveled and still retain life and germinating power. The result, as then stated, was that, though the land was by no means rich and received no manure, the heads and straw grew to an unusual size, thousands of the former measuring six inches; hundreds, nearly seven. The entire character of the grain seemed to have undergone a change, as it ripened later by ten days than the same wheat from plump seed sown in an adjoining plot, also in the Fall, while the kernels were of a darker color. The longest, heaviest heads were selected for seed and sown last year, and from this crop the head as shown (Fig. 426) is but a fair average of the best. Our engraving in last year's Fair Number was of Defiance, or that which was originally Defiance; the present sketch is of changed Champlain—so changed, indeed, that we are confident that Mr. Pringle himself—the originator—would not recognize it. Both Champlain and Defiance were sown together in the first instance, the seed having been equally shriveled, and both kinds seem to have been changed in the same way. It may be worthy of remark that the kernels of the present crop are heavier—larger than those of last year or the year before. The best heads of each have again been selected for sowing separately, while the main crop will be sown in the usual way so that the effects of selection may be further noted.

FARM NOTES.

WALDO F. BROWN.

WORK FOR A SLACK TIME.—When it gets too dry to plow, as is often the case in early Fall, farmers are sometimes at a loss as to what they had better put the hands and teams to doing. This is the time to attend to little things which are likely to be neglected. In the permanent pasture there are often washes starting, and if in addition there are some loose stones, here are two things that ought to be put together. Make a brush dam occasionally; put a little straw above it—flax straw is the best, and it will pay you to go ten miles for a load of it—and then put your stone on the straw, and you have a barrier that will catch the wash and stop the gully.

SEEDING BARE SPOTS.—Occasionally there is a bare spot in the permanent pasture, or a half-acre patch in the clover field has failed to catch, and how to remedy it is an important question. I have found that to seed with rye and grass seed, about the middle of September, is the best way to manage these spots. If, as is often the case, it is poverty of soil that causes them, I would sow a little bone meal, or scatter some fine manure over them. It will pay to spend ten dollars an acre, or more if necessary, to redeem a barren spot in a permanent pasture; for such places are not only eye-sores, but yield no profit, and the interest on ten dollars is a small amount. In seeding poor spots, always use an extra amount of seed, as it is not as likely to grow as on richer land.

HAVE YOU A GOOD WALK from the house to the barn? Is not this a good time to make one? I think that on a majority of farms, during an open Winter, or a Spring thaw, farmers wade through mud. Try throwing up a walk six or eight feet wide so that the center will be eighteen inches higher than the ditches; then put one thickness of flat stone on the middle of it at least three feet wide, and cover it with fine gravel, and you have a walk that will last as long as you live. If you are near a tannery and can get spent tan-bark, it will pay you to coat the walk with it in the Fall, as it never gets sloppy or tracks into the house in a thaw, and is very easy on sole-leather.

HOW ABOUT STOCK WATER on your farm? Are you short and afraid all the time that if the dry weather continues, you will have to drive the stock a mile or two for drink? If so, now is the time to make a good large cistern or two. You can locate them wherever you want them and fill them with surface water in the Spring, when the water is cold and pure, or even in a wet time in Summer. I have two of these on Highland Farm, and have no trouble in filling them, and have found them a great comfort in times of drought.

PULVERIZE THE WHEAT LAND, whatever you do or fail to do: go on the principle of the woman making gooseberry pie, who sweetened it all she dared—and then shut her eyes and put in a handful more. Work your land till it is fine enough, and then go over it again. If you do not think this will pay, try it on a strip through the field and contrast it with the balance. Lastly—

ATTEND YOUR OWN COUNTY FAIR, and get your neighbors to subscribe for THE RURAL NEW-YORKER—and be happy.

Seven subscriptions at Two Dollars each (our only price) entitle the sender to one copy of the Rural New-Yorker for one year.

Field Crops.

HOPS.

CHARLES A. GREEN.

BILLY BARLOW planted hops. Hops were worth 40 cents per pound, and he figured the income from ten acres, and said to his wife:

"Maria, we've struck a gold mine, and its name is Hops. You can order the piano now, and we will trot the boys off to college."

"But do you know how to grow hops, William?"

"Don't be a fool, Maria; hasn't the old vine in the corner of the garden borne hops since Tom was a baby, with no help but the dead butternut to twine on? Do I know how? Why it is harder to kill a hop vine than a burdock. But just think—*forty cents a pound!*"

Barlow paid a high price for hop roots, for they are always scarce when hops are up. His neighbors sold him hop poles at about their own price; for how could he banter when each individual pole was destined to bear, before the sunshine and the wind, a tasseled banner of hops—otherwise gold. Then he built a big hop kiln, with a gilded fish, six feet long, to keep the ventilator before the wind. Then Barlow sat in the shade and made plans as to what he should do with all the money. Suddenly hops went down, *down*, DOWN. The lower they went the less buyers wanted them, and the more particular they became as to quality—and Barlow's were not above criticism. Then he said to his wife:

"Maria, I am busted on those blamed hops as sure as shooting. If it hadn't been for you and your wanting the piano, and teasing to get the boys off to school, I would have kept out of this miserable pickle."

Barlow's fancy hop house is now a pig-pen and hen-house combined, and Barlow has gone into beans—wiser and sadder but poorer.

Hopkins planted hops. He bought Barlow's hop poles at half price, with all the hop roots he wanted thrown in.

"How is it you plant hops when they are so cheap?" he was asked.

"The price is likely to be better by the time mine are ready for the market," was the reply. "Father and I grew hops years ago Down East; father was never frightened about the price of hops."

Hopkins did not get rich on his first crop—hops recovered slowly, but he kept right on, extending his field, giving the best culture, and producing a first-class article. I pass his place often and my wife and I always notice the beauty of the hops and the careful attention given. The last time we went by, we saw that Hopkins had been painting his house, had put on an addition thereto, with wide cornice and blinds; that he had cut down the windows level with the ground floor, had put in double black-walnut front doors, with copper knobs and bell handle; that he had planted ornamental trees and shrubs on his grounds, and kept the lawn mower whirling. Hopkins drives a nice-looking rig on the street, and is said to carry a savings bank pass-book, into which the hops are entered when converted into hard cash. Hopkins is consulted on important questions of church and State in his community; his boy has married the rich widow's pretty daughter, and all goes as salubriously as strawberries into the small boy's stomach. Whether hops go up, or hops go down, Hopkins plants hops. Barlow knows beans—Hopkins knows hops.

MORAL.—Look before you hop, but, having once considerately hopped, *stay* hopped.

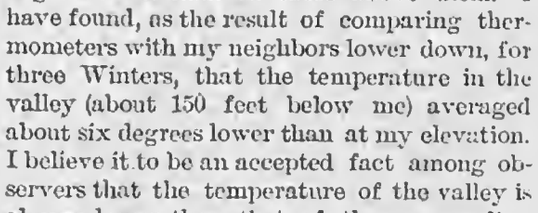
Monroe Co., N. Y.

Salt for Wheat.

THE use of salt to prevent rust cannot be overestimated by the wheat raiser. One bushel to six of salt per acre, sown broad-cast when the wheat is well up and stooling, will almost invariably prevent the ravages of the rust. After the rust has appeared on the leaves, of course, the salt will do no good. Besides being a good preventive of rust, it is a good fertilizer. PROFESSOR A. E. BLOUNT.

State College, Fort Collins, Col.

Horticultural.



MR. PARSONS'S article on the Japanese Maple in a late RURAL is very acceptable and to the point. An article that I had intended to prepare on the subject would have been very much to the same effect. I feel an additional interest in the hardiness of these maples from the fact that a number of friends have planted them on my recommendation. I have therefore made diligent inquiry in regard to their hardiness, besides personal visits, and find the facts to be very much as Mr. Parsons has presented them. In some places they were more or less injured (not killed), and in others not at all; and what is remarkable is, that those forms which were seemingly the most delicate and tender have in reality proved to be the most hardy. There would, therefore, seem to be good reason to hope that these beautiful maples may still prove to be hardy except in Winters of great severity, but probably not on low ground, where the thermometer usually ranges several degrees lower than on those above them. I have found, as the result of comparing thermometers with my neighbors lower down, for three Winters, that the temperature in the valley (about 150 feet below me) averaged about six degrees lower than at my elevation. I believe it to be an accepted fact among observers that the temperature of the valley is always lower than that of the surrounding hills, a fact that is seldom taken into consideration by farmers and gardeners in speaking of the effects of the Winter on vegetation. Anybody who has traveled much at night over the hills, as I have, will remember how cold he has felt on descending into the valleys. These familiar facts, if given their proper place in estimating the hardiness of plants, would no doubt save us many mistakes in planting. I will repeat here what I have more than once said before, that trees and shrubs of doubtful hardiness should be planted in a poor and dry soil, or at least in one that has not been artificially enriched.

HAVE any readers of the RURAL used the Thomas Potato Digger? I saw one at work on the farm of a friend, while riding along the road, and it turned the potatoes out very fast. I had no time to examine it, but asked my friend how he liked it and his reply was, "first-rate." He has since informed me, however, that it bruises the potato badly; and his man, not noticing this, piled them in heaps, and his loss from rot, in consequence, was very considerable. His man, of course, should have thrown the bruised potatoes aside; but it detracts greatly from the value of any digger that it bruises badly a considerable percentage of the crop. It may not, however, have been properly used. How far the fault is inherent in the digger perhaps some of the readers of the RURAL can tell us. It bears some resemblance to a sulky plow, is fitted with a revolver, and is drawn by two horses.

I HAVE often wondered why sea-kale is not more commonly grown. It is surprising, indeed, how few people, aside from professional gardeners, know what the plant is. It is supposed to be difficult to grow, and to involve a good deal of labor; but this really is not so, and even if it were, it is so delicious as to be worth it. Those who have a little glass can easily force it during the Winter.

DR. DUNLEVY makes an earnest appeal to the public authorities and others for the suppression of the ailanthus, on the ground that it is the cause of much sickness among persons of a delicate and nervous constitution. The complaint has often been made by others and is well founded. I have an impression that its planting has been prohibited in Philadelphia. I have known it, when planted near cisterns and wells, to foul the water so as to render it totally unfit for any purpose whatever. Still it is a beautiful tree, possessed of wonderful vitality and will grow generously in sand and on the sea-shore where many other trees will not live at all, and its wood is not without value. It has been suggested that if only the female plant were grown, we should get rid of the sickening odor so generally complained of.

I WOULD state, for the information of Mr.

Parnell, that there is a Gooseberry Society at Paterson, N. J., the members of which grow the English Gooseberry very successfully, as their annual exhibitions abundantly show. I am not familiar with their method of culture, but should be glad to see it described. My own experience with the foreign kinds, like that of most others, has been mildew and failure.

THE strawberries, especially the Sharpless, are giving a woeful account of the drought. By way of experiment I have just been preparing in several ways some young plants with the hope of overcoming the necessity of repeated waterings. It will require several weeks to reach a conclusion. I am satisfied, however, that pot-grown plants have a peculiar value in time of drought, as being better able to sustain themselves than "ground runners." It seems to me unwise to order plants while the drought continues, unless the means for watering are abundant. Anything less than a soaking does but little good under our present scorching sun, which speedily converts the water as it were into steam, and scalds the plants.

IT is quite true, Leon, as every body knows, that the Ox-eye Daisy is a troublesome weed, as are other pretty things. That, however, is quite beside the point I made. Thousands of ladies wore the Ox-eye Daisy last Winter, and seemed to be quite as much pleased with it as with the Paris Daisy. Do you not see the point in that? As to the one being fit to force and the other not, the New York florist seems to have overlooked the fitness of things in this case, and forced the Ox-eye; and, from what I can learn, he will do it still more extensively next Winter. I used to be skeptical; but I have learned that the florist, just so soon as he can see money in a plant, will soon learn how to grow and force it out of season. It may seem stranger still, but I am told that the dandelion will also be forced next Winter, the "prospect," as the florists say, being very good for a demand next Winter, as it was early last Spring. I do not know what next, but am prepared for almost any thing.

HORTICOLA.

TWO NEW BLACK-CAPS.

CHARLES DOWNING.

SKOWHEGAN is a fine, new, early variety which originated in the garden of John A. Carleton, Hillsborough, New Hampshire, and has the reputation of being the hardiest of the Black-caps as well as the earlist to ripen, bearing very abundant crops of large, bright, black berries, without bloom; it also continues longer in bearing than most others. The flesh is moderately firm, juicy, sweet, rich and separates readily from the stem. The canes are strong and vigorous, more or less branching, with many strong, sharp spines.

CENTENNIAL, another quite new variety, was raised by a Mr. Grahill, of Springfield, Missouri, about the time of the Centennial Exhibition, and hence the name. The plant is a strong and vigorous grower, somewhat branching, having a few strong, sharp spines; leaves large, light-green, white beneath, deeply veined. It is very productive of large, jet-black berries, without bloom; flesh moderately firm, juicy, very sweet and rich; it separates freely from the stem and ripens soon after the Skowhegan, being somewhat similar to that variety.

This and the Skowhegan, being hardy and earlier than any of the Black-caps, strong growers, very prolific bearers, of berries of very good quality, are likely, for those who prefer raspberries of this class, to prove valuable additions and acquisitions for home use, and also for a near market, where earliness is an object. These do not sucker but are propagated from the tips. While they are earlier and better for home use and near market, they are not so firm—do not "stand up" so well, in the language of the dealers— as the Gregg and McCormick or Mammoth Cluster, and therefore are not so profitable for a distant general market crop.

THE JERSEY QUEEN STRAWBERRY.

PETER B. MEAD.

IN speaking of strawberries I have heretofore ignored the existence of Mr. Durand's Jersey Queen and Superb, simply because I supposed, for reasons not necessary to name here, that they would never be given to the public. I am very glad to know that I was mistaken, at least in regard to the Queen, now being sent out by Mr. Henderson, and an excellent portrait of which is given on the next page.

The fruit of the Jersey Queen is the nearest approach to the ideal strawberry that I have yet seen. The berry is very large, broadly conical, and the color a fine shade of scarlet. The flesh is firm and melting (like that of the Seckel Pear when ripe), and is full of a rich vinous juice, with a deliciously spicy aroma. It ripens late, is very productive, and a stocky grower. It may be added that the berries run quite uniformly large. I have no hesitation in adding the pomological quality "*best.*" So much I can say of the fruit from personal knowledge. How far the plant will adapt itself to a variety of soils I cannot say personally, but I know enough to warrant me in saying that it promises to do so to a large extent, and I can not help wishing that it may.

Dairy.

PRECAUTIONS AGAINST DROUGHT.

PROFESSOR L. B. ARNOLD.

A PRUDENT business-man eliminates from his business every possible element of uncertainty. He not only secures his capital and investments against loss, but he makes sure that his income shall not fail of being received. Nothing is trusted to chance that can be avoided. He will leave open or unguarded no avenue liable to lead to loss. He would rather pay insurance where there is but one chance in a hundred for him to lose than to take that chance.

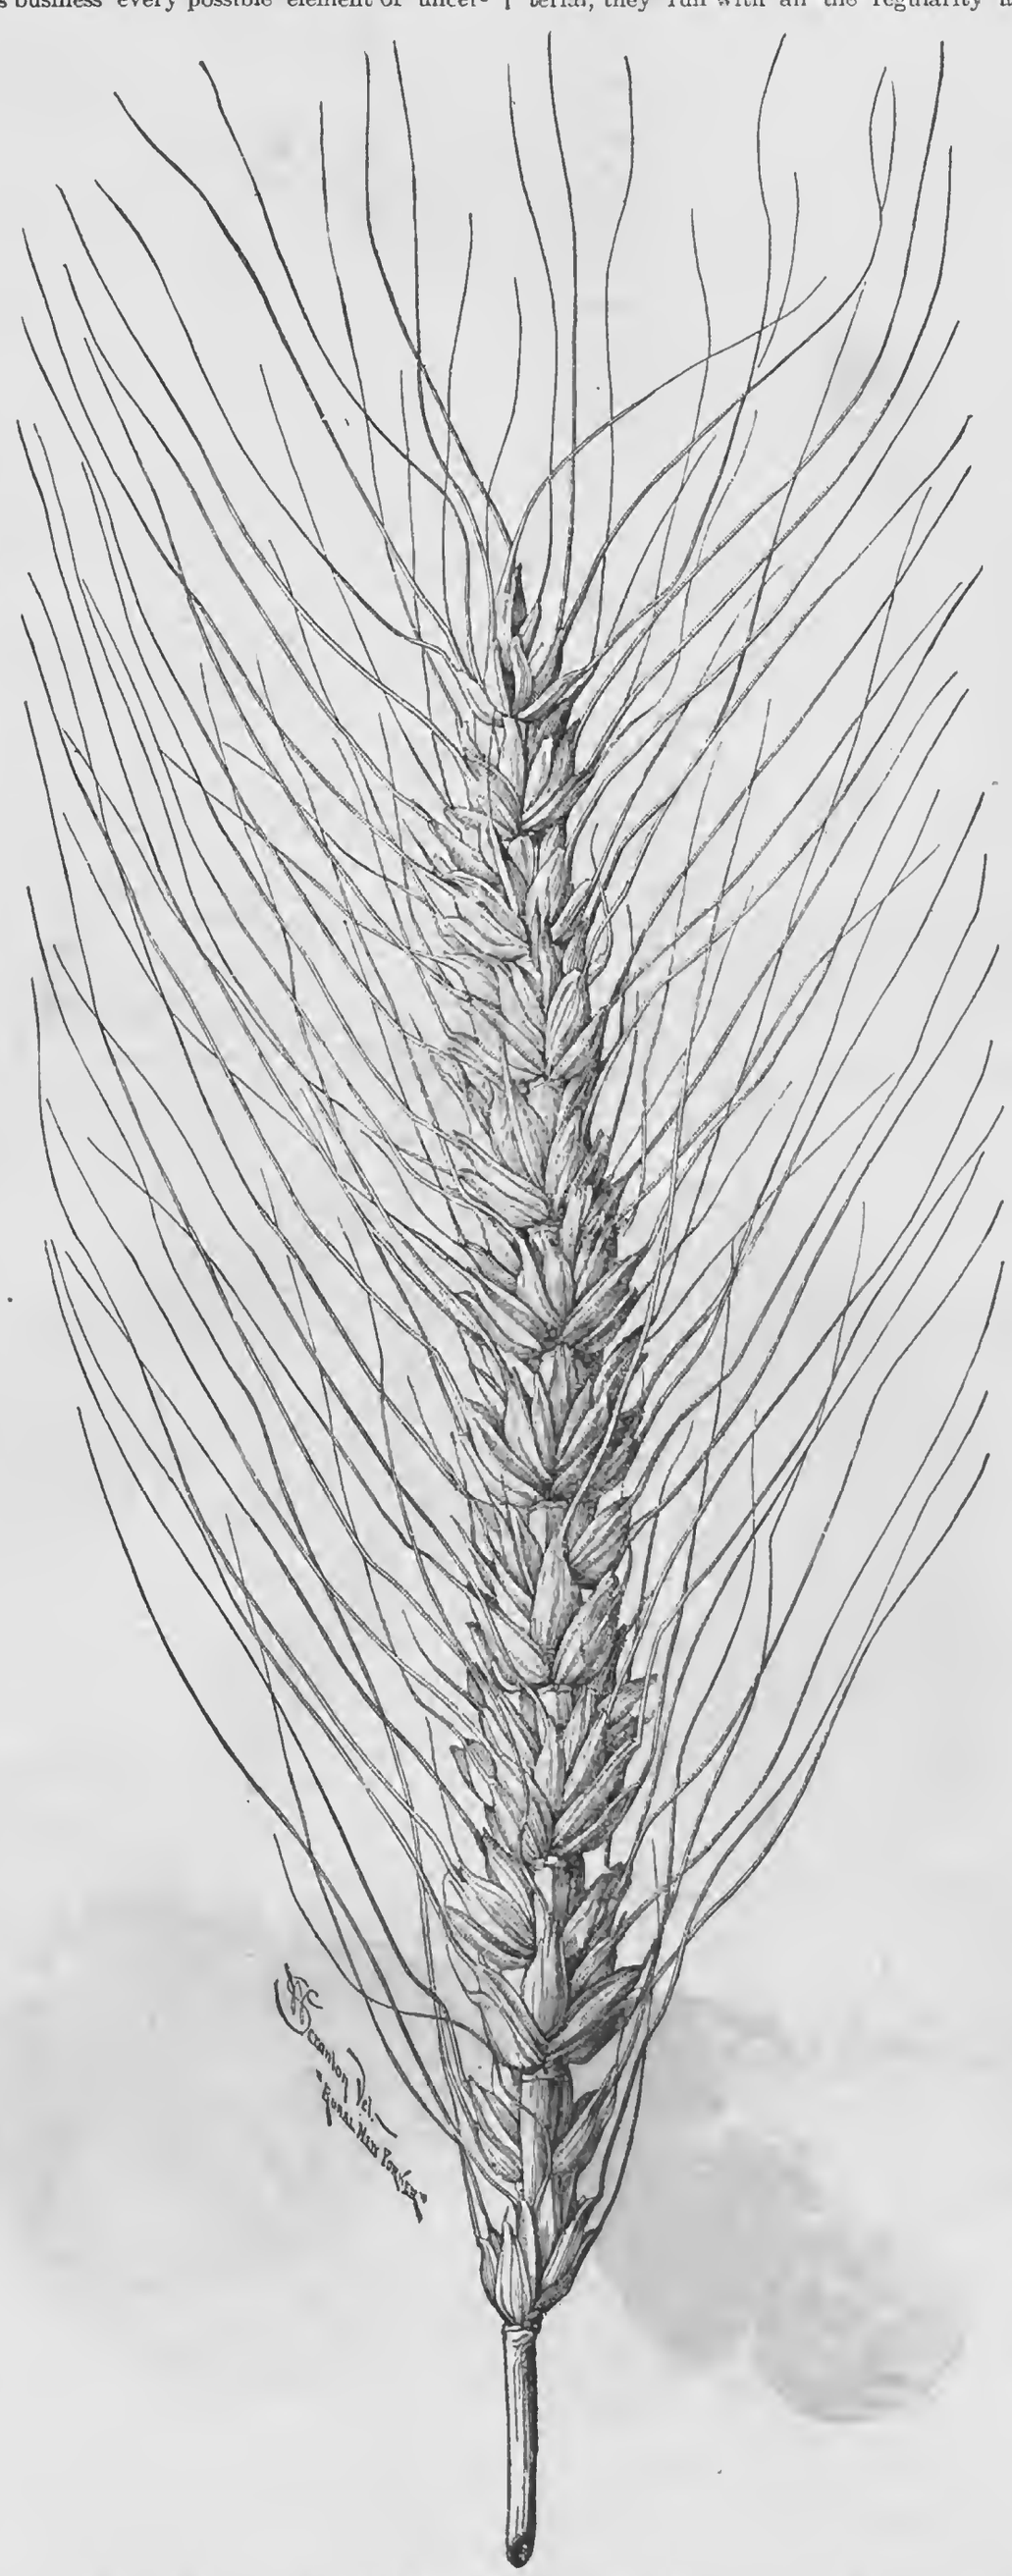
A prudent dairyman should be as cautious. He should insure not only his buildings and other combustible property, but he should effect an insurance on his annual income as well. It happens that unless special precautions are taken, the income of a dairyman is liable to great and frequent fluctuations, but it runs very evenly when properly regulated. A dairyman is said to be a manufacturer, and cattle food his raw material. Milk is his manufactured product, and cows are his machines. They are compound machines, combining both motive power and executive or mechanical apparatus. When properly supplied with material, they run with all the regularity and certainty of any other machines, but, when out of supplies or scantily furnished, both power and product at once diminish.

One of the misfortunes of dairying is that every section is liable every few years to be afflicted with a drought that stops the growth of grass and cuts off the necessary supply, from those especially who depend wholly on grazing; and here is where the security of insurance discloses its importance and merits recognition, but often fails to receive it. Men seem strangely indifferent and dull in appreciating the liabilities of their situation, even after repeated losses have been endured. A man whose house stands but one chance in a thousand of being annually burned will not allow it to go a day without being insured, while the income from his dairy, often worth much more than his house, and which stands about one chance out of five of being cut down every year, will be allowed to run indefinitely without making any effort to secure himself against oft-recurring losses. Where scholars are so inapt and tuition so expensive, experience may well be said to keep a dear school.

The indifference seems all the more strange since it is so easy to insure one's-self against such losses by planting every year a piece of fodder corn, or other green crop, which will be sure to withstand drought and furnish a supply to bridge over a dry time if it comes, but which, if not wanted for such an emergency, will pay more than its cost to lay by for Winter use.

The folly of attempting to go, year after year, risking the profits of a whole year on the uncertainty of the weather, was well illustrated last Winter on the plains in the West. There is a large extent of territory on which cattle can ordinarily squeeze through the Winter without foddering. But every few years an unusually snowy Winter occurs and snow covers the ground so long that stock perish if not provided for. Last Winter was one of this kind, and it swept off hundreds of thousands of cattle by starvation, and millions of dollars were lost which might have been saved by a little precaution in collecting fodder, which would have made grazing a sure and lucrative business. It is the boast of civilization and intelligence that they can control the very elements and mold them to their use; but this risking everything on a turn in the weather, whether on the plains or on a dairy farm, is in the end a costly way of farming, and seems a sort of reversion from the prudence and forecast of civilization back to the uncertainties incident to savage and barbaric life.

These remarks have been suggested by frequent notices in the papers of localities in which the crop of butter or cheese is now being seriously cut short by prolonged dry weather —a circumstance which seems to advertise want of common prudence, we may almost say inexcusable neglect, in failing to provide suitable food for the cows to meet a common emergency, and one to which dairy stock all over the country are always liable. It is a good time now for those who are suffering by such needless losses to consider how easily all their losses might have been prevented: and, when they do so, it is to be hoped they will frankly take the blame home where it belongs, and not wickedly charge it to Providence.



CHANGED CHAMPLAIN. FROM LIFE. SEE PAGE 587—"PROGRESS OF RURAL WHEATS." FIG. 426.

Seventy-seven different kinds of wheat were raised at the Rural Farm the past season. Most of these were new varieties, the best of which are to be cultivated for future Free Seed Distributions.

Poultry.

HOW TO HAVE EGGS IN WINTER.

JUST now the old hens are inclined to brood. A hen is not a perpetual-motion machine for converting corn into eggs, and sometimes she will require a rest. This is absolutely necessary for the production of the ovules in the ovaries, from which the eggs proceed.

It has been said by some persons who profess to know more than they really do know, that a hen has a certain number of these ovules or egg-germs in the ovaries and that she will lay just so many eggs, and if properly fed and kept will keep on laying until the ovaries are exhausted and the original stock of germs is used up. Then her occupation is gone. This is not correct. It might as well be said that all the feathers of a hen, produced during her life and after her annual molts, are existing in the skin at one time, and if the hen should live so long as to exhaust the supply she must wear her last coat continuously or go naked.

The fact is that the egg-germs or ovules are continually produced from the cell substance furnished by the blood, just as the flesh and fat and feathers are formed when new supplies are required. It is a parallel case with a vegetable as with an animal, for as the annual leaves and blossoms and fruit are formed of cell matter furnished by the sap at the right season and under the force of circumstances, so the cell matter for the formation of eggs is constantly

supplied in proportion to the vital force and circumstances of the hen. It has been said that a hen has but 600 ovules in the ovaries and that these are expended during the four or six years in which she is productive. This is mere fancy, and is erroneous. A Brown Leghorn hen has lived 10 years and laid over 2,000 eggs. The writer owns a Plymouth Rock hen that is now seven years old and has laid more than 1,300 eggs, and in her eighth year is laying six eggs weekly. But if the food is reduced the hen will stop laying as surely as a mill without grist will stop paying out flour. In very cold weather, too, and when sick with the roup or the snuffles, this hen stops laying; other cases of similar import are not rare, so that we may be sure that the production of eggs is a matter of management, and not one fixed *ab initio* when the chick was in the shell or, indeed, what is also implied in such a case, when the egg was formed in the ovary of the parent fowl. Indeed one cannot tell how far to go back in such a case.

Well, then, let it be repeated: the old hens are inclined to brood, and if we want eggs next Winter we must let them brood, if it is only upon a chalk egg or a hard-boiled one. We don't want chickens at this late season. But the hen needs a rest, and at this time, when eggs are cheap, she may very well take her vacation and a rest and lay up material for eggs to be laid in the next few months. She must be well fed meanwhile. Put her in a comfortable, clean place with a heap of corn, some gravel, dry sand or ashes, and fresh water every day, and let her rest in peace. Next month she will leave her nest wondering, perhaps, why that chicken did not come, and after a few days will begin to lay, and by November she will be down to her work filling the basket—provided always that the materials are supplied in abundance, as corn, wheat, buckwheat and fresh water.

Apiarian.

PRACTICAL HINTS IN APICULTURE.

PROFESSOR A. J. COOK.

It is the object of this paper to call attention to a few practical questions in apiculture, which in the opinion of the writer are not sufficiently considered even by many of our best bee-keepers.

Poor Queens.—How often do we notice, in reading the reports of bee-keepers, that some colony in the apiary gave results that far eclipsed those given by most of the others; while others seemed to gather but little more than their own needs required. Every attentive apiarist who observes closely, has noted the same fact in his own experience. The conclusion is obvious: some queens are superior, while others are practically worthless. The most successful cattle breeders, even with the best breeds, find that to achieve the best results they must continually weed out from their herds, selling off those that vary from the highest standard of excellence, and valuing above price some members of their herds. Bees are no exception to this law, and that apiarist is most wise who closely watches his bees, killing the poor and worthless queens that are sure to appear, and supplying their places with others reared from queens and, so far as possible, mated to drones, which are the descendants of the choicest queens in his bee-yard. My first advice then is: Don't retain any but the very best queens. Constantly improve, by the most severe selection, the quality of your bees.

Stimulative Feeding.—It is well known to all students of apiculture that have had experience with Italian and German bees, that breeding ceases whenever the bees fail to find honey. But to keep the colonies strong we must secure continuous breeding, which can be secured by feeding a little each day whenever breeding ceases from a failure of the honey harvest. Neglect of a little thoughtful care in this direction takes largely from the pockets of our bee-keepers. With the new Syrian bees this seems unnecessary, as they breed continuously irrespective of the honey harvest.

Strong Colonies.—Another great error consists in tolerating weak colonies in the bee-yard. The heading of this paragraph is the golden rule in apiculture, in Spring, in Autumn, indeed, at all seasons; if neglect has brought weak colonies, unite them, as weak colonies give no returns, and are sure to fall an easy prey to the bee-moth, to robbers, and to the other ills that stand in the way of success.

Increase of Colonies Prevented.—To secure strong colonies, preparatory to a large yield of surplus comb-honey, and not to thwart our own plans by inducing the swarming fever, has been the sore puzzle which has confronted most bee-keepers. True, this is usually accomplished by proper care to ventilate, to shade the hive, and to so increase the space within the hive that the bees shall not become discontented with the old home and essay to move out into a new. Yet who has not found that, despite all these precautions, the bees will sometimes reject all overtures in their mad fury to move into new quarters? In case this inordinate desire to swarm is manifest, there is still a way to satisfy the bees without lessening the working force in the hive. If the bees seem determined to swarm usually there are several cases: if there is one, let the first swarm be placed in a new hive. When the second swarm—I refer to a swarm from some other hive—comes out, it will likely be on the same day; put this in the hive that swarmed first, after having destroyed all the queen cells in that hive. This colony is just as strong now as it was before, in brood and bees, and the bees will be satisfied to settle down to work in the sections. A third swarm can be put in the hive from which came the second swarm; a fourth into the third, etc., etc. We thus have increased but one, have satisfied the bees and still have kept all the colonies strong. If desired, at the last we may unite the swarm that issued first with the young bees and brood left in the hive from which issued the last swarm, in which case we have not increased our number at all. If we now give plenty of room there will be no further attempt to swarm, and we are almost sure to secure the best results in surplus honey.

How to Induce Work in the Sections.—Young bee-keepers are often at a loss how to get the bees to go into the sections. First, all other space except that occupied by the sections, should be filled either with brood or stores. This is usually enough. If not, an arrangement by which we may place the sections in the brood chamber, or above at will, will aid us. If placed below till the bees get well at work in them, and then removed above, the bees will almost always continue to work in them. The bees may often be induced to work in sections above the brood chamber by simply placing a little drone brood in one or two of the sections. As the brood hatches the bees will fill the empty cells with honey and all is well.

Michigan Agr'l Col.

B. Pickman Mann, of Cambridge, Mass., says: "For years I have taken the leading agricultural journals, and they all seem tame when compared with the Rural New-Yorker.

Arboricultural.

THE DIAMOND WILLOW.

EX-GOV. ROBT. W. FURNAS.
